There is a project for starting a manufactory of perfumes in Algeria, originating in M. Millon’s ingenious researches. In a description of his process, we are told that, ‘to avoid the alterations which flowers undergo on drying or distillation, he separates the aromatic part by dissolving it in a very volatile liquid, which is afterwards expelled by distillation. With such a solvent, the distillation is attended by no inconvenience, for it may be performed at a low temperature.’ The best solvents are ether and sulphuret of carbon. ‘Properly managed, there is very little loss of the solvent, and the distillation is rapidly performed, much more rapidly, and with a larger quantity of leaves and flowers, than by the ordinary method. But the gathering of the flowers should be done at the proper time of day for each flower. Thus, the carnation gives off its perfume after an exposure of two or three hours to the sun. Roses, on the contrary, should be gathered in the morning as soon as well open; the jasmine before sunrise.’ By this process the perfume becomes isolated, and may be kept exposed to the air for years without alteration. The project becomes important by the side of the fact, that the annual value of the perfumes exported from France is 30,000,000 francs.

Last year, in consequence of accidents arising out of the use of brine in food, the Council of Health of Paris were charged to inquire into the subject. We reproduce a passage from their report: ‘The use of brine as a condiment or seasoning in the nutriment of man has hitherto had no injurious effect, and nothing authorises the opinion that an economical process so advantageous for the poor should be proscribed. The same is not true of the abuse which is made of this substance in the nourishment and in the treatment of the diseases of certain animals, especially swine and horses. Authentic facts and recent experiments shew that the mixture of brine in considerable quantity with food may produce real poisoning. In all cases, brine preserved too long or in contact with rancid meat should not be employed except with the greatest care, and after it has been purified by skimming off all the scum which forms on the surface.’

By way of conclusion—Mr Tooke has published the last volume of his *History of Prices*. Having now exceeded the age of fourscore, he leaves the continuation of the interesting subject to younger hands. Three striking points come out on perusal of the book, which, in brief, are, that in Mr Tooke’s opinion, the rate of

interest will not for a long time, if at all, be lower than at present; that the price of provisions will rise rather than fall; and that a great financial crash is imminent in France.

WOMEN'S RIGHTS.

The Amazons in New York have commenced this year's campaign by petitioning the legislature for women's rights. The petition is referred to the judiciary committee, of which it is supposed Judge Fort will be the chairman. Last session, this judge gave the following report on the same question: 'The petitioners ask that there may be established by law an equality of rights between the two sexes. The judiciary committee is composed of married and single gentlemen. The bachelors on the committee, with becoming diffidence, have left the subject pretty much to the married gentlemen. These have considered it with the aid of the light they have before them, and the experience married life has given them. Thus aided, they are enabled to state that ladies have the best piece and choicest titbit at table, the warmest place in winter, and the coolest place in summer. They have their choice on which side of the bed they will lie, front or back. A lady's dress costs three times as much as that of a gentleman; and at the present time, with the prevailing fashion, one lady occupies three times as much space in the world as a gentleman. It has thus appeared to the married gentlemen of your committee, being a majority—the bachelors being silent for the reasons mentioned, and also, probably, for the further reason that they are still suitors for the favours of the gentler sex—that if there is any inequality or oppression in the case, the gentlemen are the sufferers. They, however, have presented no petition for redress, having doubtless made up their minds to yield to an inevitable destiny. On the whole, the committee have concluded to recommend no measure, except that, as they have observed several instances in which husband and wife have both signed the same petition—in such case they would recommend the parties to apply for a law authorising them to change dresses, so that the husband may wear the petticoats, and the wife the breeches, and thus indicate to their neighbours and the public the true relation in which they stand to each other.'

FISHING IN CHINA.

It has been supposed that nearly a tenth of the population derive their means of support from fisheries. Hundreds and thousands of boats crowd the whole coast of China—sometimes acting in communities, sometimes independent and isolated. There is no species of craft by which a fish can be inveigled which is not practised with success in China—every variety of net, from vast seines embracing miles, to the smallest hand-flet in the care of a child. Fishing by night, and fishing by day—fishing in moonlight, by torchlight, and in utter darkness—fishing in boats of all sizes—fishing by those who are stationary on the rock by the sea-side, and by those who are absent for weeks on the wildest of seas—fishing by cormorants—fishing by divers—fishing with lines, with baskets, by every imaginable decoy and device. There is no river which is not staked to assist the fisherman in his craft. There is no lake, no pond, which is not crowded with fish. A piece of water is nearly as valuable as a field of fertile land. At daybreak, every city is crowded with sellers of live fish, who carry their commodity in buckets of water, saving all they do not sell to be returned to the pond or kept for another day's service.—*Sir John Bowring in the Transactions of the China Branch of the Royal Asiatic Society, Part V.*

IDENTITY OF DYAK AND EUROPEAN GAMES.

Games are practised among them, some of which astonished us by their similarity to those practised by the peasantry of Europe; particularly that of climbing up a large pole, previously greased to render the achievement difficult of performance, and to the top of which a piece of pork is attached. The meat is the reward of the person

whose agility renders him the first to attain this eminence, and the frequent failures in the attempts call forth from the gazing crowds bursts of laughter as loud and long-continued as from those who gaze at the similar spectacle at an English country-fair. . . . I observed the children playing at peg-top precisely as do those of England; but their tops had no iron pegs, and more resembled those which at school we used to call whipping-tops. I looked on the game with delight, and saw the spinning-top, the mark for the others, receive several smart blows; but they appeared to be of very hard wood, and though driven to some distance, were never broken.—*Low's Sarawak.*

D A Y.

NIGHT's shades are waning fast—approaching Dawn,
A gray dim phantom, creeps along the sky,
With ashen lips, and face all blanched and wan,
And silver-dusky eyes of vacancy,
And spectral form revealed mysteriously
Down to her ghostly middle, and the rest
All lost in pearly mist, that floatingly
Seems her gray garments trailing low on Earth's
expansive breast.

With cold wan breath that dims the shivering star,
She parts the sable curtains of the night,
And the east portal of the sky unbars—
And straight a shower of faintest purple light
Plays strangely round her brow of dusky white
With mystic glimmer—and her wavering form
Wanes in dissolving radiance from the sight,
As grow the herald tints of day more eloquent and
warm.

Pale amber waves of light, in billowy floods,
Surge grandly in upon the waking sky,
With soft faint green, like tint of April woods,
And rich warm crimson, blent exquisitely—
Till misty hills blush with the brilliancy,
And on their glowing tops stands laughing Day
With outspread wings, steeped in each gorgeous dye,
And crown of radiant horny beams, that round her
temples play.

Clad in his own bright loveliness he stands—
Blue floating eyes look on the world below,
And burnished hair, loosed from its gleaming bands,
Falls o'er his frame with undulating flow—
Red beamy lips, and cheeks of ruddy glow,
Fresh flowery zone, and fair green-sandalled feet,
And fleecy robes that flutter to and fro
In the pure healthful radiant gush of his own
breathings sweet.

Laughing he stands, and floods of sunny light
From each fair burning tress shakes down on earth,
And views with smiles his seraph-image bright
That the sweet waking waters mirror forth—
Till Nature stirs, and with a smile of mirth
Unveils her placid face, all fresh with dews,
And lifts her temples for that gift of worth,
The crown of Light, flung sparkling down from the
bright hands profuse!

A WOMAN'S THOUGHTS ABOUT WOMEN.

SOMETHING TO DO.

I PREMISE that these thoughts do not include *married women*, for whom there are always plenty to think, and who generally think quite enough of and for themselves: therefore let them be! They have cast their lot for good or ill, have realised in greater or less degree the natural vocation of our sex—woman joined to man. They must find out its comforts and its responsibilities, and e'en make the best of both. It is the single women, belonging to those supernumerary pale ranks, which, political economists tell us, are yearly increasing, who most need thinking about.

First, in their early estate, when they have so much in their possession—youth, bloom, and health giving them that temporary influence over the other sex which may result, and is meant to result, in a permanent one. Secondly, when this sovereignty is passing away, the chance of marriage lessening, or wholly ended, or voluntarily set aside, and the individual making up her mind to what, as respect for Grandfather Adam and Grandmother Eve must compel us to admit, is an unnatural condition of being.

Why this undue proportion of single women should almost always result from over-civilisation, and whether, since society's advance is usually indicated by the advance, morally and intellectually, of its women—this progress, by raising women's ideal standard of the 'holy estate,' will not necessarily cause a decline in the very unholy estate which it is most frequently made—are questions too wide to be entered upon here. I have only to deal with facts—with a certain acknowledged state of things, perhaps impossible of remedy, but by no means incapable of amelioration.

But, granted these facts, and leaving to wiser heads their cause and their cure, I, a woman, have a right to say my say—out of practical observation and experience. And looking around upon the middle-classes, which form the staple stock of the community, it appears to me that the chief canker at the root of women's lives is the want of something to do.

Herein I refer, as this chapter must be understood especially to refer, not to those whom ill or good fortune queries, is it not often the latter?—has forced to earn their bread; but to 'young ladies,' who have never been brought up to do anything. Tom, Dick, and Harry, their brothers, has each had it knocked into him from school-days that he is to do something, to be somebody. University, house, shop, or college, afford him a clear path on which to concentrate all his energies and efforts. He has got the grand *pabulum* of the human

soul—occupation. If any inherent want in his character, any unlucky combination of circumstances, nullify this, what a poor creature the man becomes!—what a dawdling, moping, sitting-over-the-fire, thumb-twiddling, lazy, ill-tempered animal! And why? 'Oh, poor fellow! 'tis because he has got nothing to do!'

Yet this is precisely the condition of women for a third, a half, often the whole of their existence.

That Providence ordained it so—made men to work, and women to be idle—is a doctrine that few will be bold enough to assert openly. Tacitly, they do, when they preach up lovely uselessness, fascinating frivolity, delicious helplessness—all those polite impertinences and poetical degradations to which the foolish, lazy, or selfish of our sex are prone to incline an ear, but which any woman of common sense must repudiate as insulting not only her womanhood, but its Creator.

Equally blasphemous, and perhaps even more harmful, is the outcry about 'the equality of the sexes;' the frantic attempt to force women—who, nine-tenths of them, are ignorant of and unequal for their own duties—into the position and duties of men. A pretty state of matters would ensue! Who that ever listened for two hours to the verbose confused inanities of a ladies' committee, would incontinently go and give his vote for a female House of Commons? or who, on the receipt of a lady's letter of business—I speak of the average—would wish thereupon to have our courts of justice stocked with matronly lawyers, and our colleges thronged by

Sweet girl-graduates with their golden hair?

As for finance, in its various branches—if you pause to consider the extreme difficulty there always is in balancing Mrs Smith's housekeeping-book, or Miss Smith's quarterly allowance, I think, my dear Paternal Smith, you need not be much afraid lest this loud acclaim for 'women's rights' should ever be more than 'great cry and little wool.'

No; equality of the sexes is not in the nature of things. Man and woman were made for, and not like one another. One only 'right' we have to assert with the opposite sex—and that is as much in our own hands as theirs—the right of having something to do.

That both sexes were meant to labour—one 'by the sweat of his brow;' the other, 'in sorrow to bring forth'—and bring up—'children'—cannot, I fancy, be questioned. Nor, when the gradual changes of the civilised world, or some special destiny, chosen or compelled, have prevented that first, highest, and in earlier times almost universal lot, does this accidental fate in any way abrogate the necessity, moral, physical,

and mental, for a woman to have occupation, in other forms.

But how few parents ever consider this? Tom, Dick, and Harry, aforesaid, leave school and plunge into life; 'the girls' likewise finish their education, come home, and stay at home. That is enough. Nobody thinks it needful to waste a care upon them. Bless them, pretty dears, how sweet they are! papa's nose-gay of beauty to adorn his drawing-room. He delights to give them all they can desire—clothes, amusements, society; he and mamma together take every domestic care off their hands; they have abundance of time and nothing to occupy it; plenty of money, and little use for it; pleasure without end, but not one definite object of interest or employment; flattery and flummery enough, but no solid food whatever to satisfy mind or heart—if they happen to possess either—at the very emptiest and most craving season for both. They have literally nothing whatever to do, except to fall in love; which they accordingly do, the most of them, as fast as ever they can.

'Many think they are in love, when, in fact, they are only idle'—is one of the truest sayings of that great wise bore, Imlac, in *Rasselas*, and it has been proved by many a shipwrecked life, of girls especially. This 'falling in love,' being usually a mere delusion of the fancy, and not the real thing at all, the object is generally unattainable or unworthy. Papa is displeased, mamma somewhat shocked and scandalised; it is a 'foolish affair,' and no matrimonial results ensue. There only ensues—what?

A long dreary season, of pain real or imaginary, yet not the less real because it is imaginary, of anger and mortification, of impotent struggle—against unjust parents, the girl believes, or, if romantically inclined, against cruel destiny. Gradually this mood wears out; she learns to regard 'love' as folly, and turns her whole hope and aim to—matrimony! matrimony in the abstract; not the man, but any man—any person who will snatch her out of the dulness of her life, and give her something really to live for—in short, something to do.

Well, the man may come, or he may not. If the latter melancholy result occurs, the poor girl passes into her third stage of young-ladyhood, fritters or mopes away her existence, sullenly bears it, or dashes herself blindfold against its restrictions; is unhappy, and makes her family unhappy; perhaps herself cruelly conscious of all this, yet unable to find the true root of bitterness in her heart: not knowing exactly what she wants, yet aware of a morbid, perpetual want of something. What is it?

Alas! the boys only have had the benefit of that well-known juvenile apothegm, that

Satan finds some mischief still
For idle hands to do:

it has never crossed the parents' minds that the rhyme could apply to the delicate digital extremities of the daughters.

And so their whole energies are devoted to the massacre of old Time. They prick him to death with crochet and embroidery needles; strum him deaf with piano and harp playing—not music; cut him up with morning-visitors, or leave his carcass in ten-minute parcels at every 'friend's' house they can think of. Finally, they dance him defunct at all sort of unnatural hours; and then, rejoicing in the excellent excuse, smother him in sleep for a third of the following day. Thus he dies, a slow, inoffensive, perfectly natural death; and they will never recognise his murder till, on the confines of this world, or from the unknown shores of the next, the question meets them: 'What have you done with Time?'—Time, the only mortal gift bestowed equally on every living soul, and,

excepting the soul, the only mortal loss which is totally irretrievable.

Yet this great sin, this irredeemable loss, in many women, arises from their ignorance. Men are taught as a matter of business to recognise the value of time, to apportion and employ it: women, rarely or never. The most of them have no definite appreciation of the article as a tangible divisible commodity at all. They would laugh at a mantua-maker who cut up a dress-length into trimmings, and then expected to make out of two yards of silk a full skirt. Yet that the same laws of proportion should apply to time and its measurements—that you cannot dawdle away a whole forenoon, and then attempt to cram into the afternoon the entire business of the day—that every minute's unpunctuality constitutes a debt or a theft (lucky, indeed, if you yourself are the only party robbed or made creditor thereof!): these slight facts rarely seem to cross the feminine imagination.

It is not their fault; they have never been 'accustomed to business.' They hear that with men 'time is money;' but it never strikes them that the same commodity, equally theirs, is to them not money, perhaps, but *life*—life in its highest form and noblest use—life bestowed upon every human being, distinctly and individually, without reference to any other being, and for which every one of us, married or unmarried, woman as well as man, will assuredly be held accountable before God.

My young-lady friends, of from seventeen upwards, your time, and the use of it, is as essential to you as to any fathers or brothers of you all. You are accountable for it just as much as they are. If you waste it, you waste not your substance, but your very souls—and that which is your own, but your Maker's.

Ay, there the core of the matter lies. From the hour that honest Adam and Eve were put into the garden, not—as I once heard some sensible preacher observe—'not to be idle in it, but to dress it and to keep it,' the Father of all has never put one man or one woman into this world without giving them something to do there, in it and for it: some visible, tangible work to be left behind them when they die.

Young ladies, 'tis worth a grave thought—what, if called away at eighteen, twenty, or thirty, the most of you would leave behind you when you die? Much embroidery, doubtless; various pleasant, kindly, illegible letters; a moderate store of good deeds; and a cart-load of good intentions. Nothing else—save your name on a tomb-stone, or lingering for a few more years in family or friendly memory. 'Poor dear!—! what a nice lively girl she was.' For what benefit accruing through you to your generation, you might as well never have lived at all.

But 'what am I to do with my life?' as once asked me one girl out of the numbers who begin to feel aware that, whether marrying or not, each possesses an individual life, to spend, to use, or to lose. And herein lies the momentous question.

The difference between man's vocation and woman's seems naturally to be this—one is abroad, the other at home: one external, the other internal: one active, the other passive. He has to go and seek out his path; hers usually lies close under her feet. Yet each is as distinct, as honourable, as difficult; and whatever custom may urge to the contrary—if the life is meant to be a worthy or a happy one—each must resolutely and undoubtedly be trod. But—*how?*

A definite answer to this question is simply impossible. So diverse are characters, tastes, capabilities, and circumstances, that to lay down an absolute line of occupation for any six women of one's own acquaintance, would be the merest absurdity.

'Herein the patient must minister to herself.' To her is the choice so easy, and the field of duty so unlimited, that she need puzzle very long over what she ought to

do. Generally—and this is the best and safest guide—she will find her work lying very close at hand: some deontological tastes to condense into regular studies—some faulty household quietly to remodel—some child to teach, or parent to watch over; or, all these being needless or unattainable, to try and extend her service out of the home into the world, which perhaps never at any time so much needed the help of us women. And hardly one of its charities and duties can be done so thoroughly as by a wise and tender woman's hand.

Here occurs another of those plain rules which are the only guidance possible in the matter—a Bible rule, too—'*Whatsoever thy hand findeth to do, do it with thy might.*' Question it not, philosophise not over it—do it!—only do it! Thoroughly and completely, never satisfied with less than perfectness. Be it ever so great or so small, from the founding of a village-school to the making of a collar—do it 'with thy might;' and never lay it aside till it is done.

Let each day's account leave this balance—of something done. Something beyond mere pleasure, one's own or others'—though both are good and sweet in their way. Let the superstructure of life be enjoyment, but let its foundation be in solid work—daily, regular, conscientious work: in its essence and results as distinct as any 'business' of men. What they expend for wealth and ambition, shall not we offer for duty and love—the love of our fellow-creatures, or, far higher, the love of God?

'Labour is worship,' says the proverb: also—nay, necessarily so—labour is happiness. Only let us turn from the dreary, colourless lives of the women, old and young, who have nothing to do, to those of their sisters who are always doing something—women who, believing and accepting the universal law, that pleasure is the mere accident of our being, and work its natural and most holy necessity, have set themselves steadily to seek out and fulfil theirs.

These are they who are little spoken of in the world at large. I do not include among them those whose labours should spring from an irresistible impulse, and become an absolute vocation, or it is not worth following at all—namely, the 'gifted' women, writers, painters, musicians, and the like. I mean those women who lead active, intelligent industrious lives: lives complete in themselves, and therefore not giving half the trouble to their friends that the idle and foolish virgins do—no, not even in love-affairs. If love comes to them accidentally, or rather providentially, and happily, so much the better!—they will not make the worse wives for having been busy maidens. But the 'tender passion' is not to them the one grand necessity that it is to aimless lives; they are in no haste to wed: they have got something to do; and if never married, still the habitual faculty of usefulness gives them in themselves and with others that obvious value, that fixed standing in society, which will for ever prevent their being drifted away, like most old maids, down the current of the new generation, even as dead May-flies down a stream.

They have made for themselves a place in the world: the harsh, practical, yet not ill-meaning world, where all find their level soon or late, and where a frivolous young maid, sunk into a helpless old one, can no more expect to keep her pristine position, than a last year's leaf to flutter upon a spring bough. But an old maid who deserves well of this same world, by her ceaseless work therein, having won her position, keeps it to the end.

Not an ill position either, or unkindly; often higher and more honourable than that of many a mother of ten sons. In households, where 'Auntie' is the universal referee, nurse, playmate, comforter, and counsellor: in society, where 'that nice Miss So-and-so,' though neither clever, handsome, nor young, is yet impossible to be omitted or overlooked: in charitable works,

where she is 'such a practical body—always knows exactly what to do, and how to do it:' or perhaps, in her own house, solitary indeed, as every single woman's home must be, yet neither dull nor unhappy in itself, and the nucleus of cheerfulness and happiness to many another home besides.

She has not married. Under heaven, her home, her life, her lot, are all of her own making. Bitter or sweet they may have been—it is not ours to meddle with them, but we can any day see their results. Wide or narrow as her circle of influence appears, she has exercised her power to the uttermost, and for good. Whether great or small her talents, she has not let one of them rust for want of use. Whatever the current of her existence may have been, and in whatever circumstances it has placed her, she has voluntarily wasted no portion of it—not a year, not a month, not a day.

Published or unpublished, this woman's life is a goodly chronicle, the title-page of which you may read in her quiet countenance; her manner, settled, cheerful, and at ease; her unflinching interest in all things and all people. You will rarely find she thinks much about herself; she has never had time for it. And this her life-chronicle, which, out of its very fullness, has taught her that the more one does, the more one finds to do—she will never flourish in your face, or the face of Heaven, as something uncommonly virtuous and extraordinary. She knows that, after all, she has simply done what it was her duty to do.

But—and when her place is vacant on earth, this will be said of her assuredly, both here and Otherwhere—'*She hath done what she could.*'

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LX.—THE SOMBERERO.

The horses cowered under the cold rain, all of them jaded and hungry. The hot dusty march of the morning, and the long rough gallop of the night, had exhausted their strength; and they stood with drooped heads and hanging ears, dozing and motionless.

The men, too, were wearied—some of them quite worn out. A few kept their feet, bridle in hand, under shelter of the impending cliff; the others, having staggered down, with their backs against the rock, had almost instantly fallen asleep.

For me was neither sleep nor rest; I did not even seek protection against the storm, but standing clear of the cliff, received the drenching shower full upon my shoulders. It was the chill rain of the 'norther;' but at that moment neither cold *norte* nor hot *sirocco* could have produced upon me an impression of pain. To physical suffering I was insensible. I should even have welcomed it, for I well understood the truth, proverbially expressed in that language, rich above all others in proverbial lore—'*un clavo saca otro clavo,*' and still more fully illustrated by the poet:

*Tristesas me hacen triste,
Tristesas salgo a buscar,
A ver si con tristezas
Tristesas puedo olvidar.*

Yes, under any other form, I should have welcomed physical pain as a neutraliser of my mental anguish; but that cold norther brought no consolation.

Sadly the reverse. It was the harbinger of keen apprehension; for not only had it interrupted our search, but should the heavy rain continue but for a few hours, we might be able neither to find or further

to follow the trail. It would be *blinded*—obliterated—lost. Can you wonder that in my heart I execrated those black clouds, and that driving deluge?—that with my lips I cursed the sky and the storm, the moon and the stars, the red lightning and the rolling thunder?

My anathema ended, I stood in sullen silence leaning against the body of my brave horse, whose sides shivered under the chilly rain, though I felt not its chill.

Absorbed in gloomy thought, I recked not what was passing around me; and for an unnoted period I remained in this speechless abstraction.

My reverie was broken. Some expressions that reached my ear told me that at least two of my followers had not yet yielded to weariness or despair. Two of them were in conversation; and I easily recognised the voices of the trappers. Tireless, used to stern struggles—to constant warfare with the elements, with nature herself—these true men never thought of giving up, until the last effort of human ingenuity had failed. From their conversation, I gathered that they had not yet lost hope of finding the trail, but were meditating on some plan for recovering and following it.

With renewed eagerness I faced towards them and listened; both talked in a low voice. Garey was speaking, as I turned to them.

'I guess you're right, Rube. The hoss must a gone thar, an if so, we're boun' to fetch his tracks. Thar's mud, if I remember right, all roun' the pool. We can carry the candle under Dutch's sombrero.'

'Ye-es,' drawled Rube in reply; 'an ef this niggur don't miskalk'late, we ain't a gwine to need eyther cannell or sombrairay. Lookkee yander!'—the speaker pointed to a break in the clouds—'I'll stake high, I kin mizyure this hyur shower wi' the tail o' a goat. Wagh! we'll hev the moon agin, clur as iver in the inside o' ten minnits—see ef we haint.'

'So much the better, old hoss; but hadn't we best first try for the tracks; time's precious, Rube'—

'In coorse it ur; git the cannell an the sombrairay, an le's be off then. The rest o' these fellurs hed better stay hyur; thu'll only bamfoozle us.'

'Lige!' called out Garey, addressing himself to Quackenboss—'Lige! gi' us yur hat a bit.'

A loud snore was the only reply. The ranger, seated with his back against the rock, and his head drooping over his breast, was sound asleep.

'Durned sleepyhead!' exclaimed Rube, in a tone of peevish impatience. 'Prod 'im wi' the point o' yur bowie, Bill! Rib-roast 'im wi' yur wipin-stick! Lam 'im wi' yur laryette!—gi' 'im a kick i' the guts!—roust 'im up, durn 'im!'

'Lige!—ho!—Dutchy!' cried Garey, approaching the sleeper, and shaking him by the shoulder; 'I want your sombrero.'

'Ho! wo! stand still! Jingo, he'll throw me. I can't get off; the spurs are locked. Ho! wo! wo!'

Rube and Garey broke into a loud cachinnation that awakened the rest of the slumberers. Quackenboss alone remained asleep, fighting in his dreams with the wild Indian horse.

'Durned mulehead!' cried Rube after a pause; 'let 'im go on at thet's long's he likes it. Chuck the hat off o' his head, Bill! we don't want *him*—thet we don't.'

There was a little pique in the trapper's tone. The breach that the ranger had made, while acting as a faithful sentinel, was not yet healed.

Garey made no further attempts to arouse the sleeper, but in obedience to the order of his comrade,

lifted off the hat; and, having procured one of the great candles, he and Rube started off without saying another word, or giving any clue to their design.

Though joyed at what I had heard, I refrained from interrogating them. Some of my followers who put questions received only ambiguous answers. From the manner of the trappers, I saw that they wished to be left to themselves; and I could well trust them to the development of whatever design they had conceived.

On leaving us, they walked straight out from the cliff, but how far they continued in this direction it was impossible to tell. They had not lighted the candle; and after going half-a-dozen steps, their forms disappeared from our view amidst the darkness and thickly falling rain.

CHAPTER LXI.

THE TRAIL RECOVERED.

The rangers, after a moment of speculation as to the designs of the trappers, resumed their attitude of repose. Fatigued as they were, even the cold could not keep them awake.

After a pause, the voice of Quackenboss could be heard, in proof that that heavy sleeper was at length aroused; the rain falling upon his half-bald skull had been more effective than the shouts and shaking of Garey.

'Hillo! Where's my hat?' inquired he in a mystified tone, at the same time stirring himself, and groping about among the rocks. 'Where is my hat? Boys, did any o' ye see anything o' a hat, did ye?' His shouts again awoke the sleepers.

'What sort of a hat, Lige?' inquired one.

'A black hat—that Mexican sombrero.'

'Oh! a black hat; no—I saw no black hat.'

'You darned Dutchman! who do you expect could see a black hat such a night as this, or a white one eyther? Go to sleep!'

'Come, boys, I don't want none o' your nonsense: I want my hat. Who's got my hat?'

'Are you sure it was a black hat?'

'Bah! the wind has carried it away.'

'Pe gar! Monsieur Quack'bosh—votre chapeau grand—you great beeg 'at—est il perdu?—is lost!—c'est vrai? Pardieu! les loups—ze wolfs have it can't away—have it mangé—eat? c'est vrai?'

'None o' your gibberish, Frenchy. Have you got my hat?'

'Moi! votre chapeau grand! No, monsieur. Quack'bosh—vraiment je ne l'ai pas; pe gar, no!'

'Have you got it, Stanfield?' asked the botanist, addressing himself to a Kentucky backwoodsman of that name.

'Dang yar hat! What shed I do wi' yar hat? I've got my own hat, and that's hat enough for me.'

'Have you my hat, Bill Black?'

'No,' was the prompt reply; 'I've got neery hat but my own, and that ain't black, I reckon, 'cept sich a night as this.'

'I tell you what, Lige, old fellow! you lost your hat while you were a ridin the mustang just now: the hoss kicked it off o' your head.'

A chorus of laughter followed this sally, in the midst of which Quackenboss could be heard apostrophising both his hat and his comrades in no very respectful terms. He continued to scramble over the ground in vain search after the lost sombrero, amidst the jokes and laughter, uttered at his expense.

To this merriment of my followers I gave but little heed: my thoughts were intent on other things. My eyes were fixed upon that bright spot in the sky, that had been pointed out by Rube; and my heart gladdened, as I perceived that it was every moment growing brighter and bigger. The rain still fell thick

and fast; but the edge of the cloud-curtain was slowly rising above the eastern horizon, as though drawn up by some invisible hand. Should the movement continue, I felt confident that in a few minutes—as Rube had predicted—the sky would be clear again, and the moon shining brightly as ever. These were joyous anticipations.

At intervals I glanced towards the prairie, and I listened to catch some sound—either the voices of the trappers, or the tread of their returning footsteps. No such sounds could be heard.

I was becoming impatient, when I perceived a sudden waif of light far out upon the plain. It seemed to be again extinguished; but in the same place, and the moment after, appeared a small, steady flame, twinkling like a solitary star through the bluish mist of the rain. For a few seconds it remained fixed, and then commenced moving—as if carried low down along the surface of the ground.

There was nothing mysterious about this lone light. To Quackenboss only it remained an unexplained apparition; and he might have mistaken it for the *fata morgana*. The others had been awake when Rube and Garey took their departure, and easily recognised the lighted candle in the hands of the trappers.

For some time the light appeared to move backwards and forwards, turning at short distances, or as if borne in irregular circles, or in zigzag lines. We could perceive the sheen of water between us and the flame, as though there was a pond, or perhaps a portion of the prairie, flooded by the rain.

After a while the light became fixed, and a sharp exclamation was heard across the plain, which all of us recognised as being in the voice of the trapper Rube. Again the light was in motion—now flitting along more rapidly, and as if carried in a straight line across the prairie.

We followed it with eager eyes. We saw it was moving further and further away; and my companions hazarded the conjecture that the trappers had recovered the trail.

This was soon verified, by one of themselves—Garey—whose huge form, looming through the mist, was seen approaching the spot; and though the expression of his face could not be noted in the darkness, his bearing betokened that he brought cheerful tidings.

'Rube's struck the trail, cap'n,' said he in a quiet voice as he came up: 'yonder he goes, whar you see the bleeze o' the cannon! He'll soon be out o' sight, if we dont make haste, an follow.'

Without another word, we seized the reins, sprang once more into our saddles, and rode off after the twinkling star, that beacons us across the plain.

Rube was soon overtaken, and we perceived that, despite the storm, he was rapidly progressing along the trail, his candle sheltered from the rain under the ample sombrero.

In answer to numerous queries, the old trapper vouchsafed only an occasional 'Wagh,' evidently proud of this new exhibition of his skill. With Garey, the curious succeeded better; and as we continued on, the latter explained to them how the trail had been recovered by his comrade—for to Rube, it appeared, was the credit due.

Rube remembered the mesa spring. It was the water in its branch that we had seen gleaming under the light. The thoughtful trapper conjectured, and rightly as it proved, that the steed would stop there to drink. He had passed along the stony shingle by the mound—simply because around the cliff lay his nearest way to the water—and had followed a dry ridge that led directly from the mesa to the spring-branch. Along this ridge, going gently at the time, his hoof had left no marks—at least none that could be distinguished by torch-light, and this was why the trail had been for the moment lost. Rube, however, remembered that

around the spring there was a tract of soft, boggy ground; and he anticipated that in this the hoof-prints would leave a deep impression. To find them he needed only a 'kiver' for the candle, and the huge hat of Quackenboss offered the very thing. An umbrella would scarcely have been better for his purpose.

As the trappers had conjectured, they found the tracks in the muddy margin of the spring-branch. The steed had drunk at the pool; but immediately after had resumed his wild flight, going westward from the mound.

Why had he gone off at a gallop? Had he been alarmed by aught? Or had he taken fresh affright, at the strange rider upon his back?

I questioned Garey. I saw that he knew why. He needed pressing for the answer.

He gave it at length, but with evident reluctance. 'Thar are wolf-tracks on the trail!'

CHAPTER LXII.

WOLVES ON THE TRACK.

The wolves, then, were after him!

The trackers had made out their footprints in the mud of the arroyo. Both kinds had been there—the large brown wolf of Texas, and the small barking *coyote* of the plains—a full pack there had been, as the trappers could tell by the numerous tracks. That they were following the horse, the tracks also testified to these men of strange intelligence. How knew they this? By what sign?

To my inquiries, I obtained answer from Garey.

Above the spring-branch extended a shelving bank; up this the steed had bounded, after drinking at the pool. Up this, too, the wolves had sprung after: they had left the indentation of their claws in the soft loam.

How knew Garey that they were in pursuit of the horse?

The 'scratches' told him they were going at their fastest, and they would not have sprung so far had they not been pursuing some prey. There were footmarks of no other animal except theirs, and the hoof-prints of the steed; and that they were after him was evident to the trapper, because the tracks of the wolves covered those of the horse.

Garey had no more doubt of the correctness of his reasoning, than a geometrician of the truth of a theorem in Euclid.

I groaned in spirit as I was forced to adopt his conclusion. But it was all probable—too probable. Had the steed been alone—unembarrassed—free—it was not likely the wolves would have chased him thus. The wild-horse in his prime is rarely the object of their attack—though the old and infirm, the gravid mare, and the feeble colt, often fall before these hungry hunters of the plains. Both common wolf and *coyote* possess all the astuteness of the fox, and know, as if by instinct, the animal that is wounded to death. They will follow the stricken deer that has escaped from the hunter; but if it prove to be but slightly harmed, instinctively they abandon the chase.

Their instinct had told them that the steed was not ridden by a free hand; they had seen that there was *something amiss*; and in the hope of running down both horse and rider, they had followed with hungry howl.

Another fact lent probability to this painful conjecture: we knew that by the mesa were many wolves.

The spring was the constant resort of ruminant animals, deer and antelopes; the half-wild cattle of the *ganaderos* drank there, and the tottering calf oft became the prey of the *coyote* and his more powerful congener, the gaunt Texan wolf. There was still another reason why the place must of late have been the favourite prowl of these hideous brutes: the debris of our skirmish had furnished them with many a midnight banquet. They had ravened upon the

blood of men and the flesh of horses, and they hungered for more.

That they might succeed in running down the steed, cumbered as he was, was probable enough. Sooner or later, they would overtake him. It might be after a long, long gallop over hill and dale, through swamp and chapparal; but still it was probable those tough, tireless pursuers would overtake him. They would launch themselves upon his flanks; they would seize upon his wearied limbs—upon hers the helpless victim on his back: both horse and rider would be dragged to the earth—both torn—parted in pieces—devoured!

I groaned under the horrid apprehension.

'Look thar!' said Garey, pointing to the ground, and holding his torch so as to illuminate the surface; 'the hoss has made a slip thar. See! hyar's the track o' the big wolf—he hes sprung up jest hyar; I can tell by the scratch o' his hind-claws.'

I examined the 'sign.' Even to my eyes it was readable, and just as Garey had interpreted it. There were other tracks of wolves on the damp soil, but one had certainly launched himself forward, in a long leap, as though in an effort to fasten himself upon the flanks of some animal. The hoof-mark plainly shewed that the steed had slipped as he sprang over the wet ground; and this had tempted the spring of the watchful pursuer.

We hurried on. Our excited feelings hindered us from pausing longer than a moment. Both rangers and trappers shared my eagerness, as well as my apprehensions. Fast as the torches could be carried, we hurried on.

Shortly after parting from the mesa, there occurred a change in our favour. The lights had been carried under hats to protect them from the rain. This precaution was no longer required. The storm had passed—the shower ceasing as suddenly as it had come on; the clouds were fast driving from the face of the firmament. In five minutes more, the moon would shine forth. Already her refracted rays lightened the prairie.

We did not stay for her full beam; time was too precious. Still trusting to the torches, we hurried on.

The beautiful queen of the night kept her promise. In five minutes, her cheering orb shot out beyond the margin of the dark pall that had hitherto shrouded it, and her white disc, as if purified by the storm, shone with unwonted brightness. The ground became conspicuous almost as in the day; the torches were extinguished, and we followed the trail more rapidly by the light of the moon.

Here, still in full gallop, had passed the wild-horse, and for miles beyond—still had he gone at utmost speed. Still close upon his heels had followed the ravenous and untiring wolves. Here and there were the prints of their clawed feet—the signs of their unflagging pursuit.

The roar of water sounded in our ears: it came from the direction in which the trail was conducting us; a stream was not far distant.

We soon diminished the distance. A glassy sheet glistened under the moonlight, and towards this the trail trended in a straight line.

It was a river—a cataract was near, down which the water, freshened by the late rain, came tumbling, broken by the rocks into hummocks of white foam. Under the moonlight, it appeared like an avalanche of snow. The trappers recognised an affluent of the Rio Bravo, running from the north—from the high steppe of the Llano Estacado.

We hurried forward to its bank, and opposite the frothing rapids. The trail conducted us to this point—to the very edge of the foaming water. It led no further. There were the hoof-marks forward to the brink, but not back. The horse had plunged into the torrent!

CHAPTER LXIII.

ACROSS THE TORRENT.

Surely was it so. Into that seething rapid the steed had launched himself—where the spume was whitest, and the rocks gave out their hoarsest echoes. The four hoof-prints, close together upon the bank, shewed the point from which he had sprung, and the deeply indented turf testified that he had made no timid leap. The pursuers had been close upon his heels, and he had flung himself with desperate plunge upon the water.

Had he succeeded in crossing? It was our first thought. It appeared improbable—impossible. Notwithstanding its foam-bedappled surface, the current was swift, and looked as though it would sweep either man or horse from his footing. Surely it was too deep to be forded. Though here and there rocks were seen above the surface, they were but the crests of large boulders, and between them the impetuous wave ran dark and deep. Had the horse lost footing? had he been forced to swim? If so, he must have been carried with the current—his body submerged—his withers sunk below the surface—his helpless rider—

The conclusion was evident to all of us. All felt the conviction simultaneously. No—not all. There came a word of comfort from the oldest and wisest—a word that gave cheer to my drooping spirit.

'Wagh! the hoss hain't swum a lick—*he hain't*.'

'Are you sure, Rube? How can you tell?' were the quick interrogatories.

'Sure—how kin I tell—i'deed, how,' replied Rube, a little nettled at our having questioned his judgment. 'What the divul's yur eyes good for—all o' yur? Lookse, hyur! and I'll shew ee how I tell. D'ees see the colour o' thet water?—it ur as brown as a bufler in the Fall; thurfor its fresh kin down; and jest afore the shower, thur want more'n half o' it in the channel. Then the hoss mout a waded 'crosst hyur, eary as fallin off a log, and then the hoss *did* wade acrosst.'

'He crossed before the rain?'

'Sure as a shot from Targuts. Look at the tracks! Them wur made afore a drop o' rain kin down: ef they hednt, they'd a been a durned sight deeper in the sod. Wagh! the hoss got safe acrosst 'thout wettin a hair o' his hips. So far as drownin' goes, don't be skeart 'bout that, young fellur! the guri's safe enough yit.'

'And the wolves? Do you think they have followed across the stream?'

'Ne'er a wolf o' 'em—ne'er a one. The vaminits hed more sense. They knowd thur legs wan't long enough, an thet ur current wud a swep 'em a mile afore they kud a swum half-way acrosst. The wolves, they stayed on this side, I reck'n. Look hyur—hyur's thur tracks. Wagh! thur wur a wheen o' the filthy beasts. Geehosopat! the bank ur paddled like a sheep-pen.'

We bent down to examine the ground. Sure enough, it was covered with the tracks of wolves. A numerous band had crowded together on the spot; and as the prints of their feet pointed in all directions, it was evident they had not gone forward, but brought to a stand by the torrent, had given up the chase, and scattered away.

Pray heaven it was no mere conjecture!

With Rube it was a belief; and as I had grown to put implicit reliance in the old trapper's wood-craft, I felt reassured. Rube's opinions, both as to the steed having safely crossed, and the discomfiture of the wolves, were shared by the rest of my followers—not one of whom was a mean authority on such a subject. Garey—second only to his older comrade in the working out of a prairie syllogism—gave Rube's statement his emphatic confirmation. The steed was yet safe—perhaps, too, the rider.

With lighter heart I sprang back into the saddle.

My followers imitated the example, and with eyes scanning the stream, we rode along the bank to seek for a crossing.

There was no ford near the spot. Perhaps where the steed had passed over the stream might have been waded at low-water; but now, during the freshet, the current would have swept off horse and man like so much cork-wood. The rocks—the black waves that rushed between them—the boiling, frothing eddies—discouraged any attempt at crossing there; we all saw that it was impracticable.

Some rode up stream, others went in the opposite direction.

Both parties met again with blank looks; neither had found a crossing.

There was no time to search further—at least my impatience would no longer brook delay. It was not the first time for both my horse and myself to cross a river without ford; nor was it the first time for many of my followers.

Below the rapids, the current ran slow, apparently ceasing. The water was still, though wider from bank to bank—a hundred yards or more. By the aid of the moonlight, I could tell that the bank on the opposite side was low and shelving. It could be easily climbed by a horse.

I stayed to reason no further. Many a hundred yards had Moro swum with his rider on his back—many a current had he cleft with his proud breast many times more rapid than that.

I headed him to the bank, gave him the spur, and went plunging into the flood.

Plunge—plunge—plunge! I heard behind my back till the last of my followers had launched themselves on the wave, and were swimming silently over.

One after another we reached the opposite side, and ascended the bank.

Hurriedly I counted our number as the men rode out; one had not yet arrived! Who was missing?

'Rube,' answered some one.

I glanced back, but without feeling any uneasiness. I had no fear for the trapper; Garey alleged he was 'safe to turn up.' Something had detained him. Could his old mare swim?

'Like a mink,' replied Garey; 'but Rube won't ride her across; he's afeared to sink her too deep in the water. See! yonder he comes!'

Near the middle of the stream, two faces were observed rippling the wave, one directly in the wake of the other. The foremost was the grizzled front of the old mustang, the other the unmistakable physiognomy of her master. The moonlight shining upon both rendered them conspicuous above the dark brown water; and the spectacle drew a laugh from those who had reached the bank.

Rube's mode of crossing was unique, like every action of this singular man. Perhaps he adopted it from sheer eccentricity, or may be in order that his mustang might swim more freely.

He had ridden gently into the water, and kept his saddle till the mare was beyond her depth—then sliding backward over her hips, he took the tail in his teeth, and partly towed like a fish upon the hook, and partly striking to assist in the passage, he swam after. As soon as the mare again touched bottom, he drew himself up over the croup, and in this way regained his saddle.

Mare and man, as they climbed out on the bank—the thin skeleton bodies of both reduced to their slenderest dimensions by the soaking water—presented a spectacle so ludicrous as to elicit a fresh chorus of laughter from his comrades.

I stayed not till its echoes had died away; but pressing my steed along the bank, soon arrived at the rapids, where I expected to recover the trail. To my joy, hoof-marks were there, directly opposite the point

where the steed had taken to the stream. He must have waded then.

Thank heaven! at least from that peril has she been saved!

POOR NUMBER TWO!

If the poor 'creaking wheel' cannot be mended, it is too hard to deny it at least the privilege of complaint. There is something sweet and soothing in knowing that our sufferings are regarded with sympathy and compassion. I consider myself a very hardly used person; but I think my grievances might be remedied if they were only properly made known in the proper quarter.

This society of ours, in England, is composed, locomotively speaking, of numbers 1, 2, and 3. We are ticketed off in business-like style, and sent, with more or less of ceremony, to our respective ends of the train. 'First class higher up, sir; please walk this way!' says an obsequious official, with smiling countenance. 'Second class lower down; make haste!' cries another. 'Third class in front, by the engine; get along, will ye!' shouts a third; and thus we get to our seats at last. Now, I cheerfully take my place in the class number two, and all I ask is that the railway companies should hold to their bargain, and treat me as that number.

It is proverbial that corporations have no consciences, and I am quite sure that no individual shareholder would have the barbarity, if it rested with his individual vote, to condemn me to sit all the way from London to Edinburgh on a hard board, when it is known how small a fraction the use of a cushion would subtract from the fare I have actually paid for my seat. I am reminded that in highly civilised England alone is this misery inflicted on second-class passengers. In Germany, Belgium, France, and Italy, to my certain knowledge, it is not so; and what I require, in all humility, is, a reason why English arrangements are so different. It is, to say the least, an ungracious, grinding, hard-hearted proceeding, to tell all the respectable middling classes of England, that if they cannot afford first-class fares, they shall pay for their deficiency in sore bones. As I have said, economy cannot be the object, for the cost of a little more comfortable accommodation would be absolutely infinitesimal. The plain design is to force as many persons as possible into the first-class carriages, by rendering the second-class as uncomfortable as may be. This argues a short-sighted as well as a selfish view of the matter, as I propose to shew. As long as one class is cheaper than another, it will always be found that a great many persons will prefer the temporary suffering entailed by inconvenient travelling, to the outlay of a larger sum. They do this because they must do it; and it is contemptible to punish them for a laudable spirit of economy. In another point of view, it is short-sighted. As long as the families of clergymen, country doctors, and middling gentry of all sorts, can travel only by submitting either to the too great cost of first-class, or the manifold inconveniences of second-class carriages, so long they will stay at home, except when compelled by necessity to do otherwise. I conceive that if the directors of railway companies are ignorant of this, they know very little of the true state of the case. I have said that they, as corporations, cannot be expected to have either conscience or humanity; and I therefore do not make an appeal to either quality. My object is to shew them that their present system is altogether a mistaken one as regards their dividends.

I speak from personal experience when I say, that their language to the public is: 'We make our own arrangements; you are not obliged by us to travel; and if you don't like what we offer you, you can stay at home.' This is the declaration of war held out by

the companies, and it remains to be seen whether they have adopted the wiser course. I am not one of those who wish to travel at the expense of the shareholders: all I wish them to understand is this, that they get far less out of me in the long-run by taking up the tone they have assumed, than if they met me half-way in a conciliating spirit.

It is my private opinion, that as railways are entirely a parliamentary institution, parliament should superintend all the details of the system which it has created and forced upon the public, as well as the daily government-train. Failing this, it only remains that those who feel with me should endeavour to obtain a fair consideration of their claims. The object I have in view is not that fares should be lower than at present. I may think that it would pay better to lower them, but I have not the same proof of the fact as of the other things I here allege. What I chiefly complain of is, that second-class passengers are subjected not only to the calm and deliberate infliction of the 'horse-box' system, but that, having paid the stipulated fare, they are not even allowed to enjoy what they have paid for. This is quite evident. It is just as much a trick of the directors to drive third-class passengers, properly so called, into the second-class carriages, as to force these latter into the first: consequently, most trains run only first and second class; and those who are charged a certain price, for the express reason that it is proportionably high enough to keep them select, are compelled to travel with the class below themselves.

Every one knows that, especially in the manufacturing districts, mechanics and working-people are constantly passing and repassing at all hours of the day; they want to get home, or to their destination to-day, at a certain hour—they never think of waiting for the parliamentary train to-morrow. As the stages are commonly short, a few pence or even shillings make but slight difference in comparison with the evil of delay, and the result is, that no third class being provided, they travel second class. Thus, I have seen, between Leeds and Manchester, for example, a constant succession of oily mechanics, some tipsy, some sober, along with hobnailed farm-labourers, and females of anything but respectable appearance, thrust in at every station upon those, who, as I have just said, had paid a second-class fare, expressly with the intention and understanding that they were to be protected—in virtue of that fare—from travelling in company with that class of the community which conventionally is called third or fourth class. It is easy to say: 'These people pay as you do; it is not for us to turn them away.' I know all that perfectly well; but I say that the inevitable result is, that since you will not have carriages by which this class of persons would willingly travel, and since you cannot force me, against my will, to spend money I cannot afford in first-class fares, the result is, that as far as possible, I stay at home. This is not only my own case as an individual, but it affects a numerous party, of which I am the type; and if the real sentiments of our middling gentry could be as frankly expressed in conversation as mine are now, it would be found that the hinderance to travelling effected by the present arrangements is far greater than directors would readily believe. The fact is, that when persons habitually use first class, they have no reason to complain; and those who do not, have a natural shyness in admitting this incident of their social position. I am fully convinced, that a great many people of the class I have in view, endure all the annoyance and suffering entailed on them when they do travel; that they and their families are restrained, just as I and mine are, in their excursions, by the causes stated above; and yet that they shrink from exposing the evil to the eyes of their neighbours, by seeming, even, to know what are the grievances of poor number two. It is more genteel to talk about

the luxury of modern locomotion, to praise the comfortable appointments of first-class carriages, &c., than to complain of aching bones and violated proprieties encountered in second-class.

I know that John Bull is, in some respects, a much-enduring animal; the *Bos piger* is slow to anger, especially when everybody else is in the same pickle as himself; but I confess I never could account to my own mind for the apathy shewn to the grievances of which I complain, except on the principle, that, in the very act, the man who *does* complain, does so at the expense of his gentility.

Do you suppose that those young officers whom I travelled with the other day from Dover to London, and who occupied the inner half of a divided 'horse-box,' would be heard at their club or mess-room inveighing against hard boards and a half-tipsy groom in a shabby livery? No, my brother of the middle rank, we do the thing; we execrate the 'rascally system;' we are up to all its iniquities; we would, if we could, put the whole body of directors for a month to ride, night and day, in a ballast-truck, and think it too good for them: in a word, brothers, we suffer; but we are too genteel to say anything about it. It is just because, for these reasons, there is no chance of bringing to bear on this question a regular pressure of public opinion, that I trust a fair statement of the simple truth, in a popular and widely circulated journal, may have the effect of giving an impulse in the right direction to that mass of discontent, of whose existence I have ample proofs. It may thus come to be suggested to those in power, that they themselves suffer by their ungenerous treatment of the public; and possibly a better state of things may yet be brought about.

I, for one, do complain that, in the fitting-up of second-class carriages, such utter negligence is shewn of the comfort of the traveller; but, supposing the vehicles to remain as they are, is it not monstrous and insulting to the last degree, that no accommodation should be provided in ordinary trains for that class of persons represented by number three? It cannot be expected that these people will be always inoffensive, and always even presentable; but so long as they submit to necessity, and pay the extra fare, they are voted on a par with all second-class passengers, and unhesitatingly ushered into their company. This is not their fault; the blame lies entirely with the cupidity of railway managers, who gladly adopt this additional mode of driving people into first-class fares. Again, even in trains where there are nominally third-class carriages, there is constantly an insufficient number of them, and the surplus passengers are bundled into the second-class. So strongly is this abuse felt, that the project is seriously discussed, of forming a sort of compact among travellers to avoid as much as possible second-class travelling altogether. It is said, with great truth, 'If we must travel without any selection of our company, we may as well save our money, and go third class at once.' It is also certain that foreigners express the most unmitigated astonishment at the English system, and the patience of those who submit to it as if unaware of its hardships and injustice. Still, I am sadly mistaken if, but for their habitual tenderness for their poor gentility, they would not soon let it be known that they are fully aware of their position—that they cordially resent it, but that the only revenge they can take is to stay at home as much as possible.

It can scarcely be, that I am so isolated in my feelings, habits, and circumstances, as that a vast number of persons of moderate fortune do not sympathise in the sentiments I here express. At the moment when I write this, I am leaving home for a journey to the house of a relative some 200 miles distant. But for the expense of first-class travelling, I should have formed probably a party of three

persons. Not that I should have the slightest hesitation in going, accompanied by females, into the second-class, if it only was second-class conveyance. My knowledge, however, of the fact that no third-class carriages run with ordinary trains, and that therefore all sorts of people belonging properly to that class are invariably waiting to be conveyed by such trains as they can get to suit their exigencies, deters me altogether from thinking of increasing my party.

I consider this a perfectly fair illustration of my meaning. My object has been to shew that if a fair and rational regard were had to the reasonable complaints of us middle-class people—if we were left in quiet possession of our own carriages—if they were less in the horse-box style—and if means were not so obviously employed to compel us to 'take a first class,' whether we like it, or can afford it, or not—we should be better customers, and the companies and their dividends would be largely the gainers in the end.

VISITING MY WIFE'S RELATIONS.

My engagement with dearest Carry was a very long one indeed; there were tremendous obstacles in the way, by which the course of our true love was perpetually being brought up short and impeded. Carry is the offspring of the Reverend Claude Winkwerd; which was the son of Geoffrey Winkwerd of the Hall; which was the son of Sir Ralph Winkwerd, knight; at which point that pedigree stopped, for good and sufficient reasons: but she is also the issue of Margaret Lorraine; which was the daughter—by her second marriage with Colonel Slasher—of the Lady Blanche Trevor; which was the daughter of Lord Sleightovand—eighth baron—by which gap the Winkwerd family broke into Burke's *Peerage*, and even got connected in some extremely discreditable manner with royalty itself. Carry was therefore of course entitled to expect a good match, or, in other words, a husband with either blood or money. Now, my ancestral, or (being the second of my race, I should rather say) my paternal, name is Biles, and there is little in my income to excuse it. I had nevertheless enough to live upon, and to maintain my wife in something more than gentility, which was the Winkwerd horror. I could afford her a pony-chaise, that is, and a lady's-maid. The Rev. Claude had also a whole quiver full of daughters besides Carry, and found, perhaps, some little difficulty in supplying every arrow with a beau. Above all, I was an orphan, and had not a relative upon the face of Europe. Anything of that sort would have made our union hopeless; but my two younger brothers—both in the small-coal line—withdrew themselves, fortunately, to South Australia, and have gone under the general head of 'our colonial relations' ever since. They are now considered to be rather subjects of congratulation than disgrace; being always understood and described by my wife's family as a sort of merchant-princes, who head the untitled aristocracy of the other hemisphere.

Nevertheless, my connection with the Winkwerds is what a Biles, without my advantages, would describe as rather ticklish; and there are still such a number of 'ps' and 'qs' to be minded, and so many favourite expressions and quotations to be apologised for when amongst them, that I let the rectory and its inmates, as much as possible, alone. There was always some magnificent person being feasted and flattered up there by Mrs Winkwerd, in preparation for the matrimonial sacrifice, and I felt that I was in the way. 'My eldest daughter, Lady Toppingtower,' was well enough to talk about to people who did not know that her husband, Sir Richard, resided at Boulogne-sur-Mer, and visited his native land on Sundays only. But there was nothing attractive to a possible son-in-law in 'my dear child, Mrs Biles.' Carry was pitted, you see, for her condescension in having parted with herself at

such an alarming sacrifice to me. 'Poor dear Carry,' her sisters said, 'was very happy, they really believed—as if it were the eighth wonder of the world that she should be so; and yet if I were inclined to tell tales, there were others of the same family at one time who laid themselves out pretty distinctly for— But the Bileases were ever a chivalrous race, and I will not be the first of their short line to justify myself at the expense of Blanche, or Rose, or Kitty—of whom, however, I must say one was as bad as the other. Emily, the youngest and prettiest of the Winkwerds, was very different from the rest also in everything else: she was my wife's twin-sister, and the two were as like one another—with the trifling exception of a little mole under Carry's left ear—as a couple of peas. I could not, of course, be always looking for this mole, and I once put my arm round Emily at a picnic, and kissed her behind a lilac-tree, in mistake. 'I suppose, Mr Frederic, you meant it for Carry,' said she good-naturedly, and pretending to be disappointed. My wife took the greatest care after this circumstance to construct a code of signals, whereby we might recognise each other at once; and the accident, so far as I know at least, did not happen again. Emily was a dear good girl, and quite unspoiled, although she was the show-daughter of them all. It was quite clear to my respected mother-in-law that none of the rest would marry—Carry having already degraded herself—while Emily remained in the house single; so that it was determined she should do it at once, and give an opportunity to the three who had less time to spare. She received, to her extreme discomfort, twice the pin-money of any of her sisters, and was continuously apparelled in the most gorgeous array. Her masters for all the arts were increased and multiplied, and she was—if I may be allowed the expression—trotted out before eligible visitors pretty considerably.

I had the privilege of being useful to the family in recommending my old friend Jack Camellair to paint her portrait; and he achieved an admirable likeness. He and I had been great chums at school, but our walks in life had since diverged widely. I stuck from the first, like a respectable man, to business, and parted with it not till I could do so comfortably; he, from making clever caricatures of the ushers, had taken so to painting, poor fellow, as absolutely to choose it for a profession; living in the winter, so far as I could make out, nowhere; and during the summer months, under a little white umbrella. I had bought, for old acquaintance' sake, some early landscapes of his—of very great promise, I was told; and two or three later ones were just beginning to attract public notice, or I should never have persuaded Mrs Winkwerd to employ him at all; but, to my thinking, he lived a miserable life. He said, however, that he was twice as jolly as I was at all times, even at portrait-painting—a thing he hated, and only busied himself with when especially hard up; and that he did not doubt he should be one day as rich as Turner, and with all the world for his Ruskins. His face—so much of it at least as his hair, whiskers, and moustaches permitted of your seeing—was very fine; and he was accomplished and agreeable enough to please the Winkwerds, as an amusing sort of drawing-room artisan, immensely. He was suffered to do and say things that Frederic Biles, Esq., would have shrunk from in such company like a guilty thing; and, on his part, liked the rectory-folks so well, that, after taking Emily's likeness, he took that of the other sisters and their mother for love. He was employed upon the portrait of the Rev. Claude himself—with his hand upon a volume of sermons, surmounted by the *Peerage*—when a circumstance occurred, which, if I may use such a form of words, put poor Jack's nose out of joint, and settled his business for him very completely.

This was the arrival of no less a person than Ambrose Slasher, Esq., connected by family ties with the Winkwerds, and by red tape with the government then in power, being the paid *attaché* to Her Majesty's legation at Honolulu, and in a fair way to represent the empire there himself, when an opportunity should offer. He was not a wise man, he was not a good man, and he was not a rich man; but he was a sucking diplomatist likely enough in this glorious constitution of ours to become one of those three. The great mother Britannia is not wont to leave a scion of her Sleightvands to wither on L.600 a year, and Mrs Winkwerd knew it. Ambrose, although by no means 'so bald that you might see his brains,' was getting thin about the poll, grave in demeanour, slow of speech, pompous of aspect, and generally in accordance with his profession. I did not think he was at all a suitable husband for dear Emily, at first; and the more I saw of him the less I admired my respected mother-in-law's choice; but I am aware that a Biles can scarcely be a judge of such high matters. I have a portrait of him by Jack Camellair, which I would not part with for L.50, although I dare say Ambrose himself would give 5s. to have it burnt. If only knowledge puffeth up, I should like to know what ignorance has done to the *attaché*, to give him such a swollen appearance. He put down the Rev. Claude upon all occasions; he received all Mrs Winkwerd's servilities as his just dues, and was in no degree mollified or put in good-humour by them; he treated the young ladies with a sort of graceful scorn, and he was rude to Emily herself; yet all, except the last, seemed charmed with him. Jack's most perfect *mots* were now unheard in the applause that greeted the great man's heavy pleasantries; his raciest anecdotes were cast into the shade by some dull reminiscence of the diplomatist's foreign travel. I am afraid that Mr Thomas Moore's epitaph on a tuft-hunter applies more to women than to men:

Apollo for a star they quit, and Love's own brother for an earl's.

I was angry at the change of behaviour among the Winkwerds generally towards Jack, on Mr Slasher's arrival, but I was sincerely grieved at that of Emily. She was in a very short time engaged to be married to this gentleman, it was true—it was in order to be present at the wedding that I was an unwilling guest at the rectory at this time; but this was no reason why she should follow Ambrose's stupid lead in regard to the poor painter. My wonder was how he stood it at all, and I privately recommended him to depart and leave the Rev. Claude just as he was, without a complexion and with sketchy legs; but Jack said: 'No; when he had taken an order, he liked to execute it;' mimicking my best business manner, and quoting my favourite phrase. Emily had been once, I thought, the most pleased with him of all, but now she offered him the cold-shoulder—and a good deal of it, as her style of dress permitted her to do—upon all occasions. She never failed to give the poor fellow a set-down when the diplomatist chanced to be present, and laughed heartily at his describing some obscure street in Honolulu as the habitation of tailors and artists. As Camellair observed, indeed, in allusion to this delicacy, Mr Slasher was 'a deuce of a fellow among eggs with a stick,' which was a word-picture of the man as good as tongue could paint. Still there was no pretence of affection on the part of the bride-elect; she had been disposed of by private contract some five weeks ago, and was to be given away without reserve on the ensuing Friday to Cousin Ambrose: that was the agreement; and she had determined, apparently, to abide by it; only at times when the diplomatist's partook—it was but rarely—of a little too much of the *entente cordiale*, I observed her shiver, poor girl,

as though, if I may so express myself, a goose was walking over her grave. She had been brought up in the Winkwerd school, however, and had well learned its lessons long ago; that was what I comforted myself with until the Wednesday evening before her wedding-day—although, indeed, my wife was very miserable about the match; declaring that her sister was about to be sold into bondage, which she truly was, and to a mere government organ; but then, who was to put a stop to it? I had sauntered out after dinner with a cigar, glad enough to escape from the bustle of the house, where everything was being got in readiness for the guests of the next day, and was strolling through that part of the grounds which is called 'the Wilderness,' when I came suddenly upon my wife sitting upon a moss-bank bathed in tears.

'Now, my dear Carry,' said I, 'do give over this wailing over your poor little Emily. If the girl likes the fool, it is all a matter of taste, about which, you know, there is no disputing; if she doesn't like him, she should let him hang himself in his Honolulu ribbon before she should become Mrs Slasher. What must be, must be, and therefore I don't make myself wretched about it; although, for my part, I'd just as soon see her married to, to—I looked about for a sufficiently base comparison, and thought myself rather fortunate at last in saying—"to that unfortunate penniless vagabond, Jack Camellair."'

'Would you, indeed, dear Mr Frederic?' sobbed my little Emily—for it was the one without the name under her left ear I had been speaking to. 'O please, please, my good dear brother, to help us.' Poor passionate girl! The suffocating mask thrown off, and the weary part laid by for a little while, how different she looked from the Emily of an hour ago!—but infinitely wretched, and yet, to my mind, how far better through those tears! 'I don't like Mr Ambrose at all, for I am afraid of him,' she went on pathetically. 'I don't think he is very kindhearted; and, and, and my dear brother, for your own loving wife's sake, save me from this terrible man!'

'My eye and so and so,' said I, 'apologising to you at the same time, Miss Emily, for the vulgarity, but this is a precious pickle. What can the voice of Biles avail you, lifted up against the whole Winkwerd chorus and the Sleightvand echo in the distance? I am sure I will insult Mr Slasher in any way you please, or even have a turn-up with him at fisticuffs—having been in trade, of course pistols are out of the question—when and where he chooses; but as to opposing your respected mother and the rest of your noble family in conclave, I could not do it, even for your sweet sake. I durst not, and that's the truth. "What is Miss Emily's objection?" would be the very natural remark, and I am sure I should not know how to answer it. You appeared to be very much satisfied with him; and, indeed, he is as good as half-a-dozen others who— Well, my dear child, don't intend to be cruel and unkind, but since you don't love anybody else—'

'Ah, but I do, dear Mr Frederic,' she sobbed—'do: I do so very much love your friend, Mr Jack Camellair.'

'What!' said I, feeling scarcely less astonished and horror-struck than Mrs Winkwerd could have felt herself—'what! you daughter of a hundred kings, you pampered little pet of your family, are you prepared to lodge under a white umbrella, like the Great Mogul called Babo, to slave at mixing nasty colours to sit as a model in all kinds of ridiculous costumes to be hung up in exhibitions as "A Moorish Peasant Girl," "An Eastern Hour," or as "Passion: a Study?" Do you know what an exceedingly disreputable profession painting is? Are you aware—to use a stronger expression—what an excessively contemptible person Jack'—

'Yes, Fred, she knows all that, and more besides,' said the rich low voice of my handsome vagabond-friend. 'I have heard something of what you have said to my dear love, and I think there is much truth in it, and am sure you meant it well. My art is not, indeed, a very remunerative one; but even in that respect, I am better off than you imagine. If I have my health, I shall do very well as to money-matters, I don't doubt; at present, however, I confess I want a little help. I have two companion-pictures, "The Wooing," which you know, and the other, "The Winning," which has still some details to be worked in; you will lend me, Fred, I know, L.500 upon these two; that will suffice to last us in some quiet pretty place, less distant, if less fashionable, than Honolulu; and for interest, Emmy dear [think of this journeyman painter's having already cut it so short with this descendant of royalty as 'Emmy!'], pay the usurer beforehand with a kiss.' And as sure as I sit here and write it, my cigar was thereupon tenderly removed from the corner of my mouth, and the prettiest pair of lips (save one) in the world applied them in its place five times before I could even think of saying 'Don't' or 'For shame!' 'There, that'll do,' said Jack, rather impatiently, and with the air of a man who had conferred a favour: 'now, that's settled.'

Well, the name of Biles upon a check for L.500 was as good, and perhaps better, than that of any Slasher or Sleightvand of them all; and as I really felt for the poor girl, and hated the diplomatist, and knew Jack to be a thoroughly good fellow at heart, I gave them my autograph for the amount without more words, upon the condition that I should know nothing of their plans whatever, be they what they would; so that I might enjoy anything which might suddenly occur as much as anybody else, and afterwards be able to lay my hand upon my heart and deny everything; for I had that wholesome terror of Mrs Winkwerd, that I would as soon have been a party to a scheme of some Italian greyhound for carrying off the young of a princess, as to the abduction of the glory of the Winkwerds by Jack Camellair. Having thus washed my hands, then, of the whole concern, I finished my cigar, and sauntered back to where the attaché, over his third bottle, was patronising universal nature as perceived in her July glory through the open French windows of the dining-room. He was just the sort of man who, when he has got his wine, begins to compliment the general arrangements of Providence, and 'looking in a tumbler in a glass,' who 'smooths his chin, and strokes his hair, and says the earth is beautiful.' He regarded Emily herself in the light of an ornament fabricated for his pleasure, calculated to adorn the Honolulu embassy, and do credit to his magnificence. 'She has much to learn, has Emily, Mr Biles,' he was good enough to confide in me that very evening; 'but she is pliant, and will become our position, we do not doubt.'

'Your excellency'—said I.

'Not yet, sir,' he interrupted, with one of his most gracious inclinations.

'Your excellency'—I went on all the same—'is a great master, and the pupil is apt.'

The silly fat state-functionary liked meaningless propensities of that kind beyond measure, as I knew, and was set bowing like a mandarin for several minutes.

On the next day, most of the wedding-company arrived: Lady Toppingtower, the married sister, who bore a sort of painful resemblance to Emily herself—she brought a half-starved-looking French maid with her, of whom she seemed to stand, nevertheless, in no little awe, and did not present a favourable example in any way of the bliss of high alliances: the Lord Sleightvand, a plump, jovial old nobleman, who

seemed to have met with nothing up that long life-journey of his but carriages full of other jovial noblemen, and amusing beggars by the roadside, who stood on their heads for pennies, and were thankful for them: the Hon. and Rev. Swete Smilar, his brother, a gentleman of the most urbane grace, who had come express from Windsor to perform the mystic ceremony between his beloved cousin Emily, and his most respected and talented connection, Her Majesty's attaché—these two with a costly gift and a stilted phrase apiece for the young bride; and another Swete Smilar from his crack regiment at Gibraltar, with a Mediterranean jewel for her waist, and a kiss for his cousin's brow, which he claimed and imprinted to the astonishment of the groom-elect, before us all. There were no fewer than five aunts—two of the Winkwerd, and three of the Trevor family, one of the latter of whom I was given to understand was made of money. She was made of a good number of other things besides, however; and Jack Camellair expressed to me a private wish to take two sketches of her, to be entitled 'Before,' and 'After,' which he reckoned would become popular: the one with her false eyebrows, hair, teeth, colour, and figure on; and the other without these accessories. There were also eight bridesmaids, selected exclusively from the families of the landed gentry; and the rectory was full.

The Rev. Claude, I will do him the justice to say, was, with the exception of my dear Carry, the only person who did not seem thoroughly satisfied with the pending event: he was perpetually expressing his delight about it, and asking the opinion of everybody upon the subject, which he intended should be given only in one way. He came down from his pedestal so great a number of steps even, as to demand mine. 'Don't you think, sir, that Mr Ambrose gives one quite the idea of one of England's diplomatists?' To which I assented fervently. He went about the house shaking hands with all sorts of people he did not care for, in a nervous fill-up-the-time sort of manner, and kissing his poor Emily perpetually, as though she were about to take some doubtful or hazardous step. Whenever this happened, all her stateliness melted away at once, and she rested on her dear father's bosom like a rose-bud touched with the dew. Once, I am perfectly certain, she was about to tell him something, and make a regular scene, only she caught two pair of eyes fixed upon her at that very moment—Mr Ambrose Slasher's, saying rather languidly, but with quite sufficient malice, nevertheless: 'What! you're sorry to go away from home, are you, and afraid to trust yourself to my tender mercies, young woman?' and Jack's, appealing to her with the expression of his own 'Tullus Aufidius,' in last year's Exhibition, where he is evidently remonstrating with Coriolanus, besought by his mother: 'Now you won't go, surely, in a moment of filial indiscretion, and wreck all our little plans.'

What Jack's plans were, as I have said, I knew nothing about; but my fears for their discovery made the day pass wearily enough. I should have thought, if it had not been for a certain tender gratefulness in Emily's 'Good-night' that evening, that all hope of out-manoeuvring the attaché had died away. That great man sat up half the night in the library with an enormous desk, transacting the fag-ends of his bachelor-business—burning love-letters, and destroying locks of hair, as he would have had us believe, and did not retire till about one o'clock. I heard his stately step ascend the stairs with official regularity; and presently—for he slept in the adjoining chamber—the deep bass notes proclaim that one of Britannia's guardians was relaxing his perpetual vigilance. I strove to keep awake to catch more interesting sounds which might betoken that his rest was being taken every advantage of. I thought I heard a fairy tread upon

the landing outside, then two soft voices whispering, and the French window beneath slide open, as though under the influence of salad oil; but it may have been, as I told Carry, who heard it also, nothing but the cats. 'There's somebody getting into the house,' said she; but I gave her my word of honour that there was certainly nothing of that kind, but quite the reverse.

Early in the morning she got up, tearful, to go to her sister's room. She came back, as I expected, almost immediately, white and trembling. 'Frederic, Frederic, what do you think has happened? Mr Camellair and Emily have run away!' I was pretending to be fast asleep just then, but I could not help blurring out: 'Well, I'm very glad to hear it;' then recollecting myself, and before she had time to attack me: 'Very glad that Emily has got a fine day; what did you say about Mr Camellair?' but I'm half afraid my wife suspected me.

What an awful row there was in a few minutes! I heard Mr Slasher pulling on his patent-leather boots with the most undiplomatic expressions; I heard a tumult of sobs from the bridesmaids' chambers, who were sleeping four in a room, and I saw them like a Greek chorus, at their doors, in white; I caught a glimpse of Aunt Belinda Trevor, sans teeth, and almost sans everything, as she stood at her threshold, anathematising the fugitives, and announcing her intention of erasing Emily from her will; I heard the man in the crack regiment laughing out of the next window but three, until exhausted, and afterwards he began again; I heard my own name uttered vehemently by my respected mother-in-law, and I locked my door and retreated into my bed at once. 'Mr Biles, do you know anything about this? Mr Biles! Mr Biles!' and at that inoffensive monosyllable, the whole household seemed to rally around my door. 'When did they go? How did they get away? Where have they run to? Where's the key of the stable, Mr Biles?' (Clever Jack, to hide the key of the stable!) 'I don't know,' was my answer to everything that was asked of me, until I lost my patience, when I varied my reply by adding, 'and I don't care.'

Catching the young couple was luckily out of the question, for they had taken the only four horses—the horses that were provided for the *other* husband—five hours ago with them, and it was only thirty miles to the Scotch border.

I told Slasher it was of no use his getting into a passion with me, and he contented himself at last with abusing all painters, and Jack in particular. 'I saw rogue in his eyes when I first looked at him,' said he; but, as Camellair remarked when he heard of this: 'Perhaps it was only the reflection.'

The magnifico, indeed, although very savage, was not the sort of man to die of a broken heart; the three remaining Winkwerd girls, indeed, set to work so vigorously to comfort him, that, in course of years, Blanche, the plainest, married and kept him in the family after all. Until that happened, the name of Camellair was forbidden to be breathed at the rectory, but there was soon afterwards a great reconciliation. I had got my L.500 back long before then—the 'Winning' alone, when finished, fetched the whole of the money—and Jack had found himself famous. To the original of his celebrated picture of 'The First Born,' which hangs in half the drawing-rooms of Mayfair, I had the pleasure of being godfather; and I brought the first 'proof before letters' down to the Rev. Claude with my own hands. 'Why doesn't he come and finish my picture?' said the old gentleman, with the tears standing in his eyes at the sight of his grandson. Jack came down, like a good fellow, with his little family to the rectory at once. My respected mother-in-law set her—if she will pardon the expression—set her back up at him at first most uncommonly; but lately,

since he has become an R.A., and is likely to be knighted, she has not been able to resist his delightful manners. He has given me the go-by in her good graces very easily, and she calls him 'John,' whereas during the whole of my long connection with the honourable self, I have never passed the limit of 'B.' Jack makes as much at home as his excellency himself—who is his excellency now—enjoys Honolulu; and besides that, he has the satisfaction of working for it.

SALMON AND THE SALMON-TRADE

OUR recent observations on the science of pisciculture shewed that, by artificial aid, we could so assist the operations of nature, as greatly to multiply our stock of fish; more particularly those belonging to the salmon family. The article Pisciculture traced the fish from the egg or spawn till it was a few months old, leaving it in its reception-pond as salmon-fry—a tiny fish, not more than an inch and a half in length. Even while in this state, the infant salmon has attracted great attention, and from its youth up has afforded much scope for the learned speculations of our naturalists as any other branch of natural history. There has been no end of controversy about the genus *Salmo* and from its birth, to the time when it finds its place on the table, in the shape, perhaps, of *côtelettes de saumon à l'Indienne*, it has been the subject of innumerable wars—on paper—most of them carried on in the pages of the transactions of learned societies, and therefore accessible to the general public.

The most important of the many controversies which have arisen in connection with the natural history of the salmon, is undoubtedly that relating to the parr, which some persons scarcely allow to be settled as the young of that fish, notwithstanding evidence that has been brought before them in the course of the controversy. The question at issue is primarily, whether the plentiful little fish, known in Scotland as the parr, and in England as the smolt, was really the young of the salmon, and became in the course of time first a smolt, then a grilse, and change of all, assuming the noble shape of the grown fish; and second, at what time the change from the parr to the smolt took place. As we have already hinted, the amount of controversy on the subject has been great, some writers contending that the parr is a distinct fish, totally unconnected with the salmon, living and dying, in fact, without changing its condition; while others asserted, and, as time tells us, more truth, that it became in the course of nature a smolt, and then changed in due time to the delicate fish so prized by epicures for the table, and so valued by men of commercial tastes for its capability of being changed into gold. Considering the parr question being effectually settled by the experiments at Montfield, we propose in the present paper to add ourselves to a consideration of an equally important branch of the salmon question—supply and demand.

In recent papers, we indicated the vast food-recess which the skill of man might gather from the sea. The fecundity of fish in general is something so monstrous as to be truly wonderful, and seems to offer a continuous and almost boundless supply. This was at once apparent, when we state that a single cod has been estimated to contain 9,384,000 eggs, and a flounder weighing twenty-four ounces has contained

nearly a million and a half; whilst the herring, the mackerel, and other fishes are known to be equally prolific. The salmon is a most productive fish, the roe varying between 1500 and 5000. When we take into account this enormous power of replenishment peculiar to the fish-world, it is not easy to realise the fact of constantly decreasing supplies of salmon, a fish so carefully watched, and so much protected by legislation; but a little inquiry into the matter affords a ready solution of the apparent mystery. We will enumerate some of the drawbacks which have led to the yearly decline in the supply of this valuable commodity.

One of the greatest causes of scarcity is the few fish which are now allowed to arrive at maturity. When the eggs are deposited naturally, Sir Humphry Davy calculates that only about 800 out of every 17,000 of them arrive at the phase of marketable salmon. Our readers are already familiar with the enemies of the spawn, and the dangers to which it is exposed, when left unguarded at the mercy of its various enemies. The dangers awaiting the advent of the young fish into the river, when they are pond-bred, are no less destructive. The moment they escape from their nursery at Stormontfield, their sorrows begin, and they are certainly as numerous, if not so traditional, as those of the young bear. In the parr state, they are esteemed a dainty morsel by various other fishes, such as the yellow trout, the pike, eel, &c.; and even their own mothers and fathers—awful cannibals that they are!—swallow them by the dozen. In reference to the voracity of that fresh-water shark, the pike, Mr. Buist, the superintendent of the Tay fisheries, states the following facts. Some gentlemen having sent a trout-net manufactured for Highland loch-fishing, asked leave to test its powers on one of the Tay fishing-stations. 'The trial was made about the middle of May, at a place in the Tay near to where the Almond joins it. At the first sweep, they hauled there sixty-seven pikes, and in killing them, they secured several vomiting salmon-fry. This raised the curiosity of those who were engaged in fishing, and the persons to whom the pikes were given were desired to examine their stomachs. This was done, and every one was found to have less or more of salmon-fry in different stages of digestion; many of them had five fry. If such destruction as this occurred at one place, what must it be in the whole of the Tay and its tributaries?' One great use of the breeding-stations will be the protection afforded to these parrs. They are not set at liberty till they have reached the parr state, and are therefore better able to protect themselves; but even as smolts they cannot escape the numerous 'dangers of the deep' incidental to the life of all kinds of fish, which are notorious for preying on each other, and few of which ever reach the 'scar and yellow leaf' of old age. If the sea-going smolts escape the numerous dangers which await them in the river, they are menaced, on entering salt water, by a horde of enemies. Crowds of different kinds of fish of the *gadida* family are lying in wait for them. That this is a trying ordeal for the shoal of beautiful young smolts, may be estimated from the fact that as many as seven or eight have been taken from the stomach of a single coal-fish. The dolphin, the sunfish, the porpoise, the cod-fish, and many others, are particularly fond of smolts. Otters, too, are remarkable for their penchant for all kinds of fish, and are particularly fond of the choicest cut of a young salmon or a tender grilse; indeed, the fish after being seized by this animal, is frequently found left

at the side of the river, with only a bite or two taken out of the shoulder, and the rest quite good for food. Both the sethe (coal-fish) and the syth are found in shoals watching for the smolts, and numerous others of the great monsters of the deep lie in wait for the young of the salmon—their unerring instinct teaching them when these fish will appear. The perils of the salmon, from the day the egg is deposited, till the period when the fish reaches the fishmonger's counter, are so numerous as to prevent more than this allusion to them at present.

Another of the many causes which tend to decrease the supply, is thus stated by Mr. Daniel Ellis, in a *résumé* of the House of Commons' Report, which was published some years ago in the *Edinburgh New Philosophical Journal*. 'The evidence in this Report,' he says, 'goes to prove that the productiveness of the salmon-fish has decreased, and is decreasing, in almost all the rivers in the United Kingdom; but this decrease arises, not so much from the changes in the habits of the fish, or in the condition and circumstances of our rivers, as from the operation of injudicious laws in relation both to the times and modes of fishing; from the prevalence of most destructive practices and incredible abuses in almost all our rivers; and from the indulgence of a too greedy spirit of gain, which, instead of waiting for the natural production of the golden egg, cuts up at once the animal that can produce it.'

One of the 'destructive practices' above alluded to, is certainly a deadly drain upon the productive powers of the fish. We allude to the system of poaching, which is so extensively carried on during 'close time.' Few of our readers can have any idea of the immense numbers of salmon which are destroyed by this cause, and at the very time when they are at their greatest value, intent on the propagation of their kind; indeed, on the very spawning-bed itself, the 'deadly leister' is hurled, with unerring aim and mighty force; and the slain fish, safely hidden in the poacher's bag, is carried off to be sold and kippered for the English market. A party will start at nightfall, and dividing into two companies, sweep the Tweed with a net from shore to shore, and capture everything of the salmon kind that comes within reach. A person comes at a time arranged, and carries away the spoil, which he pays for at the rate of threepence per pound-weight. The takes, upon such occasions, average from ten to forty fish. The first night upon which our informant—a weaver—went out, the result was seventeen large fish—three of which weighed ninety pounds. Upon the second occasion, the take was much larger—thirty-eight salmon of a smaller size being the reward of their iniquity; weighing, in the aggregate, 640 pounds, and producing in cash L.8 sterling, divided among eleven people. Single fish are frequently killed on the spawning-bed; the male salmon being preferred, as its flesh is not in so bad a condition as that of the female. Sometimes both male and female are transixed at a single stroke!

The farm-servants at the farm-steadings near the river frequently indulge in the same 'sport'—sport which Mr. Younger of St Boswells pithily describes as being 'desperate, daring, devilish, and cruel.' The farmer, having no interest in protecting the fish, and sometimes not objecting to a share of the spoil, allows the matter to take its regular course. The necessary lights are furnished out of the resinous roots of the pine-tree. These provided, a band of men, numbering twenty or thirty individuals, are collected; and disguised in ragged clothes, and with blackened faces or masks, they proceed to the 'reds,' or spawning-beds, and lighting their torches, begin their unholy work, undeterred by the water-bailiffs, some of whom, collected on an adjoining height, may perhaps be viewing the picturesque scene, afraid to interfere.

We may just cite one other cause which must certainly affect the health of the fish, both in their infantile condition and in their more mature state—that is, the rapidly changing condition of our salmon-rivers. It must be borne in mind, that since the time of the sitting of the House of Commons' committee, a perceptible change must have taken place in many of our streams in consequence of the erection of mills, manufactories, &c., which discharge all the used water, frequently poisoned with dye-stuffs, &c., into the very channels frequented by the breeding-fish. It is no doubt essential that manufactories should be erected within easy reach of water-power; but is it necessary that the used water should be again turned into the stream from whence it was drawn pure, poisoned with mineral or vegetable colours? Could it not be collected and used up as liquid-manure? Are there no chemical processes which would render it of value, or which might, at any rate, neutralise its baneful effects on fish? We noted, in the evidence given before a committee of the House of Commons, as to a recent water-bill for Edinburgh, that one of the gentlemen connected with some kind of manufactory on the banks of the Water of Leith, stated that he had never seen a living fish within a mile or two of the place. A writer in an agricultural work says, that 'draining the land on the banks of rivers is said to have injured them as fishing-rivers, by destroying their equability; that is, before the draining, the rain that fell upon the land found its way to the rivers with difficulty, and so kept the streams equable for long; now it finds its way to the rivers at once, and consequently causes a heavy flow all at once, but that over, leaves the river habitually low.' The disappearance of salmon from the Mersey is stated to be in consequence of the river Irwell bringing down to it all the filth of Manchester; and the disappearance of the fish from some of the rivers of Norway is supposed to result from the immense quantity of timber-dust sent into the water from the various mills.

One other regulating element in the supply of salmon is the fact, that the parrs are not afforded the same protection as we accord to the smolt. Hundreds of them are killed by juvenile anglers without the slightest remorse. A smart little fellow, spending his vacation on the banks of the Isla, writes home in triumph to his father that he and grandpapa had caught 390 'parries' in a day. Think of that! Why, if only the odd 90 fish had been allowed to arrive at maturity, they might, in the course of nature, have added a large sum to the national wealth of the country. We know a respectable widow, living on the banks of a salmon-river, who fed her pigs on the parrs caught by her children. The Ettrick Shepherd waxes eloquent on the destruction of these infant salmon, and calls this spoliation 'a loss and a grievance of dreadful enormity.' In another part of an article on the subject, he says: 'Let the proprietors of rivers only think of the millions of these precious fry with which every Cockney angler's basket in the United Kingdom is stuffed, and without which that species of fishermen would get no sport.' The Shepherd estimates the destruction by each angler at about twenty dozen a day, or 40,000 per annum. 'It is worthily of legislative interference,' says Mr Hogg, and we quite agree with him. Smolts are protected with the utmost rigour of the law. Only a few weeks ago, a respectable tea-dealer from Edinburgh, angling in the Tweed, had the misfortune to capture a few—ten, we think, was the number—when, lo! he was pounced upon, and soon found out his error, by having to pay a fine, and expenses amounting to L.5, besides bringing an advocate from Edinburgh to defend him in a local court. Why protect the smolts and neglect the parr, now that it is known to all to be the young of the salmon?

Twopence per pound-weight used to be at one time

the usual retail-price of salmon in Scotland. That was before Mr G. Dempster of Dunnichen had discovered the art of packing it in ice, or the steam-boat railway-engine had been invented to whirl it off to London, Manchester, or Liverpool, or the still more distant continental markets to which Mr Saunders Billinggate informs us it is now sent in its fresh state. This discovery of Mr Dempster may be said to have been the means of commencing the Scotch and Irish salmon-trade, which has proved so great a source of wealth to the proprietors, as the price soon began to rise when London came into competition with local markets. This discovery has undoubtedly been an inducement to that overfishing which has been tending in later years to reduce the supplies. The great desire to obtain profit from the fishings, has led to a much greater anxiety to kill fish than to breed them. It is quite certain that we shall never again hear of salmon being sold at twopence per pound. In these days, a good fish, in one of the fashionable west-end fish-shops in the early London season, is worth as much as a prime sheep. A person having access to a file of the *Times* will be able to trace the gradual increase in the price of salmon in late years, during which it has progressed from season to season, till it has reached the present rate of 2s., 3s., and sometimes even 5s. per pound-weight in London. And even in provincial towns much nearer the sources of supply, 2s. a pound can be readily obtained for the best parts. The old proverb of one being dearer at Newcastle than anywhere else can be illustrated in the salmon-trade, as we have seen from experience that the fish is fully 10 per cent. dearer on the banks of the Tay, where it is caught, than in Edinburgh.

There can be no doubt of the great value of salmon as an article of commerce. Princely revenues were at one time derived from the rivers in which the fish was wont to abound. Even yet, with a supply which is yearly diminishing, the money derived from salmon-fisheries must form a considerable item in the rent-rolls. We may instance the case of Lord Glenelg who has drawn from the Tay a sum amounting to more than L.100,000 during the last thirty-five years. The salmon and grilse supplied for this sum run from 10,000 to 28,000 a year. As shewing what a small lottery salmon-fisheries are, we may state that, in 1811, when 10,000 fish were taken, the rental of the station alluded to was L.4000; and that in 1842, when the capture was 28,453 fish, the rental was L.1000 less. Indeed, we have some cause for wonder in the matter of fishery rentals, seeing that various economists who have written on the subject, say that for several years past the fisheries have been an annual loss to the lessees. If we calculate the income for the last years specified above, we have the following result. Averaging the fish at 6s. each, gives us a total sum of L.2500 for the 10,000 year, shewing a loss of L.1500 while on the other year there is a profit of upwards of L.4000. The average number of fish captured on the fishery of Kinfauns for ten years, about the end of the last century, was—salmon, 8720; grilse, 1714. That was before the existence of stake-nets. In the first twenty years of the present century, the average catch of salmon fell to 4666, and the grilse numbered 1666. After the stake-nets were removed, and in the next twenty years from 1815 to 1824, the number of salmon caught was 9010, while the grilse amounted to 8700. This is illustrative of the value of the Tay fisheries, and may be mentioned that the stations from Perth to Newburgh, ten in number, have produced the following income for the years named—namely, in 1851, L.7810; in 1852, L.6098; in 1853, L.6962; in 1854, L.7762; in 1855, L.8417; and it may be stated generally, that although the rents drawn from some of the fisheries are less than before, the average shows an increase.

The difference on particular rents is, however, striking: thus, Lord Gray's, at one time as high as L.4000, was let in 1855 at little more than L.2000; whilst at a different station, which was at one period let for L.91 per annum, now brings in an annual revenue of L.500.

The commercial fisheries on the Tweed, which are those of the lower part of the river, have been for some years past very unproductive, excepting the season of 1854. We need not extend our figures further back than from 1821 to 1825, when the average produce of salmon and grilse was, in round numbers, 100,000 per annum. Ten years after the latter year, the number caught was 22,642 salmon, and 87,707 grilse. In 1845, after a lapse of other ten years, the figures are 8962 salmon, and nearly 70,000 grilse; but in 1855 the take was much smaller, the numbers being about 6000 salmon, and only 15,000 grilse. The seasons of 1816 and 1842 are remarkable for the large takes of grilse both in this river and in the Tay, and it would be curious to ascertain from practical men the reasons for this—many of them, it is said, can foretell very good or very bad seasons. In 1842, the take of grilse on the Tweed was close on 110,000, which was certainly an immense number. But their destruction in such wholesale quantities is perfect madness; they should be allowed to continue their species before being killed. The two or three shillings derived from each of these grilse would in a year or two have been as many pounds. No wonder the salmon gets every year more and more a rarity, when so many of the young fish are slaughtered in the grilse state. So far as the parent fish is concerned, Lord Gray's fishings alone (on the Tay) seem equal to the whole of the commercial fishings on the Tweed. The rental of this river was at one period as high as L.20,000; it has been successively L.12,000 and L.10,000, but now it is less than L.5000; and fishing-stations which used to yield fish in tens of thousands, are now reduced to hundreds. At one station on the Tweed, where 17,000 fish have been taken, only a few hundreds can be caught. We may state, however, that a great number of salmon are taken before they can get into the river—because at stations five miles on either side of Tweedmouth, large numbers are fished, equalling perhaps half of the quantity taken by the river fishermen. An intelligent writer on the subject of the Tweed-fisheries says, in August last year: 'The tendency is still downwards, especially with grilse; and I regret to say that, so far as this season has gone, salmon are not more than one-third of what they were last year—grilse are considerably short of what they were last year, although it was the worst upon record.'

It is difficult to obtain reliable statistics on the salmon-produce of our rivers in Scotland, there is so much jealousy on the subject between rival tacksmen, that this we have ascertained to be true, as was stated by witnesses before one of the committees of the House of Commons, 'that the skill and perseverance of the fishers are now so great, that, under the stimulus which ready markets and high prices afford, very few of the clean salmon which once pass up our rivers, are again permitted to return to the sea.'

The English salmon-fisheries are now so much decayed as to be unworthy of consideration as a source of national wealth. Although the Thames formerly produced a number of fine fish, we believe the capture of a single salmon in that river is an event of special rarity. Fish are still taken in the Severn and some of the other rivers of England, but not to any great extent. London and the English markets generally are therefore almost entirely indebted to Scotland and Ireland for their abundant supplies of this delicacy, which, by means of ice-packing and steam-carriage, is placed on the dining-tables of London and Paris in a state of freshness which ought to satisfy the most fastidious appetite.

'Justice to Ireland' demands that we should devote a portion of our space to a notice of the Irish salmon-fisheries, which are of great antiquity, and which were, up to the year 1842, remarkably productive. And although they have fallen off in their supplies since that period, a vast quantity of salmon is still derived from the rivers of green Erin. In Ireland, as in Scotland, there was at one time a perfect glut in the salmon-market. Antiquaries mention that the fishermen of Lough Neagh and the Bann complained more frequently of the bursting of their nets through the overgreat take of fish, than of any want. Indeed, salmon, Evelyn says, was so plentiful in the Irish rivers, as to be hunted and dived for by dogs. In these early days, most of the fish, as was the case in Scotland, must have been salted; and we know that in that state large parcels of it were sent to England, and still larger supplies to the Catholic countries of the continent, where it was profusely used on fast-days. The trade, upon the discovery of steam, and such modes of packing as admitted of its being sent in a fresh state to the English and other markets, received a new stimulus, and the fishers obtained better prices than when it was sold in its pickled or dried state. Salmon can be easily and expeditiously carried from Ireland to Liverpool, and the value of the fish, as retailed in its fresh state, is at present about four times that of the best mutton.

The Irish salmon-fisheries seem in former days to have been even more productive than those of Scotland, and as they are more numerous and much larger, the annual quantity of fish was measured by hundreds of tons. It has been stated in evidence by Sir Richard de Burgo that, in his opinion, by means of proper development, the salmon-fisheries of the former country would speedily attain a yearly value of two millions sterling, instead of nearly L.300,000, which was about their value in 1847. We have no statistics since those of last year as to the Irish fisheries, but it is quite certain that there is a great falling off in the supplies, just as in Scotland, and no doubt from the same causes. 'So plentiful were salmon at one time in the Bann, that, according to Mr Finlay, 1400 have been caught at a single haul, and 1000 at a succeeding one.' Mr Worthington says: 'The average take of salmon annually at the chief salmon-rivers at that period (1842), may be taken at about 200 tons each; the Foyle fishery, in 1842, produced nearly 300 tons. Shortly anterior to 1842, in one town on the Shannon (Glin), L.8000 worth of salmon was sold in one season. The great fishery of the Moy, at Ballina; the Blackwater at Lismore; and last, not least, the Erne at Ballyshannon, produced also their hundreds of tons.'

We do not propose to enter into the question of salmon legislation, or to discuss the varied modes of capture, which have frequently formed matter of controversy; we may just allude, however, to one other matter connected with the salmon question, and that is, the diversity of interests occasioned by the numerous proprietary of such of our great rivers as contain this fish. There have been many proposals and suggestions made on the subject, and we cannot help feeling that the fishing interests are too numerous for the safety of the fish and the increase of the supply. When each man who leases a fishing is intent on spoliating his own division of the river, making, as a matter of trade, the most of his particular interest, the general interest must suffer in the long-run. Could the whole proprietors of a particular river not form themselves into a joint-stock company for the purpose of breeding and fishing for the general interest? This would be better than spoliating at particular stations, at the risk of impoverishing others. The upper portions of the river could be appropriated to breeding-ground, and the fishing could be managed at one or two particular

stations. In connection with this, a great extension of the artificial hatching system might take place, and so the salmon would increase and multiply, and become a property of greater value than it ever was before.

STANZAS.

STILL the same, ever the same, this outward face of things!

Time but toucheth it gently; little the change it brings.

Here where we sat together spreadeth the self-same tree—

Curved and matted the branches, just as they used to be.

Even the rich-toned lichen keepeth its place and form,

Mellowing the old gray oak-bark, tinting it sunset-warm.

Grandly the dome of beech-trees archeth the old wood o'er;

Vividly fretteth the sorrel the deep brown beech-leaf floor.

Even the delicate flowers cling to the self-same spot;

Meadow-sweet decks the river, and blue forget-me-not;

Close to the feathery larch-tree the woodbine clingeth still,

The wild-rose scents the valley, the golden gorse, the hill.

Cruel, O cruel Nature! put away the treacherous veil!

Put away the smile of mockery—tell us a truer tale!

Shatter the painful image of thy changeless trees and stones!

Thou art a whited sepulchre all full of mould'ring bones!

Green is the grass above our graves; dearer the death below;

No wood-songs bring our music back—it ceased too long ago;

Why should thy soulless beauty, then, thus everlasting seem,

The while our living flowers fade, and vanish like a dream?

Thus spake I, standing lonely in the old unchanging scene,

Marking the empty setting where the living gems had been;

But the solemn voice of Nature rose on the wind and said:

'Why wilt thou still be seeking the living amid the dead?

The seed and the berry moulder, and the hard stone mouldreth not;

But where rise the beauteous flowers?—where the seed and the berry rot.'

J. M. H.

LOW VALUE OF LIFE IN CHINA.

While so many elements of vitality are in a state of activity for the reproduction and sustenance of the human race, there is probably no part of the world in which the harvests of mortality are more sweeping and destructive than in China, producing voids which require no ordinary appliances to fill up. Multitudes perish absolutely from want of the means of existence—inundations destroy towns and villages and all their inhabitants; it would not be easy to calculate the loss of life by the typhoons or hurricanes which visit the coasts of China, in which boats and junks are sometimes sacrificed by hundreds and by thousands. The late civil wars in China must have led to the loss of millions of lives. The sacrifices of human beings by executions alone, are frightful. At the moment in which I write, it is believed that from 400 to 500 victims fall daily by the hands of the headsman in the province of Kwang-tung alone. Reverence for life there is none, as life exists in

superfluous abundance. A dead body is an object of little concern, that it is sometimes not thought worth while to remove it from the spot where it putrefies on the surface of the earth. Often have I seen a corpse under the table of gamblers—often have I trod over a putrid body at the threshold of a door. In many parts of China there are towers of brick or stone, where toothless—principally female—children are thrown by their parents into a hole made in the side of the wall. There are various opinions as to the extent of infanticide in China, but that it is a common practice in many provinces admits of no doubt. . . . Father Ripa mentions, that of abandoned children, the Jesuits baptised in Peking alone not less than three thousand yearly. I have seen ponds which are the habitual receptacle of female infants, whose bodies lie floating about on their surface.—*Sir John Bowring.*

COAL-OIL.

The production of oil from coal is not a new discovery, but the discovery of coal-beds in this country of character to yield a sufficient amount of oil to pay the expense of extraction, has but recently been made. In Scotland, the Boghead coal has for several years been used solely for distillation, being far too valuable for fuel. The oil from this coal is used upon the English and French railways, and the demand is always in excess of the supply. Railway managers prefer it to the best sperm oil. In Nova Scotia, there is another deposit of coal, the Prince Albert Mine, which also yields a good quality of oil; and these, with the exception of the Breckinridge, are the only localities yet known where the coal yields a sufficient quantity of oil to pay the expense of manufacturing. Since the experiments of the Breckinridge company were made with such a successful result, the whole country has been explored for oil-bearing coals, but thus far the experiments have resulted in disappointment. No coal has been yet found which could be made to yield more than one-half the results of the Breckinridge. It is of course could not come into competition with it. While experiments with this coal had fully satisfied the party engaged in them of its great value as an oil-producer, the company was at once formed, under the management of the Messrs Cairns, who made a contract for a series of years with the Breckinridge Coal-company for a supply of their coal, and commenced putting up works for manufacturing oil at Cloverport, Kentucky—the shipping point on the Ohio River of the Coal-company. When the whole plant has been set up, the product of the company will be 15,000 gallons crude, or 13,000 gallons refined oil, per week. This would give 780,000 gallons per annum.—*New York Tribune.*

NEW DECIMAL MONETARY SYSTEM.

This system (from the *Argus* Australian paper), based on the 5s. or crown-piece, has the merit of not disturbing the value of the existing paper, gold, or silver currency.

Paper, L.5,	= 20 crowns,	= 2000
Gold—		
Sovereign, L.1,	= 4 " ,	= 400
Half-sovereign, 10s.,	= 2 " ,	= 200
Crown,	= 1 " ,	= 100
Silver—		
Five-shilling piece,	= 1 " ,	= 100
Half-crown,	= 50	
Florin,	= 40	
Shilling,	= 20	
Sixpenny-piece,	= 10	
Threepenny-piece,	= 5	

The author of the above proposes a new paper of L.2, 10s.—10 crowns, 1000 cents—and L.1, 50 crowns, 500 cents; but the less appearance of money there is at first, the better chance the decimal system have.

Printed and Published by W. and R. Chambers, 21, No. 1, Foster Row, LONDON, and 239 High Street, Glasgow, and sold by JAMES FRASER, 14 D'Olier Street, New York, Bookellers.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 175.

SATURDAY, MAY 9, 1857.

PRICE 1½d.

OUR FRIEND THE GOVERNOR.

We were bound for Madras direct, with liberty to call at the Cape. Madeira, with its balm-breathing atmosphere and sunny clime, had long since been left astern. The warm sunshine, genial breezes, clear skies, and deep-blue waters of the tropics, wherein our gallant craft was wont to 'steal silently on her course,' were to us but as pleasant memories of the past, the more to be regretted from the chilly reception we experienced from the keen and cutting blasts that too soon proclaimed the inhospitality of those dreary regions of the far south, whither we were slowly progressing. The change was anything but agreeable, especially when we found ourselves driven a long way out of our course by a succession of south-easterly winds. However, at this juncture, when every one on board was in despair from the tedium and monotony of a passage that was becoming absolutely insupportable, the old adage of 'it's an ill wind that blows nobody good' was verified, in a way that was both agreeable to ourselves, as well as beneficial to the worthy individual whose strange history forms the subject of the present paper. How this was brought about was briefly as follows:

As was then frequently the case, we were one afternoon beating under double-reefed topsails against a strong south-easterly gale. A heavy sea was running. Dark masses of portentous-looking clouds swept rapidly across the sky, apparently pausing in their aerial flight for the purpose of warning us of the coming gale, of which they were the precursors. Still the old craft staggered on, and rolled and pitched, and lurched through the seething waters, in defiance of the storm, which momentarily increased in force, and the waves in size. It was a cheerless scene; we saw the officer of the watch, who paced the poop in gloomy meditation, and a few old salts who varied their pleasant occupation of knotting yarns under the lee of the weather-bulwarks, by skillfully dodging the white cataracts that occasionally invaded their retreat, whose soul was visible on deck.

Between decks, everything was equally uninviting, and not the least, the close stifling atmosphere inescapable from closed ports and hatches. Round the stowage-lanterns, whose oscillating rays revealed the long and dreary perspective of the bulkheads, which, at every roll and lurch, creaked and groaned a melancholy discord to the shrill but unceasing trouble of the gear aloft, were grouped a few of our adventurous of the passengers, who, weary of the confinement of their cabins, determined to show themselves on deck, and brave the fury of the elements.

Thither also the present writer repaired, and in their congenial society awaited the arrival of his respected commander, with whom, as midshipman of the watch, he had the honour of an invitation to dine that afternoon. Seven bells were struck: as the last sound floated away to leeward, the portly form of the captain emerged from the hatchway, and the hitherto almost deserted decks suddenly assumed a most animated appearance. Crowds of cuddy servants, headed by their chief, the steward, hurried to and fro, laden with the good things our gallant host had provided; the prospect of enjoying them being enhanced by our hearing him give the order to the officer of the watch to 'let her fall off four points, and round in the weather-braces.' During the execution of this most welcome command, we entered the dining-cabin, which, to our gratification, was graced by the presence of some of the fairer portion of our fellow-voyagers, whose appearance was to be attributed to the late desirable change. At the conclusion of the banquet, and after the usual toast of 'absent friends' had been done justice to, Captain Soanso begged to propose as the next one, 'Our friend the governor.' This was also duly responded to by some, under the impression that it referred to their mutual friend at Madras, and by others in happy unconsciousness as to whom the honour was intended for.

'That you may not be under an erroneous impression,' said the captain, 'I must inform you that the social position of my governor is neither so high, nor his seat of government so distant as the personage you imagine.'

'Who is he then?' inquired Major-general Mango, leisurely sipping his glass of port. 'I thought you intended the compliment for my friend Sir Harry.'

'By no means, general,' replied the commander; 'I have not the honour of so distinguished an acquaintance. But to satisfy your curiosity, I may as well tell you that we are now steering a direct course for my old friend's seat of government, which is about 150 miles distant; and if the wind stands, I hope, in the course of to-morrow morning, to have the pleasure of introducing you all to Corporal Glass, the governor of the island of Tristan d'Acunha.'

'Dear me, how delightful!' exclaimed several of the ladies, excited at the bare prospect of even a temporary relief to the dreary monotony of their daily existence. 'Do, pray, Captain Soanso, tell us all about him. Is he a real Robinson Crusoe?'

'Almost,' replied the captain, who, in obedience to his fair friends' request, then proceeded: 'Tristan d'Acunha, Nightingale, and Inaccessible Islands, form a group at about an equal distance of thirty miles from each other,

and 1500 miles from the Cape. The two latter are desolate; the former inhabited by a few English, whose advent and subsequent career have quite an air of romance.

'Whilst Napoleon Bonaparte was a prisoner in St Helena, the British government imagining that the French might occupy Tristan d'Acunha, as an intermediate point of communication with that island, determined on frustrating any such intention, by sending a detachment of soldiers from the Cape to garrison the island. When all fear of the escape of Bonaparte was at an end, the men were withdrawn; but several of them, including Glass, who had obtained his discharge, had become so much attached to their island-home, that they begged permission to return to it, and provide for their families, by cultivating good ground without paying rent, and occasionally going out to sea after seals and sea-elephants, and exchanging the skins and oil thus obtained for necessaries, with passing ships. Permission being granted, they soon afterwards sailed for their destination, being, by the kindness of their officer, plentifully supplied with all sorts of seed and different kinds of stock wherewith to commence their new undertaking.

'Soon after their arrival at the island, an event occurred which caused the utmost excitement amongst the colonists, and for a time had the effect of considerably increasing their limited society. It was this. One November morning, in the year 1821, a strange-looking craft, of indescribable rig, was observed standing in towards the island. No one could make her out. What could she be? where from? whither bound? severally exclaimed the astonished gazers as the boxlike-looking affair slowly and wearily approached their shores. To be in readiness to have the problem solved, and receive the strangers with the hearty welcome their evident state of exhaustion required, Glass and his companions proceeded to the landing-place, where the distressed mariners soon afterwards arrived. On landing, their tale was soon told. They proved to be a portion of the crew of the *Blenden Hall*, East Indiaman, which had been recently lost on Inaccessible Island during one of those fogs that are so prevalent round its inhospitable shores. The greater portion of her crew and passengers still remained on the island, obtaining a precarious subsistence from the flesh of sea-elephants, seals, penguins, and their eggs, the island being destitute of anything else, with the exception of a small supply of brushwood for firing. Two months after their shipwreck, a boat, or rather a case, was formed of the planks of the wreck, for the purpose of going to Tristan d'Acunha to obtain assistance. Six of the crew embarked in her, but were never heard of afterwards. A second boat of a similar description was then built, which, as it will have been seen, was more fortunate in the perilous undertaking, and arrived safely at Tristan d'Acunha after a weary and dangerous pull of thirty miles.

'On hearing the foregoing account, Glass gallantly determined to effect the rescue of the forlorn party, and without delay launched two of his whale-boats, and with a good supply of bread, butter, milk, and other necessaries, started with his companions on their humane expedition. After three trips, in which they ran the greatest danger of being swamped or blown away to sea, Glass had the satisfaction of bringing off the whole party, and landing them in his sea-girl home, where they received the utmost attention during the remainder of their stay. Here the united community assisted at the marriage of one of the seamen of the *Blenden Hall* with a young maid-servant of one of the passengers, who determined on remaining on the island and sharing the fortunes of its governor.

'For several years after this occurrence, nothing worthy of note disturbed the monotonous quiet of

their lives. Their families increased, and their stock thrived and multiplied. They generally have a good supply of corn when the harvest turns out favourably, and an abundance of very large and fine potatoes. For a supply of clothes and many other necessaries, the islanders are entirely dependent on passing ships. So you may imagine, ladies and gentlemen,' continued the captain, 'with what joy an Indiaman full of passengers is welcomed in that distant part of her majesty's dominions, and how thankfully the most trifling gift is appreciated by these worthy people.'

Captain Soanoo having brought his narrative to a close, the dinner-party soon afterwards dispersed, profoundly impressed with the necessity of a cordial co-operation with our gallant host in his kindly plans for ameliorating the somewhat desolate condition of the poor islanders.

Great was the commotion when the captain's intention became publicly known. The news flew through the ship like wild-fire. Nowhere was the excitement more intense than in the midshipmen's berth, and on no one had the intelligence a more surprising effect than on Bobstay, our junior youngster, who, having formed a romantic attachment for Elizabeth, the pretty lady's-maid, as a matter of course proposed an elopement to the land of the free, which, however, was most prudently negatived by the fair lady herself.

'Eight bells, there: come, bear a hand; and there out, Harry—there's land ahead!' sung out one of my messmates the next morning at the early hour of four.

Under the peculiar circumstances of the case, my jump from my hammock landed me on deck; a second into my blanket-trousers; and a third, up the main-ladder to the upper-deck, where the tall conical top of the island of Tristan d'Acunha—rising some 300 feet above the level of the sea—could be plainly seen, looming like some monster phantom through the gray of the early morning light. During the night the wind had considerably decreased, and the ship was running down towards the island under all plain sail. As the hours flew by, and the sun rose, and shone on the then tranquil and glittering sea, the scene was one of the most intense interest; and as we lessened our distance, the markings of the island became more and more distinct. Perpendicular cliffs, burned green and red by an extinct volcano, rose to an immense height above the sea, and then inclined inward, covered with wood; only to rise again bare and sloping to the apex of the mountain, which was capped with a cloud as white as the snow beneath. Innumerable sea-birds, from the little petrel to the stately albatross, floated round the summits of the lofty cliffs; the huge wings of the latter apparently motionless, yet swift as the 'arrow's flight,' as the bird glided through the aerial space towards its wild retreat in the inaccessible crevices of the rocks of the island.

As we rapidly advanced on our course, we could plainly see, by the aid of our glasses, numerous seals and sea-otters basking and playing on the ledges of rocks at the base of the cliffs, where, in close proximity, gambled those shapeless masses, with almost human faces, known as sea-elephants. It was an exciting scene, and everybody was on deck enjoying the pleasant change attendant on a smooth sea and fine weather. Passengers were everywhere busy with the Dollonds, and asking innumerable questions of those who had previously visited the locality, the replies being scarcely heeded, as fresh novelties came crowding one after another.

Presently, a wreath of smoke was seen rising from a point of low land, and floating away in voluminous clouds to leeward.

'There goes the bonfire!' exclaimed the captain. 'We shall soon see the island-boat coming out from the land.'

'Do they usually make this kind of signal?' inquired one of the passengers.

'Invariably,' replied the captain. 'Whenever a vessel heaves in sight, the islanders are always on the alert; and to attract attention, whenever a ship is near enough to see it, they set fire to a large heap of brush-wood, constantly kept in readiness for the purpose.'

'Here comes the boat!' exclaimed several voices, as a handsome whale-boat, manned with four sturdy rowers, was observed dashing out from the land, and pulling rapidly in the direction of the ship.

'Round her to, and shorten sail, Mr Bowline: we will not venture in any further,' said the commander, as we opened the point, on which was proudly waving the Union-jack, and saw the white surf rolling in on the landing-place, though it was comparatively calm outside.

As the ship came up sluggishly in the wind, dragging through the dense mass of sea-weed that surrounds the island, she quickly felt its force, which was not so perceptible while running. Sail was then reduced to the top-sails, jib, and spanker, for the weather round these islands is dangerous and deceitful in the extreme. At one moment, a ship may be sailing with scarcely enough of wind to fill her sails; and the next, a puff will come down the mountain, and carry everything by the board, unless precaution be taken in time. During our visit, the wind happened to be light while we lay to off the island, and the barometer was very high; but we had scarcely left it, when a gale came on suddenly from the northward, with the usual accompaniments of a heavy sea and thick rainy weather.

In the meanwhile, the state-barge for the nonce, containing the governor, came alongside. On reaching the quarter-deck, both himself and comrades were received with a hearty welcome by every one who had the pleasure of a personal introduction. Glass was a stout, hearty-looking man, and appeared rejoiced to see us. Through the liberality of the passengers, he was presented with a good stock of clothes, blankets, and books, our kind-hearted captain adding a fine calf, and various sorts of grain for seed, besides other stores too numerous to mention. It appeared on inquiry that a large increase in the population had taken place since the captain's last visit; the number now amounting to forty-one, exclusive of the governor's son, who was absent on his travels.

The interchange of presents having taken place—first from the island being a magnificent pig, one of the numerous wild ones that luxuriate along its sea-bound shores, a leg of which, by the by, fell to the share of our hungry mess—an expedition to the lake was determined on, which, with the exception of the ladies, was accompanied by the whole of the passengers.

Under the skilful pilotage of the governor in person, a rather fatiguing pull through the mass of tangled sea-weed soon brought the party to Falmouth Bay, where a landing was effected without difficulty. Ours being the first Indianman that had called at the island for four years, the advent of so large a party caused considerable bustle amongst the delighted inhabitants, especially when it became known that a public ceremony, unprecedented in the annals of that solitary and distant spot, was about to take place.

After a pleasant stroll through the settlement, where every house was open with the most lavish hospitality, and a minute inspection of the live-stock, which amounted to fifty head of cattle, nearly a hundred sheep, besides pigs and poultry *ad infinitum*, the inhabitants were assembled in the presence of one of the passengers, who, being a clergyman, took advantage of the opportunity to baptise twenty individuals of both sexes, from the infant of a few months old to the youth of eighteen. After an impressive address, which was listened to with great attention, a baptismal

register was made out, and delivered to Glass, as a lasting memorial of this important era in the uneventful history of these primitive people, the younger portion of whom had never even seen a clergyman before.

At the close of the service, as if in honour of the occasion, the boom of a gun from our gallant ship was borne across the water. From the lowering appearance of the distant horizon, we were not very far wrong in interpreting it as a signal from Mr Bowline, who was evidently getting impatient at the delay. Even the old craft herself appeared to sympathise with her chief officer, and as if in deprecation of the danger of a more protracted stay in that wild locality, anticipated her departure by a series of low courtesies in a long farewell to its iron-bound coasts. Accordingly, shortly afterwards, the party embarked, and after a lengthened farewell, left their new-made friends to their pristine solitude. And with a long pull, a strong pull, and a pull altogether, the little flotilla struck out for its destination, which it reached in safety shortly afterwards. A quarter of an hour elapsed, and the old craft was staggering along under as much sail as she could carry to a freshening gale, which soon carried her far from our friend the governor and his lonely isle.

HOW TO FILL YOUR BASKET.

How? Why, there are many ways.

The editor, for instance, as he sits at his desk poring over the voluminous manuscripts kindly proffered to him by aspiring poets, novelists, or moralists, discriminates between the suitable and unsuitable; and the result is, that the former are placed in the printer's hands, while the latter, if not returned, get into basket.

How? The rag-picker could answer the question, by informing us that *his* only chance is to be astr before the busy world has doffed its night-cap, that he may pick his rags in peace, and be sure to fill his basket.

The basket we allude to at present, however, is the *angler's* basket. Angling was a mania of ours in the olden time, and we laughed in our sleeve at those of our brethren who were content with a creel of medium size. We equipped ourselves likewise with flies of every hue, bait-hooks of every size, rods of the most ingenious workmanship, and we would not like to say how many spare tops; pocket-books with elaborate interiors, capable of containing tackle for a ten years' residence in Norway, pirns, lines, and gut exhaustless; and with some dozen casts—each fly differing from its neighbour—wound round our white beaver; and so we would take our journey northward, inwardly resolved to leave an immortal line of glory behind us wherever our piscatorial steps should stray. Strange, however, our success was never commensurate with our preparations; we had miscalculated the season, taken the river at its worst time, were harassed by others pertinaciously whipping the water a hundred yards further down the stream, or had failed to strike the precise infinitesimal degree of shade of the flies on the water that day. We never failed, in short, to find an ingenious excuse; and as we drew in our chair towards the fire in the snug parlour of the 'Gordon Arms,' to describe our sport to others of a similar persuasion, we blessed those never-failing apologies—thunder in the air, white clouds, and the clearness of the water. 'If,' exclaimed we, 'those white clouds had but cleared off, how gloriously must the fine half-pounders have risen to our "Professors"!'.

Angling having been, as we said, a mania of ours, well do we remember how tedious was the month of April, and how often, whilst busied in our ducky counting-house in the city, recollections of that

glorious week in May last year would come over us; how often, too, we permitted the thrilling anticipation of our week's holiday in the north, not yet enjoyed, to blend with our anxieties respecting the money-market, or dealings in the Corn Exchange!

May arrived; we bade, alas! too short an adieu to our companionable ledgers and cash-books; and year after year, about the beginning of May, we were the envy of our brother-clerks for a whole fortnight.

We now find that nothing but—we must out with it—*sheer ignorance* was the reason why we never filled our basket! And we have lately received a complete solution of the why and wherefore: the truth is, that the generality of man was, up to the year 1857, devoid of the true secret of filling his basket with—trout!

Thanks to Mr Stewart, we have now before us a neat, handy little three-and-sixpenny volume, *The Practical Angler, or the Art of Trout-fishing, more Particularly Applied to Clear Water*,* containing certain hints and rules, which, had we known them when sojourning at the 'Gordon Arms' in those days, must, we are positive, have lent us the power of filling even our large basket, and saved us from resorting to the apologies of 'thunder in the air' and 'clear water!'

But it is our firm belief that neither we, nor any one else, ever dreamed of the possibility of killing fifteen or twenty pounds' weight of trout per diem, in a clear running stream. As for ourselves, we might fish ever so assiduously, and follow the course of the river for miles, casting our large gaudy flies far out on the stream, and following their motions with eager eye, without catching more than a couple of dozen by dinner-time. But then we erred in fishing *down*, since our intended prey is always looking *up*; we erred in using large gaudy flies; we erred in casting a *long* line. Mr Stewart's long and careful experience has taught him, and he has taught us, that we should have fished *up* instead of *down*; that our large gaudy flies ought to have been left behind us in the 'Golden Perch,' and small, sparsely dressed ones used instead. He further informs us, and we feel intuitively that he is correct, that the speckled tenants of Yarrow or Tweed would have been lured, in spite of their teeth, towards a wood-cock wing with a single turn of a red hackle, dressed with yellow silk; that an able supporter would have been found in a hare-lug body, with a corn-bunting or chaffinch wing, and several other equally killing flies which he describes. Our authority, for we may swear by him, also places side by side with those the black spider, the red spider, and the dun spider!

Here is food for the fishes, simply prepared, without show, and tied on to *thin* and transparent gut; and there at present lie in our reasonably sized pocket-book—our last purchase—half-a-dozen of each of the above, dubbed by the hands of the Practical Angler himself, and presented to us along with his book.

We now see clearly, where all was mystery before, why we lost so many trout—and we were always sure they were the largest—when angling in the Tweed. We were somewhat proud in those days of our dexterity in throwing a long line, and of our management of a sixteen-foot rod; but now our pride has had a sad fall, since we learn that by the use of a short ten-foot rod, moderately stiff, with a short line, we might have doubled, perhaps quadrupled, our 'take;' and joined to this, had we but fished *up*, used the wood-cock-wings, dotterel-wings, or black and dun spiders, keeping all the while *out of sight* of our wary prey, what a pleasing load might we not have borne to the Gordon Arms—how patronisingly we should have cheered our less successful brethren—what glorious accounts imparted to our holiday-looking-forward-to brother-clerks in the city!

Let not the reader imagine from the foregoing that

our hero's forte lies in fly-fishing alone, or that he has tested his skill upon one or two streams at the most; our angling friends have only to refer to his little book to find that he has made observations from many a stream and loch; that he has gained also useful hints from the most successful professional and amateur fishers of the day, and that he has not failed to turn them to account for the benefit of the angling world. His experience has taught him that successful anglers have ever been *keen observers*. We never were keen observers in the days we have alluded to, but are now willing and ready to add as much as we can of that indispensable to the other qualities of an angler—namely, quickness of eye, energy, and boundless perseverance; so that we may hope some fine day to come home, as well as Mr Stewart, with our fifteen dozen and our basket full.

We will not dwell longer upon this, a favourite theme, but will take the opportunity of remarking, that when our friends have carefully perused *The Practical Angler*, and after that, whether they take the train to the north or to the south, it will be their own fault if they do not know how to fill their basket.

We shall conclude with an extract shewing the practical style in which this little work is written; and that the extract may be universally useful, it shall contain a complete angler's calendar, beginning with the present month: 'In the beginning of May it is of little use starting before eight o'clock in the morning, as the weather is generally cold; if the weather is warm, however, trout will take an hour or two earlier. When the waters are clear, the angler should commence with the creeper, and continue using it till he sees the take has commenced, when he should at once change to the fly, and make the most of his time. At this season, the take lasts longer than at any other, and if the day is favourable, the angler may kill the required quantity in a few hours in the forenoon. During the afternoon—that is to say, from two or three o'clock till six or seven—the minnow will frequently be found the best; and a very good plan is to fish up with the creeper and fly, and then back over the same ground with the minnow. If neither the creeper, fly, nor minnow will take, recourse must be had to the worm; but this is rarely the case; and unless on the occasion of a full flood, the angler may never have occasion to use the worm till the end of June. When the waters are in full flood, recourse must be had to the worm; and when they are rising or again falling, from the time that the particles of the mud begin to subside, until the waters become of a dark porter colour, the minnow will be found very deadly. The worm and the minnow should be used the whole season through when the waters are in the states just mentioned; but when they become of a dark porter colour, the lures appropriate to the season come into play, and in May, in such a case, reliance should always be placed upon the fly.

'About the middle of the month, the May-fly makes its appearance, and with it the angler will have no difficulty in filling his basket. In streams where the May-fly is not to be had, the angler should use worm and minnow in the morning; and whenever he observes the trout rising at the natural insect, change to the fly. The minnow will again be found effective in the evening. Even in streams where May-flies abound, minnow or worm will sometimes take better than they do early in the morning; and if the weather is very dark and stormy, the minnow will frequently be found most effective all day.

'When the May-flies have been two or three weeks on the water, or about the middle of June, they are not to be found in such numbers; the trout also do not take them so readily, and filling even a twelve-pound basket becomes rather difficult. The trout have given

up taking fly readily, and have not yet begun to take worm; they appear to be resting after the high feeding they have enjoyed for the last six weeks. Loch-fishing being now in its prime, the angler would do well to give it a trial, as he will not lose much by a ten days' absence from the rivers. In these, the worm and minnow in the morning, the fly in the forenoon, and the minnow and fly in the evening, will be found the best means of filling a basket; and in small waters and hill-burns, trout will now take the worm readily.

'From the middle to the end of June, worm-fishing commences; and from this period to the end of July large basketsful of trout may be depended upon, no matter what the state of weather or water. A good arrangement for a day's trouting at this season is to start very early in the morning—the earlier the better—and fish down a few miles with the minnow, and then fish back again with the worm; or if the angler has not the gift of early rising, he may start about breakfast-time, taking his dinner with him, and fish up with the worm, and down again with the minnow in the evening. If the weather is dark and stormy, the minnow will frequently be found most deadly during the whole day.

'About the beginning of August, another change begins to take place in the inclinations of the trout. Unless the weather is showery, or particularly favourable, they will not take the worm readily; and frequently only take it for an hour or so in the heat of the day. There is also a visible falling off in the size of the trout caught with it—a sure sign with any kind of fishing that it is approaching a termination. Nor will the minnow, unless the streams are swollen, aid the angler in his emergency; there is nothing for it but to have recourse to the more backward districts and smaller waters.

'About the end of August, trout begin to take the fly freely, and continue doing so all through September; and reliance can generally be placed upon it, particularly in coloured water: should it fail, recourse must be had to some hill-burn, where the worm will always be found effective.

'By the beginning of October, all the spawning trout are out of condition; the small ones, however, which do not spawn, afford very good diversion until late in the month, by which time even they are quite unworthy of the attention of the sportsman.'

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXIV.—A LILLIPUTIAN FOREST.

As resuming the trail, I moved with lighter spirit. I had three sources of gratulation. The peril of the flood was past—she was not drowned. The wolves were thrown off—the dangerous rapid had deterred them; on the other side their footprints were no longer found. Thirdly, the steed had slackened his pace. After climbing the bank, he had set off in a rapid gait, but not at a gallop.

'He's been pacin' hyar!' remarked Garey, as soon as his eyes rested upon the tracks.

'Pacin'?'

I knew what was meant by this; I knew that gait peculiar to the prairie-horse, fast but smooth as the amble of a palfrey. His rider would scarcely perceive the gentle movement; her torture would be less.

Perhaps, too, no longer frightened by the fierce pursuers, the horse would come to a stop. His wearied limbs would admonish him, and then—Surely he could not have gone much further?

We too were wearied, one and all; but these pleasing conjectures beguiled us from thinking of our toil, and we advanced more cheerfully along the trail.

Alas! it was my fate to be the victim of alternate hopes and fears. My new-sprung joy was short-lived, and fast fled away.

We had gone but a few hundred paces from the river, when we encountered an obstacle, that proved not only a serious barrier to our progress, but almost brought our tracking to a termination.

This obstacle was a forest of oaks, not *giant oaks*, as these famed trees are usually designated, but the very reverse—a forest of *dwarf oaks* (*Quercus nana*). Far as the eye could reach extended this singular wood, in which no tree rose above thirty inches in height! Yet was it no thicket—no under-growth of shrubs—but a true forest of oaks, each tree having its separate stem, its boughs, its lobed leaves, and its bunches of brown acorns.

'Shin oak,' cried the trappers, as we entered the verge of this miniature forest.

'Wagh!' exclaimed Rube, in a tone of impatience, 'hyur's bother. 'Ee may all get out o' ynr saddles an rest yur critters: we'll hev to crawl hyur.'

And so it resulted. For long weary hours we followed the trail, going not faster than we could have crawled upon our hands and knees. The tracks of the steed were plain enough, and in daylight could have been easily followed; but the little oaks grew close and regular as if planted by the hand of man; and through their thick foliage the moonlight scarcely penetrated. Their boughs almost touched each other, so that the whole surface lay in dark shadow, rendering it almost impossible to make out the hoof-prints. Here and there, a broken branch or a bunch of tossed leaves—their under-sides shining glaucous in the moonlight—enabled us to advance at a quicker rate; but as the horse had passed gently over the ground, these 'signs' were few and far between.

For long fretful hours, we toiled through the 'shin-oak' forest, our heads far overtopping its tallest trees! We might have fancied that we were threading our way through some extended nursery. The trail led directly across its central part; and ere we had reached its furthest verge, the moon's rays were mingling with the purple light of morning.

Soon after the 'forest opened;' the little dwarfs grew further apart—here scattered thinly over the ground, there disposed in clumps or miniature groves—until at length the sward of the prairie predominated.

The trouble of the trackers was at an end. The welcome light of the sun was thrown upon the trail, so that they could lift it as fast as we could ride; and, no longer hindered by brake or bush, we advanced at a rapid rate across the prairie.

Over this ground the steed had also passed rapidly. He had continued to pace for some distance, after emerging from the shin-oak forest; but all at once, as we could tell by his tracks, he had bounded off again, and resumed his headlong gallop.

What had started him afresh? We were at a loss to imagine; even the prairie-men were puzzled.

Had wolves again attacked him, or some other enemy? No; nor one nor other. It was a green prairie over which he had gone, a smooth sward of mezquite-grass; but there were spots where the growth was thin—patches nearly bare—and these were

softened by the rain. Even the light paw of a wolf would have impressed itself in such places, sufficiently to be detected by the lynx-eyed men of the plains. The horse had passed since the rain had ceased falling. No wolf, or other animal, had been after him.

Perhaps he had taken a start of himself, freshly affrighted at the novel mode in which he was ridden—still under excitement from the rough usage he had received, and from which he had not yet cooled down; perhaps the barbed points of the cohates rankled in his flesh, acting like spurs; perhaps some distant sound had led him to fancy the hooting mob, or the howling wolves, still coming at his heels; perhaps—

An exclamation from the trackers, who were riding in the advance, put an end to these conjectures. Both had pulled up, and were pointing to the ground. No words were spoken—none needed. We all read with our eyes an explanation of the renewed gallop.

Directly in front of us, the sward was cut and scored by numerous tracks. Not four, but four hundred hoof-prints were indented in the turf—all of them fresh as the trail we were following—and amidst these the tracks of the steed, becoming intermingled, were lost to our view.

'A drove of wild-horses,' pronounced the guides at a glance. They were the tracks of unshod hoofs, though that would scarcely have proved them wild. An Indian troop might have ridden past without leaving any other sign; but these horses had not been mounted, as the trappers confidently alleged; and among them were the hoof-marks of foals and half-grown colts, which proved the drove to be a *caballada* of mustangs.

At the point where we first struck their tracks they had been going in full speed, and the trail of the steed converged until it closed with theirs at an acute angle.

'Ye-es,' drawled Rube, 'I see how 'tis. They've been skeeart at the awkurd look o' the hoss, an hev put off. See! thur's his tracks on the top o' all o' theirn: he's been runnin arter 'em. Thur!' continued the tracker, as we advanced—'thur he hez overtuk some o' 'em. See! thur! the vamints hev scattered right an left! Hyur agin, they've galliped thegither, some ahint, an some afore him. Wag! I guess they know him now, an ain't any more afeerd o' him. See thur! he's in the thick o' the drove.'

Involuntarily I raised my eyes, fancying from these words that the horses were in sight; but no; the speaker was riding forward, leaning over in his saddle, with look fixed upon the ground. All that he had spoken he had been reading from the surface of the prairie—from hieroglyphics to me unintelligible, but to him more easily interpreted than the page of a printed book.

I knew that what he was saying was true. The steed had galloped after a drove of wild-horses; he had overtaken them; and at the point where we now were, had been passing along in their midst!

Dark thoughts came crowding into my mind at this discovery—another shadow across my heart. I perceived at once a new situation of peril for my betrothed—new, and strange, and awful.

I saw her in the midst of a troop of neighing wild-horses—stallions with fiery eyes and red steaming nostrils; these perhaps angry at the white steed, and jealous of his approach to the *manuda*; in mad rage rushing upon him with open mouth and yellow glistening teeth; rearing around and above him, and striking down with deadly desperate hoof—O it was a horrid apprehension, a fearful fancy!

Yet, fearful as it was, it proved to be the exact

shadow of a reality. As the mirage refracts distant objects upon the retina of the eye, so some spiritual mirage must have thrown upon my mind the image of things that were real. Not distant, though then unseen—not distant was the real. Rapidly I ascended another swell of the prairie, and from its crest beheld almost the counterpart of the terrible scene that my imagination had conjured up!

Was it a dream? was it still fancy that was cheating my eyes? No; there was the wild-horse drove; there the rearing, screaming stallions; there the white steed in their midst—he too rearing erect—there upon his back—

'O God! look down in mercy—save her! save her!'

CHAPTER LXV.

SCATTERING THE WILD STALLIONS.

Such rude appeal was wrung from my lips by the dread spectacle on which my eyes rested.

I scarcely waited the echo of my words; I waited the counsel of my comrades, but, plunging deeply the spur, galloped down the hill in the direction of the drove.

There was no method observed, no attempt to keep under cover. There was not time either for caution or concealment. I acted under instantaneous impulse and with but one thought—to charge forward, scatter the stallions, and, if yet in time, save her from their hurling heels and fierce glittering teeth.

If yet in time—ay, such provisory parenthesis was in my mind at the moment. But I drew hope from observing that the steed kept a ring cleared round him: his assailants only threatened at a distance.

Had he been alone, I might have acted with caution, and perhaps have thought of some stratagem to capture him. As it was, stratagem was out of the question; the circumstances required speed.

Both trappers and rangers, acting under like impulse with myself, had spurred their horses into a gallop and followed close at my heels.

The drove was yet distant. The wind blew from them—a brisk breeze. We were half-way down the hill, and still the wild-horses neither heard, saw, nor scented us.

I shouted at the top of my voice: I wished to startle and put them to flight. My followers shouted in chorus; but our voices reached not the quarrelsome *caballada*.

A better expedient suggested itself: I drew a pistol from its holster, and fired several shots in the air.

The first would have been sufficient. Its report was heard, despite the opposing wind; and the mustangs, affrighted by the sound, suddenly forsook the encounter. Some bounded away at once; others came wheeling around us, snorting fiercely, and tossing their heads at the air; a few galloped almost within range of our rifles, and then uttering their shrill neighing, turned and broke off in rapid flight. The steed and his attendants alone remained, where we had first observed them.

For some moments he kept the ground, as if bewildered by the sudden scattering of his assailants; but he too must have heard the shots, and perhaps alone divined something of what had caused the singular noises. In the loud concussion, he recognised the voice of his greatest enemy; and yet he started from the spot!

Was he going to await our approach? Had he become tamed?—reconciled to captivity? or was that we had rescued him from his angry rivals—he was grateful, and no longer feared us?

Such odd ideas rushed rapidly through my mind as I hurried forward. I had begun to deem it probable that he would stay our approach, and suffer us to recapture him. Alas! I was soon undeceived.

was still a long way off—many hundred yards—when I saw him rear upward, wheel round upon his hind-feet as on a pivot, and then bound off in determined flight. His shrill scream pealing back upon the breeze, fell upon my ears like the taunt of some deadly foe. It seemed the utterance of mockery and revenge: mockery at the impotence of my pursuit; revenge that I had once made him my captive.

I obeyed the only impulse I could have at such a moment, and galloped after, as fast as my horse could go. I stayed for no consultation with my companions; I had already forged far ahead of them. They were too distant for speech.

I needed not their wisdom to guide me. No plan required conception or deliberation; the course was clear: by speed only could the horse be taken, and his rider saved from destruction—*if yet safe*.

O the fearfulness of the last reflection! the agony of the doubt!

It was not the hour to indulge in idle anguish; I repressed the emotion, and bent myself earnestly upon the pursuit. I spoke to my brave steed, addressing him by name; I urged him with hands and knees; only at intervals did I inflict the cruel steel upon his ribs.

I soon perceived that he was flagging; I perceived it with increased apprehension for the result. He had worn his saddle too long on the day before, and the wet weary night had jaded him. He had been overwrought, and I felt his weariness, as he galloped with feebler stroke. The prairie-steed must have been fresh in comparison.

But life and death were upon the issue. Her life—perhaps my own. I cared not to survive her. She must be saved. The spur must be plied without remorse: the steed must be overtaken, even if Moro should die!

It was a rolling prairie over which the chase led—a surface that undulated like the billows of the ocean. We galloped transversely to the direction of the 'swells,' that rose one after the other in rapid succession. Perhaps the rapidity with which we were crossing them brought them nearer to each other. To me there appeared no level ground between these land-billows. Up hill and down hill in quick alternation was the manner of our progress—a severe trial upon the girths—a hard killing gallop for my poor horse. But life and death were upon the issue, and the spur must be plied without remorse.

A long cruel gallop—would it never come to an end? would the steed never tire? would he never stop? surely in time he must become weary? Surely Moro was his equal in strength as in speed?—superior to him in both?

Ah! the prairie-horse possessed a double advantage—he had started fresh—he was on his native ground.

I kept my eyes fixed upon him; not for one moment did I withdraw my glance. A mysterious apprehension was upon me; I feared to look around, lest he should disappear. The souvenirs of the former chase still haunted me; weird remembrances clung to my spirit. I was once more in the region of the supernatural.

I looked neither to the right nor left, but straight before me—straight at the object of my pursuit, and the distance that lay between us. This last I continuously scanned, now with fresh hope, and now again with doubt. It seemed to vary with the ground. At one time, I was nearer, as the descending slope gave me the advantage; but the moment after, the steep declivity retarded the speed of my horse, and increased the intervening distance.

It was with joy I crossed the last swell of the rolling prairie, and beheld a level plain stretching before us. It was with joy I perceived that upon the new ground I was rapidly gaining upon the steed!

And rapidly I continued to gain upon him, until

scarcely three hundred yards were between us. So near was I, that I could trace the outlines of her form—her prostrate limbs—still lashed to the croup—her garments loose and torn—her ankles—her long dark hair dishevelled and trailing to the ground—even her pallid cheek I could perceive, as at intervals the steed tossed back his head to utter his wild taunting neigh.

I was near enough to be heard. I shouted in my loudest voice; I called her by name. I kept my eyes upon her, and with throbbing anxiety listened for a response. I fancied that her head was raised, as though she understood and would have answered me. I could hear no voice, but her feeble cry might have been drowned by the clatter of the hooves.

Again I called aloud—again and again pronouncing her name.

Surely I heard a cry; surely her head was raised from the withers of the horse. I could not be mistaken.

'Thank Heaven, she lives!'

I had scarcely uttered the prayer, when I felt my steed yield beneath me as though he was sinking into the bosom of the earth. I was hurled out of the saddle, and flung head-foremost upon the plain. My horse had broken through the burrow of the prairie marmot, and the false step had brought him with violence to the ground.

I was neither stunned nor entangled by the fall; and in a few seconds had regained my feet, my bridle, and saddle. But as I headed my horse once more toward the chase, the white steed and his rider had passed out of sight.

CHAPTER LXVI.

LOST IN A CHAPPARAL.

I was chagrined, frantic, and despairing, but not surprised. This time there was no mystery about the disappearance of the steed; the chapparral explained it. Though I no longer saw him, he was yet within hearing. His footfall on the firm ground, the occasional snapping of a dead stick, the whisk of the recoiling branches, all reached my ears as I was remounting.

These sounds guided me, and without staying to follow his tracks, I dashed forward to the edge of the chapparral—at the point nearest to where I heard him moving. I did not pause to look for an opening, but heading in the direction whence came the sounds, I spurred forward into the thicket. Breasting the bushes that reached around his neck, or bounding over them, my brave horse pressed on; but he had not gone three lengths of himself before I recognised the imprudence of the course I was pursuing: I now saw I should have followed the tracks.

I no longer heard the movements of the steed—neither foot-stroke, nor snapping sticks, nor breaking branches. The noise made by my own horse, amid the crackling acacias, drowned every other sound; and so long as I kept in motion, I moved with uncertainty. It was only when I made stop that I could again hear the chase struggling through the thicket; but now the sounds were faint and far distant—growing still fainter as I listened.

Once more I urged forward my horse, heading him almost at random; but I had not advanced a hundred paces, before the misery of uncertainty again impelled me to halt.

This time I listened and heard nothing—not even the recoil of a bough. The steed had either stopped, and was standing silent, or, what was more probable, had gained so far in advance of me that his hoof-stroke was out of hearing.

Half frantic, angered at myself, too much excited for cool reflection, I lanced the sides of my horse, and galloped madly through the thicket.

I rode several hundred yards before drawing bridle, in a sort of desperate hope I might once more bring myself within earshot of the chase.

Again I halted to listen. My recklessness proved of no avail. Not a sound reached my ear: even had there been sounds, I should scarcely have heard them above that issuing from the nostrils of my panting horse; but sound there was none. Silent was the chapparal around me—silent as death; not even a bird moved among its branches.

I felt something like self-execration: my imprudence I denounced over and over. But for my rash haste, I might yet have been upon the trail—perhaps within sight of the object of pursuit. Where the steed had gone, surely I could have followed. Now he was gone I knew not whither—lost—his trail lost—all lost!

To recover the trace of him, I made several casts across the thicket. I rode first in one direction, then in another, but all to no purpose. I could find neither hoof-track nor broken branch.

I next bethought me of returning to the open prairie, there retaking the trail, and following it thence. This was clearly the wisest, in fact, the only course in which there was reason. I should easily recover the trail, at the point where the horse had entered the chapparal, and thence I might follow it without difficulty.

I turned my horse round, and headed him in the direction of the prairie—or rather in what I supposed to be the direction—for this too had become conjecture.

It was not till I had ridden for a half-hour, for more than a mile through glade and bush—not till I had ridden nearly twice as far in the opposite direction—and then to right, and then to left—that I pulled up my broken horse, dropped the rein upon his withers, and sat bent in my saddle under the full conviction that I too was lost!

Lost in the chapparal—that parched and hideous jungle, where every plant that carries a thorn seemed to have place. Around grew *acacias*, *mimosas*, *gleditschias*, *robinias*, *algarobias*—all the thorny legumes of the world; above towered the splendid *fouquieria* with spinous stem; there flourished the 'tornillo' (*prosopis glandulosa*), with its twisted beans; there the 'junco' (*koelerinia*), whose very leaves are thorns. There saw I spear-pointed yuccas and clawed bromelias (*agave* and *dasyliro*); there, too, the universal cactaceæ (*opuntia*, *mammillaria*, *cereus*, and *echinocactus*); even the very grass was thorny—for it was a species of the 'mezquite-grass,' whose knotted culms are armed with sharp spurs!

Through this horrid thicket I had not passed unscathed; my garments were already torn, my limbs were bleeding.

My limbs—and hers?

Of hers alone was I thinking: those fair-proportioned members—those softly rounded arms—that smooth delicate skin—bosom and shoulders bare—the thorn—the scratch—the tear. Oh! it was agony to think!

By action alone might I hope to still my emotions; and once more rousing myself from the lethargy of painful thought, I urged my steed onward through the bushes.

CHAPTER LXVII.

ENCOUNTER WITH JAVALI.

I had no mark to guide me, either on the earth or in the heavens. I had an indefinite idea that the chase had led westward, and therefore to get back to the prairie, I ought to head towards the east. But how was I to distinguish east from west? In the chapparal both were alike, and so too upon the sky. No sun was visible; the canopy of heaven was of a uniform leaden colour; upon its face were no signs by which the cardinal points could have been discovered.

Had I been in a forest of trees, surrounded by a

northern *sylva*, I could have made out my course. The oak or the elm, the ash-tree or maple, the beech or sycamore—any of them would have been compass sufficient for me; but in that thicket of thorny shrubs I was completely at fault. It was a subtropical flora, or rather a vegetation of the arid desert, to which I was almost a stranger. I knew there were men skilled in the craft of the chapparal, who, in the midst of it, could tell north from south without compass or star. Not I.

I could think of no better mode than to trust to the guidance of my horse. More than once, when lost in the thick forest or on the boundless plain, had I reposed a similar trust in his instincts—more than once had he borne me out of my bewilderment.

But whither could he take me? Back to the path by which we had come? Probably enough, had that path led to a home; but it did not: my poor steed, like myself, had no home. He, too, was a ranger; for years had been fitting from place to place, hundreds, ay, thousands of miles from each other. Long had he forgotten his native stall.

I surmised that if there was water near, his instinct might carry him to that—and much needed it both horse and rider. Should we reach a running stream, it would serve as a guide.

I dropped the rein upon his neck, and left him to his will.

I had already shouted in my loudest voice, in hopes of being heard by my comrades; by none other than them, for what could human being do in such a spot, shunned even by the brute creation? The horned lizard (*agama cornuta*), the ground rattlesnake, the shell-covered armadillo, and the ever-present coyote, alone inhabit these dry jungles; and now and then the javali (*dicotyles torquatus*), feeding upon the twisted legumes of the 'tornillo,' passes through their midst; but even these are rare; and the traveller may ride for scores of miles through the Mexican chapparal without encountering aught that lives and moves. There reigns the stillness of death. Unless the wind be rustling among the pinnate fronds of the *acacia*, or the unseen locust utters its harsh shrieking amid the parched herbage, the weary wayfarer may ride on, cheered by no other sound than his own voice, or the footfall of his horse.

There was still the chance that my followers might hear me. I knew that they would not stray from the trail. Though they must have been far behind when I entered the chapparal, following the tracks, they would in time be sure to come up.

It was a question whether they would follow mine, or that of the steed. This had not occurred to me before, and I paused to consider it. If the former, then was I wrong in moving onward, as I should only be going from them, and leading them in a longer search. Already had I given them a knot to unravel, my devious path forming a labyrinthine maze.

It was more than probable they would follow me—in the belief that I had some reason for deviating from the trail of the steed, perhaps for the purpose of heading or intercepting him.

This conjecture decided me against advancing further—at least until some time should elapse, enough to allow them to come up with me.

Out of compassion for my hard-breathing horse, I dismounted. At intervals, I shouted aloud, and fired shots from my pistols: after each I listened; but neither shot nor shout reached me in reply. They must be distant indeed, not to hear the report of firearms; for had they heard them, they would have been certain to make answer in a similar manner. All of them carried rifles and pistols.

I began to think it was time they should have reached me. Again I fired several shots; but, as before, echo was the only reply. Perhaps they had

not followed me? perhaps they had kept on upon the trail of the steed, and it might lead them far away, beyond hearing of the reports? perhaps there was not yet time for them to have arrived?

While thus conjecturing, my ears were assailed by the screeching of birds at some distance off. I recognised the harsh notes of the jay, mingling with the chatter of the red cardinal.

From the tones, I knew that these birds were excited by the presence of some animal. Perhaps they were defending their nests against the black snake or the *crotalus*.

It might be my followers approaching? it might be the steed—like me, still wandering in the chapparal?

I sprang to my saddle to get a better view, and gazed over the tops of the trees. Guided by the voices of the birds, I soon discovered the scene of the commotion. At some distance off, I saw both jays and cardinals fluttering among the branches, evidently excited by something on the ground beneath them. At the same time I heard strange noises, far louder than the voices of the birds, but could not tell what was causing them. My spirits sank, for I knew they could not be produced either by my comrades or the steed.

It was not far, and I determined to satisfy myself as to what was causing such a commotion in this hitherto silent place. I rode towards the spot, as fast as my horse could make way through the bushes. I was soon satisfied.

Coming out on the edge of a little glade, I became spectator to a strange scene—a battle between the red cougar and a band of *javalis*.

The fierce little boars were 'ringing' the panther, who was fighting desperately in their midst. Several of them lay upon the ground, struck senseless or dead, by the strong paws of the huge cat; but the others, nothing daunted, had completely surrounded their enemy, and were bounding upon him with open mouths, wounding him with their sharp shining tusks.

The scene aroused my hunter instincts, and suddenly unslinging my rifle, I set my eye to the sights. I had no hesitation about the selection of my mark—the panther, by all means—and drawing trigger, I sent my bullet through the creature's skull, at once stretching him out in the midst of his assailants.

Three seconds had not elapsed, before I had reason to regret the choice I had made of a victim. I should have let the cougar alone, and either held my fire, or directed it upon one of his urchin-like enemies; for the moment he was *hors de combat*, his assailants became mine—transferring their 'surround' to my horse and myself, with all the savage fierceness they had just exhibited towards the panther!

I had no means of punishing the ungrateful brutes. They had not given me time to reload my rifle before commencing the attack, and my pistols were both empty. My horse, startled by the unexpected assault, as well as by the strange creatures that were making it, morted and plunged wildly over the ground; but go where he would, a score of the ferocious brutes followed, springing against his sides, and scoring his shanks with their terrible tusks. Well for me I was able to keep the saddle; had I been thrown from it at that moment, I should certainly have been torn to pieces.

I saw no hope of safety but in flight, and spurring my horse, I gave him full rein. Alas! through that tangled thicket the *javalis* could go as fast as he; and after galloping a hundred yards or so, I perceived the whole flock still around me, leaping as fiercely as ever around the limbs of my steed.

The result might have proved awkward enough; but at that moment I heard voices, and saw mounted men breaking through the underwood. They were Standfield, Quackenboss, and the rest of the rangers.

In another second they were on the ground; and their revolvers, playing rapidly, soon thinned the ranks of the *javalis*, and caused the survivors to retreat grunting and screaming into the thicket.

WHAT IS HEROISM?

EVERY tolerably forward school-boy is familiar with a number of stock anecdotes associated with classical names, and illustrative of the heroic virtues, self-sacrifice and fortitude. Many of these *ana* will scarcely bear criticism in point of authenticity; but it is one of the least grateful duties of the historian to withdraw from the domain of presumed reality those dramatic episodes and tableaux with which the Greek and Roman writers enliven the grammar-school instruction. In our boyish days, we learn to venerate the ancient senators, awaiting in their curule-chairs with dignified gravity the intrusion of uncouth invaders. We garner up in our memories the gallantry of Curtius and Cincinnatus, the patriotic integrity of Regulus and Cincinnatus; and we are naturally loath to listen to Niebuhr and Arnold, when they assure us that these, our fancy-men, never had existence save in the imaginations of ballad-singers, or the traditions of an unlettered people; or if they really abode in the flesh, never performed the acts attributed to them. Independently of such 'points' in mythic history, there are no doubt many similar incidents which, though ascribed to historical personages, are nevertheless fictitious. Our ancient friends were extremely partial to narratives of this kind, and in default of a sufficiency of authentic facts, supplied themselves with circumstantial *on dits*. These were repeated from mouth to mouth, until they became, like travellers' tales, a part of the popular belief, and obtained admission to the grave pages of the biographer and historian.

The question, however, whether or not these anecdotes, and others of the same class, were records of actual events, is immaterial to my present purpose; it is enough that they have been handed down from generation to generation, from the old civilisation to the new, and have challenged and received more or less admiration and applause. They picture to us the kind of heroism most in esteem amongst the ancients, and not without honour in later days. Leonidas and his three hundred; Aristides inscribing his own name on the ostracising shell of an illiterate citizen; Arris, by her own death, encouraging her husband to brave a similar fate; the elder Brutus, with a severe justice, scarcely enough tempered with mercy, condemning his own son to death for a trifling breach of military discipline, are instances of the kind to which I allude; and we can trace in them all the stoical and dignified behaviour regarded by the men of those days as the height of human virtue.

If we seek further to determine the main elements which gave to these actions their éclat, we shall find them to be an enthusiastic abnegation of self, and a somewhat exaggerated development of a single virtue. The actuating motive, whether patriotism, domestic affection, or a sentiment of honour, prevailed in an unusual degree, raised to the point of enthusiasm by peculiar circumstances of time and place, or peculiar character of mind. It would not be well to detract from the glory or quasi-glory of such exploits, by ascribing them to ignoble motives, or judging them according to the light of an after-age. Every action, however praiseworthy and virtuous in outward seeming, may be accounted for, if we so incline, by consummate hypocrisy, far-sighted selfishness, or immoderate pride. By hypothetical assumptions, we may attribute the public life of Washington to his greed for glory, or of Wilberforce to a puerile love of fame. He must be an intense sceptic in human nature who perversely refers every instance of apparent self-forgetfulness to

concealed self-love. I do not, then, doubt that such actions as I have referred to possessed that species of nobleness claimed for them; at all events, it is upon this assumption that they have been recorded as examples of heroism.

In modern times, illustrations of similar virtue are by no means infrequent, but they do not possess that classical sanction which is so powerful for good or ill, and too often elevates a sophism into a wise saw, and an act of dubious morality into a vaunted exemplar. For instance, a modern Scævola is scarcely entitled to approbation. I willingly admit the deserts of these heroes and heroines; nevertheless, a little consideration will shew, that examples of this type do not exhibit the highest forms of moral grandeur. It is obvious at once, that isolated acts, illustrating an impulsive virtue, and occurring at conjunctures of great emergency, are but doubtful guides to general character. The actors in such scenes are not necessarily so exalted or so high-spirited as we are at first likely to imagine. Wholesale experience has lately shewn that the devotion of soldiery is no rare attribute; and in order to create military heroes, we have only to provide a field of action. Neither are the self-sacrifices of affection peculiar to lofty characters. But there is a heroism of a higher kind, which is often not patent to the world, which requires no grand stage and no dramatic incidents to give it lustre.

Charles Lamb tells an instructive story relating to the culinary discovery of roast-pig. John Chinaman found among the ruins of a house destroyed by fire a sucking-pig beautifully cooked in the course of the conflagration. Being enchanted by the succulent dainty, he proceeded to burn down another house containing another sucking-pig. After considerable destruction of valuable property, a sage friend of John Chinaman pointed out that in order to procure burnt pig, it was not at all essential to burn down a house. With regard to heroism, we are apt to fall into the illogical reasoning of the Celestial epicure, and imagine that great crises are necessary to its development. Enthusiastic British youth, moved by the recital of heroic deeds of ancient or modern times, yearn to become performers of similar exploits: they are filled with regret that their surrounding circumstances are commonplace, that they have no Thermopylæ to defend and no Sebastopol to storm, that there is not the slightest occasion to imitate the Athenians under Themistocles, and embark their household gods. They crave the inducement of a tragic glory and opportunity to create an undying fame by a single effort. But the higher heroism of which I speak, avoids rather than seeks the pomp and circumstance of war and the glare of publicity. It is true that enthusiasm is for the most part respectable. Even when its results are most deplorable, it bears testimony to the moral and religious nature of man. It implies an acting up to principle, and a disregard of immediate selfish considerations. Enthusiasm, no less than laughter, distinguishes man from the lower creation; still, the self-sacrifices to which it impels, are not the most noble. We know it is not in moments of excitement that the voice of conscience is most readily heard and obeyed; we know that soldiers, after the first moments of the conflict, customarily lose all sense of danger, are urged on by a wild agitation of the spirits, and make the final assault in almost a state of delirium. The foundation of heroism of this kind is physical courage and common manly sentiment. We know, too, that enthusiasm, in the form of fanaticism, enables men to endure excruciating agonies without a cry: the lamas of Tibet inflict on themselves ghastly wounds; Hindoos suffer themselves to be hooked up by the muscles of the back, and swung round and round in that painful state of suspension, without murmur of complaint. Yet we cannot suppose these men to be braver, or

possessed of higher moral qualities, than the European who groans with the toothache, and is terribly distressed by a simple fracture of the arm.

The truest heroism requires for its exhibition calm reflection and deliberate will, rather than excitement. Instead of the heat of the affray, or the ardour of a mistaken faith, its groundwork is a sense of duty able to contend with conflicting and baser motives. Patient uncomplaining endurance—steady perseverance in overcoming obstacles—conduct always upright in good and evil report, when no human eye may see with commendation, and no human heart respond with sympathy—this is true heroism, and raises its possessor far beyond the ranks of those who plant the standard on a well-won breach. Such heroism as this requires no historical arena; it lies as much within the reach of the man of peace as of the warrior, of the private citizen as of the statesman or sage. If we were to obey the moral law unflinchingly, and kept to labour and wait, we should all be heroes, and stand on all hallowed ground. From this point of view, the reflective mind sees more heroism in the endurance of soldiers in the trenches, than in their courage in the assault. From this point of view, the scene of a company of soldiers going down with the *Osmond* in parade order, with their colonel at the head, strikes us as a greater triumph than that achieved by Leonidas and his three hundred brave, and we recognise in unfortunate wives who come before our police-courts bruised and disfigured by the barbarity of their husbands, and decline to give evidence against them, 'because they are only so weak in drink,' the Arrias of modern times. We do wrong, therefore, when we allow stage-effect and brilliant éclat to throw too much into the shade the less obtrusive heroism of private life. If any man has such accessories to be necessary to the display of a heroic spirit, he may be assured that he is under a wrong impression, and does not possess any special faculty at all. Vanity or ambition may enable him to bear the pains and penalties of such a spirit, or give himself the semblance of a hero; but if he wins the esteem and honour due to such a character, it is by means of false pretences, and the reward won will assuredly fail to become a recompense in enjoyment.

A PARISIAN LITTERATEUR.

THE voluminous autobiography of Alexandre Dumas is in many respects a very noticeable work, but none more so than in the minuteness of detail with which it depicts the career of a Parisian litterateur. If this detail were unmixt with extraneous matter, it would be all the more acceptable. Dumas has been the contemporary of many remarkable literary men and artists—with all of them he has been personally acquainted; with many he has lived on terms of intimacy; and if he had chosen to confine his reasonable limits an account of his relations with these men, his impressions of their works, with the anecdotal and information current in the literary, artistic, musical, and theatrical circles of Paris from the death of Louis XVIII. to the revolution of 1848—when the break-up took place—he would have produced a book not only amusing to his contemporaries at home, but instructive to the public of Europe at large, and a valuable contribution to social history.

Instead of confining himself to this, Alexandre Dumas has been seized with the unfortunate idea of incorporating in his personal memoirs the general political and diplomatic history of Europe, which he has already had in newspapers and blue-books, and which we are in course of having crystallised in the works of those professed historians whose business is to inform and who employ their leisure on subjects within the

speciality. Nothing more dreary than the political history of M. Alexandre Dumas, dramatised with its startling points and dénouements; it is like reading his own *Louis XIV.* after laying down Mezeray, or possessing a coupon of Royal British Bank Stock compared with one of the Bank of England; but in the other part of his work we feel that he stands on his own ground, and that he is there indeed a master. Like an oasis after a desert journey, nothing can be more agreeable than to go out of the hazy sandy atmosphere of politics to the verdant regions of art. A new poem of Hugo, a rehearsal at the Porte St Martin or the Odéon, a squabble with the critics, a soirée of artists; all such form the pleasant parts of the book.

The life of Alexandre Dumas commenced with the century; his father, whom he lost early, had rapidly risen to the rank of lieutenant-general in the republican armies; and we find, in the early part of the son's career, a meritorious struggle on the part of both widow and orphan to make ends meet. At length the ardent genius of the son, impatient of a residence in a provincial town, invited him to try his fortunes in Paris, the mother having been compelled to sell her house and farm. His first impulse was to look up to the friends of his father—Marshal Victor, Duke of Belluno; Marshal Jourdan; and Marshal, then General, Sebastiani. He was admitted to Marshal Jourdan, who imagined that the father whom he had believed dead was paying him a visit. But he had never heard that he had a son; and, in spite of all that young Dumas could say, he was dismissed in a few minutes, without the marshal being satisfied of his identity, or disposed to commence acquaintance. But he was more successful with General Foy, the French historian of the Peninsular war, and the most impressive of the orators of the opposition in 1823. General Foy lived in the Rue Mont Blanc, and Dumas found him working at his Spanish military history. He wrote standing at one of those tables that may be raised or lowered at will. All around him, on chairs and sofas, was a heterogeneous mass of printer's proofs, maps, books, and newspapers. The general himself was a man of fifty, thin, small, with his hair growing gray, a brow like the hemisphere of a cannon-ball, an aquiline nose, and a bilious complexion. He carried his head erect, his language was brief, and his gesticulation imperious.

'Ah!' said he, 'are you the son of the General Dumas who was in the army of the Alps?' To which an affirmative answer was given, with the presentation of a letter of introduction. 'But before I can be of use to you,' said the general, 'I must first know what you are good for. Do you know anything of mathematics?—algebra?—geometry?—natural philosophy?—Latin?—Greek?—or book-keeping?' To each of these interrogatories, enounced slowly by the general, a negative answer was given—the face of the aspirant youth reddening into the deepest scarlet, and the perspiration dropping from his brow. At last the general asked for his address, with some commiseration; but scarcely had he written his name, when the general said: 'We are saved! You have a beautiful hand-writing.' Dumas was not delighted in having a copying clerkship pointed out for his destination; but General Foy continued, saying: 'I dine to-day at the Palais Royal; I will speak of you to the Duke of Orleans, and see if it is not possible to get you into his office.'

A petition was written out by the future dramatic poet. The leader of the opposition—dining with the future king of the French, in the palace built by Richelieu—spoke of the son of the republican general; and the end of it was the appointment of Alexandre Dumas to a place of L.48 a year, in the office of the Duke of Orleans; for his property was so vast as to require a formal administration, like a small government department. Here the dramatist passed the first years of his residence in Paris, working during the day on

the details of the forest cuttings of Villars-Cotterets, or the rents of the Palais Royal; and at night, visiting the theatres, reading translations of Schiller and Shakspeare, and casting about for the materials of a drama of his own.

We have no space for the many droll stories which he gives of this period of his life—one of the best of which is his account of a first visit to a theatre, when he paid for a place in the *queue*, and being obstreperous upon having to pay at the bureau again, was turned out of the theatre. At this period, Dumas made the acquaintance of Frédéric Soulié, and he gives his opinion of this remarkable but unequal genius: he considers that Soulié had something obscure in his brain; his thoughts being like the world, lighted only on one side, the antipodes of the illuminated side being plunged in darkness; and that, notwithstanding the scenes of extraordinary power he has produced, he never knew how to begin or end a drama or a romance. Soulié began timidly, and exposed his action painfully, so that his fine scenes were arrived at after a disagreeable apprenticeship of the reader's or spectators' patience. He lived on a small pension which his father allowed him, in a modest apartment in the Rue de Provence, among the furniture of which was a piano, on which he used to play. Afterwards he became a man of business, engaged in a mechanical sawing establishment, and died some years ago, well off, his time divided between Apollo and Mercury.

The theatrical experiences of Dumas are the clearest portions of the memoirs. Talma was still on the stage, and its acknowledged monarch; Mademoiselle Mars was at the height of her reputation and power. We have all the quarrels of the old classical authors with the rising dramatists of the new school, who were declared to be not 'sons of France, but bastards of England and Germany.' As for Dumas's collaborations and plagiarisms, we have his share in the former stiffly argued, and the latter freely confessed. Our deliberate opinion—after having seen represented or having read his best works, as well as learned the opinion entertained of him by his Parisian colleagues—is, that he is a man of most marvellous powers of invention, of great fertility of resource, of great skill in the construction of dramas, and of great capacity for labour, in addition to natural gaiety of style and facility of production. He has not the high poetry of Lamartine or Hugo; but even if he had had no collaboration, he is still the man to have outstripped all others in abundance of effective dramas. His misfortune has been habits of prodigality, which have injured his personal fortunes and literary reputation. From the first he shewed great powers of construction and animated dialogue—the one the body, the other the soul of the drama—but unfortunately this necessity for the requisites of a profuse hospitality has compelled him, first of all, to involve himself in an extensive collaboration, and at last to lend his highly popular name to many works in which he had no hand whatever. He began with works of genius; he continued by the rearrangement of the raw materials of others with masterly skill; and at last arrived at such habits of labour as to be able to work from ten to fourteen hours a day, year after year. If we add to these enormous labours the number of works to which he lent his name without contributing a thought, his princely revenue and prodigal luxury cease to be a marvel.

Talma was the most important of his early theatrical acquaintances. This distinguished artist was born at Paris in 1766. His father was many years a celebrated dentist in London, who had among his patients the Prince of Wales, subsequently George IV.; and the *début* of the son was in 1787. From that time he retained undivided possession of the Paris stage. Talma had the four great qualities of an actor—person, expression of countenance, voice, and intellectual capacity.

Without being what the French call *un homme d'esprit* of an acute and lively conversation, he had great erudition in relation to his profession. When he was on the point of creating a part, he grudged no historical research that might throw light on the character, the transaction, or the nature of the epoch. In short, like our own Garrick, he appears to have been superior to all his predecessors and successors.

In high comedy, Mademoiselle Mars seems to have attained the same elevation. Dumas pronounces her to be an honest woman, severely exact in the fulfilment of all her agreements, and as punctual at rehearsals as a post-office clerk at his bureau. 'I beg pardon,' said she on the single occasion of her having been absent for a quarter of an hour; 'but I have just lost forty thousand francs. Vite, commençons!'

After many discussions, Dumas got his play of *Henri III.* accepted at the Théâtre Français; but his entrance into the temple of Thespia proved to be his exit from the service of the Duke of Orleans. M. de Broval, the director-general of the affairs of the Duke of Orleans, gave Dumas politely to understand that literature and bureaucracy were two enemies who could not live together, and that he must choose between them.

'I understand,' said the poet, 'that if I pursue my vocation of man of letters, I am dismissed.'

'Yes,' said the baron—whom the author, with a grudge, described as being a baron with a large red nose, and one shoulder higher than another.

'Then I decide for the career of letters,' rejoined the poet.

'And how will you support your mother?' said the baron.

'Oh, that is my affair,' added Dumas. And thus his independent career commenced.

But although no longer serving the Duke of Orleans in an economical capacity, he was by no means unwilling to have him for a literary patron. He therefore determined to ask him to be present at a representation of his piece. The future Louis-Philippe was a handsome man of fifty at that time, not so very fat as he subsequently became, with a lively, intelligent countenance, and affable manners, but which never went so far as to allow people to forget his rank, except when he had to do with some very vain member of the *bourgeoisie*, and had a point to gain. His voice was agreeable in speaking, but he had a habit in his familiar moments of humming mass-music with a false intonation.

'Ah, Monsieur Dumas,' said the Duke of Orleans, 'what good wind brings you here?'

'My desire that your royal highness should be present at the first representation of *Henri III.*'

'That is impossible,' said the duke, 'for I have to-morrow twenty or thirty people to dine with me.'

'Ah, that is easily arranged,' said the indefatigable Dumas. 'I can delay the commencement of the play for an hour, by an arrangement with the manager, and if your highness can advance your dinner for an hour, my object is gained.'

The duke consented. The proposed arrangement was entered into by the manager of the theatre; and on the evening of the performance, Dumas was congratulated in a letter from the baron with the red nose and the hump shoulder. But after a day or two, the play was forbidden, under the pretext that it was a covert allusion to Charles X. and the Duke of Orleans. However, the prohibition was removed, and the Duke of Orleans, calling Dumas into his box, said:

'You have nearly brought me into a scrape. The king sent for me yesterday, saying I am told there is a young man in your bureaux who has represented me as *Henri III.*, and you as the Duke of Guise.'

'Your highness,' said Dumas, 'could answer that this young man was no longer in your bureaux.'

'No,' said the Duke of Orleans; 'I preferred another answer, for I retain you in my service. "Sire," said I, "you are mistaken; for I do not beat my wife; the Duchess of Orleans is not unfaithful to me, and your majesty has not a more faithful subject than myself." He then added: 'Come to the Palais Royal to-morrow morning; the Duchess of Orleans wishes to see you.' In short, *Henri III.* laid the foundation of Dumas's literary fortunes by a signal success.

Thus launched into the world of Paris society, Dumas became a diner-out of the first lustre, and various lice-hunters sought his acquaintance. One of these was the well-known ex-director, Count Barras, who, after all the moving accidents of the earlier part of his life, saved 200,000 francs a year out of the wreck of his political fortunes, and spent his old age in giving literary dinners. He was a man of old family; and before the great rise of prices in France, this sum enabled him to live in a luxurious manner. Dumas was presented to him by Dr Cabarrus, son of the beautiful Thérèse Cabarrus, subsequently known by the name of Madame Tallien, the belle of the Directorial phase of French society, who married the Prince de Chimay for her third husband. Barras received them in his villa at Chaillot sitting in his arm-chair, which in the last years of his life he never quitted. He was then seventy-four years of age (1829), and a fine-looking old man. He wore a cap on his head, only his face and his hands giving signs of life; for from time to time he fell into a lethargy, as if he were dying. When the hour of dinner came, the folding-doors opened, and Barras was wheeled to his place at table. The dinner was sumptuous; but Barras's only part in the entertainment was to dip his bread in a plate filled with juice of the cuttings of a leg of mutton. This was the extent of his share of the feast.

The Princess de Chimay was of the party, but styled citizenship. Her husband had a familiar valet-de-chambre who stood behind him, and, as in old plays, took part in the conversation, and on one occasion tapped a general on the shoulder with the apostrophe: 'Général, je vous arrête;' and then proceeded, to the utter astonishment of the general, to correct his memory on some revolutionary fact. When Sir Walter Scott was in Paris, Barras wished to see him, and commissioned Dr Cabarrus to invite him to dinner; but Scott shook his head, and answered that in his forthcoming history of Napoleon he intended to take an unfavourable view of the character of Barras; and that if he were to dine with him, and then to abuse him, people would say, when he went back to Scotland, 'that he had thrown the dinner-plates at his head.'

Such as these, we think, present amusing glimpses of the life of a Parisian litterateur; and so we take our leave of Dumas.

ANT GOSSIP.

Long before the real natural history of ants was known, they did duty as models, examples, and illustrations for writers, both sacred and profane: often ignorantly, as in the ancient fable, which represented them as devoted to the science of political economy, and prefiguring the establishment of savings-banks; but always pleasantly—a pleasantness which a truer knowledge of their world and ways only augments and heightens.

Of course, every one knows how ants and bees are taken to represent the two great sects of human politicians; how republicanism is made to find its antitype in the formic community, and monarchy its exemplar in the apiarian kingdom. But concerning this same republicanism, we have a word to say, which perhaps may give a different formula to the

constitution of some of the pismires, and destroy their claim to be considered as belonging to the Rouges. Anyhow, it will be proved that their republicanism, if it exist at all, is of the Spartan and oligarchic character, and the furthest possible removed from any modern notions of socialism.

To begin with: Who, among the Red ants, are those four, or five, or eight, or ten ladies surrounded by guards and courtiers, who all reside together in the same large chamber, for all the world, like an eastern harem, solely occupied with the cares of futurity and the hopes of maternity? Wherever one of these royal ladies turns, she is received with respect and obedience; her guards, or rather her court, leap and dance before her, caressing her with their antennæ, and talking to each other about her by means of the same organs. She is the centre of their world, the cynosure of their regards; and if you separate her from them, they soon form themselves into a dense body and enclose her in the midst. If you take her away altogether, they go mad outright. Their queens had once wings. One fine day they and their mates left the ant-hill, and flew up into the air. The ants—the workers, soldiers, and nurses—all followed them as far as they could, and as long as they remained in the neighbourhood; and even after they had flown off, parties of scouts and guards scoured the country for—to them—miles round, waiting until one or more of the females should alight on the earth again; when, so soon as their feet touched the damp soil, their wings dropped off, and they were thenceforth under the care and jealous homage of the colony. As for the poor winged mates, their business in life was over. They might be entangled in spiders' webs, or fall into the ant-lion's den, or be devoured by huge feathered monsters, or lie on the ground and die of hunger—not an ant of the whole hill would stir an antenna to console or give them a mouthful of food to support them. Their work was done; their day was over; their only business now was to die as quickly as might be, and rid the world of their woes. If the luckier spouse were to die, how different the treatment she would receive! Faithful attendants would lick and brush her lifeless corpse for days and days together; and it would be hard work to console them; impossible, indeed, if there were not others to whom they might transfer their allegiance, and their love. What is all this but a gynocracy which brings to our minds the devotion of the days of chivalry—Lancelot du Lac, and all the rest of them?

Again: that lady and gentleman belonging to the white ants, carefully selected from a crowd of competitors, and kept by the community in the same kind of royal thralldom as the wingless ladies of the Red—also, like them, surrounded by guards and courtiers, and also occupied with the cares of futurity—what are they but elective monarchs, reigning on strictly constitutional principles, under the control and surveillance of their faithful commons? Then the slave-taking expeditions—when an army of Amazon or Legionary ants march out to the encampments of the Negro ants, attack, carry, and sack them, and return to their own city laden with slaves in embryo—what is this but republicanism, according to the charter of Lacedæmon?—indeed, according to the charter of a more modern republic as well, but by no means the ideal commonwealth of utopias or phalansteries. Is not the standing army, too, of some ants an institution anti-republican? and does not the violence and authority of command shown by individuals with more brains than the rest,

to others less intelligent and more wilful, hinge on the great law of rule individual or by caste, which is never found in simple democracies, and always accompanies monarchies and oligarchies? We admit that there are arguments on the other side as well, for tribes and species differ in their national peculiarities. A party of Germans, Italians, Englishmen, and Cherokees are not more different, one from the other, than are the turf-ants and the wood-ants, the red ants and the white ants, the yellow ants and the negro ants, *cum multis aliis*. And though the rough draft of the various governments is much the same for all, yet there is a wide margin left for annotations and 'amendments.'

One of the strangest of the many strange phenomena connected with the ant-world is their battles. Two cities of the Wood ant, if situated within marching-distance of each other, must needs go to war. It is part of their existence. Fine large military roads, 'diverging from the ant-hill like so many rays from a centre,' lead out from and to each encampment. From morning to night, these roads are thickly peopled, apparently without any hostile feeling on the part of either tribe; but suddenly the war-hatchet is unburied, the pipe of peace is smoked out, and our Wood friends mutually arrange their battalions for a regular hand-to-hand fight. They do their work with such fury that the ground is covered with the dead and dying; and so engrossed are they with the sublime duty of stifling with venom or mutilating and devouring each other, that they pay no attention even to a human foot, which may come down on the wings and outposts of their armies, and scrunch the warriors' bones beneath its tread. All the time of the battle, the civic business of the two colonies goes on undisturbed; and after the fight has lasted for a certain number of days, the war-hatchet is once more buried, the warriors cease to frequent the roads that lead to the hostile encampment, and the quiet of the city is undisturbed on the right hand and on the left.

But the ant-battles are not always between two rival camps of the same tribe, nor yet always undertaken for prey and plunder when between different tribes. Sometimes two armies of different species will fight from no other apparent cause than the love of fighting. Thus, the Herculean ant, nearly half an inch long—not known in England—and the Sanguine ant, only half its size, were watched by Huber in a deadly affray, all for no visible end. The Herculeans quitted the trunk of a tree where they had lodged themselves, and marched up to the very gates of the Sanguine city. The besieged acted on the defensive, and suffered themselves to be slaughtered without mercy. After the first brush, and while the Herculeans were taking breath, they transported all their valuables, eggs, grubs, pupæ, queens, &c., to a distance of fifty feet, under cover of outposts, placed at intervals, both to guard their retreat, and to ward off any sudden attack on the city itself. And when all was completed, the return-blow was struck, in which the Herculeans had the worst of it, as they deserved. The small Sanguine might often have been overpowered by the superior weight and size of its antagonist, had not its brethren in arms come to its assistance; and amongst them all, the formic Heracleidan either perished on the battle-field, or was conducted prisoner to the camp, there to be put to a cruel death. The Sanguine had the advantage in numbers, and numbers overcame strength.

The Sanguines are among the slaveholding populations, and harry and worry the poor Negro ants out of their existence, whenever they have the chance. The Negroes resist as long as they are able; but when they have fairly lost the field, they carry off as many of their pupæ and young females as they can; some even—more courageous than our stoutest heroes—will return alone, through the very thick of the

sacking army, down to the chambers where lie the unconscious grubs and eggs, and endeavour to rescue one or more from the mandibles of the enemy. In the very beginning of the fray, they had placed as many of their treasures as they could carry in comparative safety on the covered side of the hill. Those are the treasures they are carrying off now in full and rapid retreat, the Sanguine wretches chasing them virulently. The poor Negroes take kindly enough to servitude; and when their masters return home after a foray, bringing fresh prisoners even of their own tribe, they will caress and offer the robbers food, with an utter obliviousness of patriotism, and a sad facility of chain-bearing. But it must be remembered, in mitigation of our contempt, that adult Negroes are never captured: the slave-owners are too wise for that. They take them young, indeed before they are born, and so secure themselves against inconvenient reminiscences. The Negroes are the workers, the squaws, the hewers of wood and drawers of water, the nurses and factotums of their warrior-masters; while these huge, awkward, feckless fellows, sit at the bottom of their city waiting until another spell of soldiering calls them forth. Why, they cannot even feed themselves! The Negroes have actually to feed them; and as for taking care of their eggs or grubs, or building anything like a shelter for them or for themselves, they have about as much idea of that as a new-born baby! In one experiment that was made, when warriors, pupæ, and larvae were all thrown together into a box, where there was both earth to build with, and honey to eat, the huge helpless men-of-war roamed about and about in a wild distracted sort of way, looked at their grubs, and evidently did not know what to do with them, though all their materials were at hand. They died, some of these great creatures, and would soon have all perished in the very lap of plenty, had not the experimenter let in one tidy, industrious, canny little Negro; and this creature, alone and unassisted, built cells for the young, fed the gasping warriors, arranged and smoothed and fashioned all into order, just like a dear little Ruth Pinch as she was, in the midst of a set of awkward helpless giants. The Negroes build the city, feed the warrior-citizens, nurse the grubs, whether warrior-grubs or Negro; in short, do all the loving, careful, and intelligent work of the community, and are faithful and devoted to the death; but, like all indispensable and spoiled servants, they are dictatorial. They will not allow one of their robber-masters to leave the city alone, nor before the proper time of bloodshed and rapine has arrived; and if they return from a raid without the expected lift, the Negroes give them the cold shoulder; and, if very incensed, will not allow them to enter the city at all. If they dare to enter, dogged and sulky, the little Negroes drag them out again with a lantern that sends the crest-fallen bucaniers a-soldiering again, by their leave or without it.

Some ants keep not only Negroes, but also the eggs of the aphids, their cow, of which they take jealous and incessant care. Every one knows how an ant treats an aphid; how it goes sidling up to the fat quiet thing, and caresses her with its antennæ, till cowed, in a fit of gratitude and pleasure, gives out her drop of honey-dew, which pismire laps up—ants lap when they drink, something like a cat—then strolls off to milk another aphid-cow by the like means. But every one does not know that ants wrestle and play together, like a couple of boys let loose from school. Huber found out that fact, as indeed he found out most of the secrets of the ant-hill. He went one day to his formicary of wood-ants, and saw at a glance that no work was being done that day; but he saw also that they were all in a state of extraordinary excitement. A little attention shewed him his ants dancing on their hind-legs, patting each other with their antennæ, in evident invitation to come out boys and girls to

play, and playing, by seizing each other by a mandible, foot, or antenna; then wrestling with might and main, turning, closing again, hiding from each other, finding each other again; sometimes, when one was victor undoubtedly, he would attack many others in succession, overthrowing them all like nine-pins. Sometimes, too, especially the hill-ants, they amuse themselves by carrying each other pickaback, or in their mouths, as cats carry their kittens, or dogs their puppies. On graver occasions, as, for instance, if their pupæ and grubs are buried under the ruins of their invaded city, they may be seen digging them out from the wreck, and carrying them off, like the old St Bernard dogs in the pictures, all snow and babies.

But our European ants are mere nobodies compared to the great white ant of India, that terrible fellow who will eat away the legs of your table in a night, and leave you only the simulacrum of a table, a superficial outside, a mere sham, as you find to your cost if you put anything on the top. The white ant lives chiefly on wood. He will excavate a tree, living or dead, a post, a table, a book-case, a cask of wine—and let all the wine out—the beams of a house; anything, in short, made of wood, will he gnaw his way into, leaving the outside intact, so that it is only by a luckless experiment that his depredations are found out. If he eats away the supporting beams, however, of a ceiling, or of anything which, that support being withdrawn, would fall and crush him on the spot, he ingeniously repairs his damage with a kind of cement he makes out of clay and earth; so that he literally turns wooden pillars into stone, filling in with cement all he destroys in wood. They make enormous nests five or six feet high; these nests, when only half finished, are strong enough to serve as stations for the wild bulls, the leaders of the herd, from whence they can better see their subjects feeding in the plain below. The Indians eat the white ants, and uncommonly good eating they are reported to be. One gastronome said that they were like sugared marrow; another, like sugared cream and sweet almonds—similes very exciting to one's organ of gustativeness. The white ants hoard up large magazines of tree-gums for their queens and their young to eat—gums of every shade of colour and of every variety. Some white ants build their nests something like tool-stools—these are called turret-building; others build in trees; but the generality make their hill-nests, as we stated above, and construct covered-ways to wherever they want to go. So jealous are they of being seen, so modest, too, in their rapaciousness, that they will not eat in sight of day, but must needs be walled and vaulted in, like novices or odalisques. They are monstrously unpleasant neighbours—as bad as to remove or a fire for one's furniture. The carpenters are also exceedingly jealous of observation. They live in trees, and will not stay to be studied, not though bribes of honey or sugar be placed before their very mouths. The jet-ant is the most renowned of the carpenters; he dyes all his wood jet black, and makes a very dingy-looking city. But his carving is singularly delicate; and he constructs columns and arches, galleries, halls, and vestibules, like the best trained architect in London. The mason-ant understands the principle of the arch, as the bees know the value of the hexagonal cell. He can balance his girders and blocks without cement, so as to form a perfect vault, fashioned on correct mathematical principles.

O the grand, the interesting world that lies at our feet, and skims above our heads! O the wisdom, the intelligence, the beauty and the power, shewn in the despised insect-races, which half the world crush under their feet, or brush shudderingly away! We know of no study more full of boundless interest than the study of entomology, than the reading, in small type, the words of eternal beauty, love, and wisdom, by which

God made the world—none that we would recommend as a surer heal-all to the heart-sick and the weary, the loveless and the lovely! And the alpha of entomology we hold to be the ant-hill.

THE GHOST-PLAY.

It would almost seem as if every man in the French army was an Alsatian, so frequent is the reply, when you ask a soldier 'from what part of France are you?' 'From Alsace.' The warlike spirit once prevailing in that province may have become second nature to the inhabitants. Being an exposed frontier, it was, in former days, continually attacked by the rivals and enemies of France, and a prey to all the adventurers disabused by belligerent powers; consequently, it was forced to be for ever on the defensive; and apparently not having enough of fighting with foes, the peasants and their lords filled up the intervals of contention with strangers by violent quarrels of their own. We may be sure, when in steaming through the country, a picturesque ruin on an inaccessible height is seen for an instant and lost again, that all between its crumbling walls and the nearest town has been, over and over again, pillaged, ravaged, burnt, and submitted to every kind of violence from the days of Attila to those of Napoleon the Great. Every one of the pretty valleys of the Vosges has been, in its turn, the scene of a desperate battle and a bloody struggle. The amazing part of the story is, that the smallest bit of wall or cement should still remain to remind the antiquarian traveller of what has been; for there is scarcely a woody hill which is not crowned by its castle, and which does not in its depths conceal enormous heaps of ruin, telling of the extent of its dependencies. As certain as you are to see these artistic bits, so sure, also, are you to perceive, immediately beneath feudal towers, the tall chimneys of some powerful manufactory, which now bears sway throughout this commercial district; and marvellous is the size of these intrusive but valuable buildings, with their long ranges of windows, and their immensely lofty walls. They are not at all picturesque, neither are the swarms of work-people, male and female, who pour from out their portals in haste to snatch a rapid meal, and return to their ceaseless occupation. Every hand in every village is employed; and whatever other complaints may be heard, want of occupation is not amongst the grievances. The proprietors of these extensive mills and manufactories are men of immense wealth; but those whose work has made them so are about as miserable, savage, and uncomfortable a looking race as one could meet. A sentimental or philosophic traveller, perceiving this, might be induced to ask the difference between the lot of the peasant, whose existence is given up to the lord of the mills of the present day, and that of the vassal whose life was devoted to the lord of yonder castle some centuries ago. Perhaps the tyrant of those towers was forced to live on his estates; but certain it is that the rich proprietor now-a-days is spending his money, gained in these valleys, in some luxurious city far away, never visiting his 'native vales' except to assure himself that the grinding of gold is prosperously going on. Not content with usurping the sites of old castles, many of the manufactories are actually wedged into the indestructible walls, effacing them with newness and completeness. They say to the strongholds of the Lothaires and Childeberts: 'Our turn is come;' and exulting wreaths of black smoke are sent sailing from huge chimneys, from the vales to the mountains, and far over the still crowding forests. The Roman conquerors, who made *stations* once upon a time along the line of road from Strasbourg to Basel, little contemplated the sort of stations which the railway has now strewn upon their traces.

Where once stood the strongly defended monastery of Koenigshoffen, and its protecting neighbours of Geispolzhelm and Ostwald, the whole site is now occupied by a colony established by the benevolent mayor of Strasbourg, M. Schlutzenberger, who, determined to utilise the very worst materials, and give a chance to the least respectable of the inhabitants of his magnificent city, has carried out his noble scheme of reformation, and has the triumph of finding his exertions entirely successful. Part of the forest which covers the range of hills was cleared, air and light were let into the landscape, the ground was drained and cultivated, and at this moment a productive district has taken the place of a mere desert. The peace and comfort now to be found in the colony of Ostwald are probably appreciated by the families of former pickpockets and housebreakers, who consented to try the experiment of the policy of honesty; for nothing can appear more respectable or well-to-do than those who carry on their occupations in the locality.

The plain at the foot of the hill, where cottages are beginning to group themselves, is the site of a desperate battle between Marlborough and Turenne; but the names of both those redoubted generals are forgotten in that of the sensible and judicious mayor of Strasbourg.

The good king Dagobert, if his spirit were permitted to revisit the spots in which he formerly delighted, would certainly be startled at the change in his monastic village of Geispolzhelm, where, if he got out of the train bodily, he would lose himself in endeavouring to find his monks; and in equal amazement would the ghost of Charlemagne be, should he seek at the next station for his beloved city of Rosheim, for he would recognise little there but the beautiful tower of the church he built for his lieges. Nothing can be prettier than the position of this charming village of Rosheim, nestled at the foot of a high hill, on the summit of which stand the fine ruins of the Castle of Guirbaden. No doubt, by the name of it, there were always baths here. There is a very fine bathing establishment now, probably on the same spot where Charlemagne indulged in the luxury. It is quite worth while for a traveller, who is not in a hurry, to stop at the station and give an afternoon to the ruins, or rather to the delicious walk to them, which will repay him at every step by the fine views it gives over a most remarkable country of gorges and ravines, meandering rivers and thick woods, and chains of mountains stretching into mazy distances; to every one of whose subject heights attaches some legend, reviving the poetical climber whose breath begins to fail him, and who will always gain by packing up a little romantic lore in his head, as well as sandwiches in his basket, before he sets out on any excursion in a wild country like Alsace; for, after all, huge manufactories and gigantic chimneys, when often repeated, become as monotonous as stories of castles and of giants; therefore, it is not amiss to make sandwiches of the two classes of interest, and take them by turns during the journey.

To this Castle of Guirbaden attaches a very wild story, quite suited to the scene. It seems that in the seventeenth century, while fierce war was carried on between the Alsatians and Lorrainers, the castle was betrayed into the hands of the latter by a perfidious servant of the Countess of Guirbaden. Every year, since that time, on the anniversary of the fair of Haslach—the village at the foot of the hill—a sort of expiatory ghost-play is acted in the castle ruins, which lasts a whole week. The *dramatis personæ* are the countess, the governor, the false vassal, and the men-at-arms concerned in the defence of the stronghold, and the drama is as follows: At midnight, the governor rises from his tomb in the vaults, and hurries from gallery to gallery, summoning, in a hoarse and solemn voice, his garrison to be on the alert, and arise for

vengeance. Four of these descend the stone stairs of the great tower to a vault so deeply concealed that no human eye can now discover it. Here they take up the coffin of the countess, and bear it to the great hall. They then, together with the rest of the men-at-arms and servants, arrange themselves round it in awful silence. The governor takes his seat near; he is habited in a robe without sleeves; and the cavities where his eyes should be are filled with blood. This is in memory of tortures he underwent from the Lorrainers to induce him to discover where the treasure of the countess was hidden. The traitor who betrayed the castle is then introduced, and his trial begins. He is dressed in red, and holds in his hands the huge key of the postern-gate by which he admitted the enemy. He appears to be overwhelmed with remorse and fear, and stammers forth excuses, and pleads for pardon for some moments, no interruption being offered; but when a quarter to two strikes from an invisible clock, the judges proceed to the vote, and after a period of deliberation, the governor slowly approaches the coffin of the countess, and appears to consult his dead mistress. Presently a harsh voice proceeds from the corpse; and the words 'Let him be delivered to justice' resound through the hall. This occurs exactly at the moment the bell is striking two, and at the same instant begins a terrible chase, of which the wretched culprit is the object. He utters the most piercing shrieks as he darts from the spot pursued by the governor and all his attendants. The latter rush to the outward walls of the castle, and there, taking each other's hands, they form a circle, in which they whirl madly round, hemming in the terrified criminal, accompanying their wild dance by hideous howlings and execrations, all the time the great bell of the castle tolling as loudly as if it still hung in the empty belfry, through which the stars glimmer. This commotion lasts till four o'clock, when, at the last stroke of the hour, the whole phantom-crowd suddenly disappears, everything returns to silence and repose, and the drama is ended for that night, to be repeated nightly till the week is finished, and the castle is restored to the moon and the owls for another year.

The owl, indeed, had a good deal to do with this Castle of Guirbaden, which, in times more recent than those when the real tragedy was acted which this ghost-play shadows forth, was a place of much revelry and hilarity. The guest was received by the lord of the castle with cordiality, conducted into a state-apartment, and there crowned with a certain beaver-hat, which it was his privilege to wear all the time he remained. After this, he was invited and expected to drink to the last drop the contents of a huge cup, made in the form of an owl, in honour of his entertainer; and according as he succeeded with facility or otherwise, rose his fame amongst the jovial company of the Castle of Guirbaden.

PREVENTION OF CASUALTIES ON GOODWIN SANDS.

Along the narrowest part of the English Channel, off the Kentish coast, is a quicksand about twenty miles long, and several miles broad. On the edge of this abyss, at long intervals, are some scattered lights; but, during hazy weather, confounded with numerous other beacons, these are worse than useless, while in storms they disappear altogether. This abyss is the famous Goodwin, where some noble ship, with her whole crew, is every now and then engulfed. A more efficient, but very simple protection has been devised by Mr George Chown; consisting of a double line of buoys, each furnished with a large sonorous bell, placed round the entire area, the outer line two miles from the quicksand; the inner, a quarter of a mile nearer; and the buoys 100 yards apart. On the coast-side, one line would suffice, with the buoys 300 yards apart. In stormy weather, the bells would be set in

motion by the sea; and in an absolute calm, so far as steamers are concerned, the paddles would serve to draw forth the warning voice.

EN AVANT!

HEAVY and thick the atmosphere,
The prospect narrow, dark, severe—
Yet a few steps the path is clear,
For those few steps, march on!

Dark rocks that frown as if in wrath,
Like giants ranged across the path—
Be sure the gorge some outlet hath,
So trustfully march on!

A deep wide stream that shines like glass,
Flanked by steep banks of slippery grass—
There is some bridge by which to pass,
So watchfully march on!

A tempest rattling in the wind,
The sun in thunder-robcs enshrined—
Doubt not some shelter soon to find,
Still hopefully march on!

The day goes out—the fog upcrows,
Darkness the face of heaven enshrouds—
A voice shall guide thee through the clouds,
So patiently march on!

If Duty set you on the way,
You need not fear—you must not stay;
Still faithfully her word obey,
Still loyally march on!

Let but your aims be high and true,
Your spirit firm, but patient too,
A Titan's strength shall go with you,
Still fearlessly march on!

M. H.

'CAPTAIN DODD AT SEA.'

Since the article under this title in No. 173 was printed the writer's attention has been drawn to certain documents contained in the appendix to Señor Navarrete's *History of the Four Voyages of Columbus*, and which are vouched by the historian to be authentic extracts from the series of Spanish records preserved at Simancas. They narrate that, in the months of May and June 1543, Blas de Garay, a naval captain in the service of the Emperor Charles V., conducted at Barcelona a series of experiments upon the applicability to ships of a certain repulsive force which he alleged himself to have discovered; that the mechanism which he employed consisted of wheels, one attached to either extremity of a horizontal axis which traversed the vessel's waist, and was commoved in a peculiar manner with a large caldron of boiling water; that the experiments were conducted in the presence of several persons of high birth deputed by the emperor to witness them, of many naval commanders, and of 'a crowd of curious persons capable of appreciating the discovery;' that on the seventeenth of the above month of June, De Garay succeeded in taking to sea a vessel of two hundred tons burden; that she was propelled neither by sail nor oar; and that her rate of progress was about a league an hour. On the authenticity of the documents, strong doubts were cast by the late M. Anquetin in the *Annuaire du Bureau des Longitudes* for 1844. Whether it was ever successfully vindicated, the present writer has been unable to learn: but if the documents are genuine, as, from Señor Navarrete's character, it is improbable, there can be no doubt that De Garay actually solved an important physical problem, and that the first to venture to sea in a ship propelled by the agency of steam.

DESIGNERS' ATELIERS IN PARIS.

THERE is hardly a phase of Paris-life—social, political, industrial, artistic, fashionable, or gastronomic—which is not familiar to general readers. All its picturesque cluster of social grades, from the faded régime that lingers in the Faubourg St Germain, to the chiffonnier population that studs the sloping pavement of the Mont Ste. Geneviève, have been sketched, caricatured, and moralised upon, in every possible aspect. Events, some of them gloomy, some pleasant, have familiarised that class of slippered and fireside travellers, who, as Cowper says, 'run the great circle, and are still at home,' with most of the celebrated spots and edifices of this beautiful city. Notre Dame and the Madeline are as well known to most of them as the cathedrals of Lincoln and Durham, or as the streets and squares of the nearest county town. The double belt of Boulevards, the Champs Elysée—with palaces and the noblest square in Europe at one end, crowned at the other with the Arc de Triomphe and 'Gate of the Star'—create no stranger feeling than affects itself with the mention of Rotten Row or the green slopes of Kensington. Amongst numerous word-pictures, however, of the different industrial classes of Paris, we do not remember to have seen any detailed reference to the designers for textile fabrics—a class of workmen-artists who help very materially to sustain the reputation of this city in all that relates to taste, purity, and fashion. Under the present imperial sway, directed by a lady whose beauty loses nothing in comparison with that of a Josephine or Marie Antoinette, this does not seem likely to resign its long-standing privilege as the dispenser of fashions. Paradoxical as it seems, amidst all other changes, Paris, in its most beautiful character, remains unchanged. The repeated storms of revolution that have cleared away dynasties and time-honoured institutions, have left untouched the subtle despotism—*le tyran des femmes et des fûts*—which yet dictates to every corner of civilised Europe the mode of ribbons, patterns, feathers, and flounces. The same source from which, during the reign of Louis Quatorze, we were supplied with patches, periwigs, and poetry, still furnishes our manufacturers with heights, and our metropolitan theatres with farces. Legends have been shivered and thrones shattered, but the wand of fashion's 'fickle queen' is as potent as ever, most honoured when most capricious, most despised when most ridiculous. There she continues to sit in undisputed honour, 'with quips and cranks and wreathed smiles,' fearless of powers either monarchial, republican, or imperial; with the fragments of countless and once-worshipped fancies scattered at

her feet, thick as autumnal leaves that strew the brooks of Vallombrosa.

Few better illustrations can be supplied of this state of things than those to which we are about to refer. The Parisian establishments for industrial design—those at least in connection with the printing of textile fabrics—are principally supported by their transactions with English manufacturers. After all the encouragement which has been given to the introduction and establishment of schools of design in our country, with a view to raising up a superior class of native workmen, English printers continue dependent upon foreign skill, and the trade in France for the exportation of Parisian designs is manifestly flourishing and increasing. Several new ateliers have sprung up very recently, chiefly dependent upon that miracle-working agency, British capital. The continuance of such a system is, of course, variously accounted for; some asserting that our art-education, as applied to manufactures, has not yet had time to display its results; others, that the too direct and meddlesome interference of the potentates of Marlborough House with trade interests, has tended to retard the bud it should have more gently helped into flower; whilst another party of tolerably resigned temperament, accepts the fact of our obligations to French taste and invention as neither disennobling nor humiliating, inasmuch as it is supposed to represent a feature of that mutual national dependence which knits together the different parts of modern civilisation.

Be this as it may, the birds of passage are not more punctual in their migrations than English and Scotch printers in their perennial pilgrimages to the shrine of fashion. The agreeable relaxation from the dull routine of commercial life which such a custom affords, thus combining both pleasure and profit, contributes no doubt to its perpetuation. As the spring or autumnal season approaches, a few of the bolder and more adventurous leaders of the trade give the first signals of departure; the reward of whose more forward and speculative spirit consists in catching the budding novelty—the 'feeling' of the season—in all its virgin freshness, ere it has become multiplied in a thousand inferior ways, and whilst it possesses all the nascent bloom and attractiveness which belongs to an unhackneyed fashion. In the wake of these, come the timid and numerous progeny that exist and flourish upon the second-hand and half-exhausted fancies of the more courageous magnates of the market; and yet, wonderful indeed is the extent to which the individuals of this class push their claims to all the honours and merits of invention and originality. But the most pitiful era in the onward and downward history of the

characteristic ideas of any particular season, is when they fall into the hands of the 'low-priced men' and 'jobbers.' These men are content to possess themselves in patience at home, till web and woof, and block and cylinder, have brought the hard-won novelty—upon the original production of which so much wit and money have been expended—into the form of merchandise, already started upon its long journey to remote quarters of the globe. Then commences their unenviable, though often money-making vocation. Pityable are the transformations which many good things are destined to undergo when they reach such ruthless hands! The eagerness of these individuals to popularise and cheapen the ideas and labours of others, is as amazing as it is unconscientious. If some aspiring 'high-art' printer were to bring out the cartoons of Raphael at 6d. per yard, we have not the least doubt that one or more of this forward race would rest neither day nor night till they had transferred the designs to inferior cloth, and 'put you them in' at 3d. Some slight alteration of course would be made, sufficient to escape the mere letter of the law, and render the genius of the 'great master' still more questionable than has been already done by the criticisms of Ruskin. With this brief tribute to such merits, *revenons à nos moutons*.

Several of the leading design-ateliers in Paris consist of from forty to fifty workmen, though they generally dwindle down to about half the number during the *morte saisons*. These occur towards the end of the two annual seasons, after the demand for the light or dark styles has been nearly exhausted. To those designers who are in employment, the *morte saison* is frequently a time of wearisome attempts at creating, anticipating, and guessing the taste of the next busy period. No farmer feels greater anxiety at the approach of seed-time or harvest—no philosopher is more bewildered in attempting to predict from the 'signs of the times'—no premier is more 'at sea' during a recess, than these caterers to novelty when the fashions are in a kind of transitional or chrysaline stage. There is more order and sequence, however, in the successions of the styles associated with textile fabrics, than some grave people imagine: of this philosophy, the French designers are remarkably cognizant; though the practical application of it during such times as those we have referred to, is attended with an unknown degree of uncertainty and embarrassment.

The hours of labour to which these workmen are accustomed are somewhat long, considering the artistic and sedentary character of their occupations, which may very fairly be said to be of those

Which waste the marrow and consume the brain.

In this respect, they are much less favoured than the designers employed in the print firms of Manchester and Glasgow. The ordinary hours of the French designers, in such establishments as are under our notice—very few of this class in Paris being in the exclusive employ of the printers—are from seven A.M. to six P.M.; though very often, when crowds of English customers are in Paris, waiting to return home with the products of Parisian skill, these workmen toil on, hand and brain, for weeks together, till late every night, and, under such circumstances, generally over a portion of the Sunday. Their intensity and capacity for close application, would be thought incredible by those who only know the French as they have seen them strolling along the Boulevard des Italiens or the Champs Elysées; who measure their endurance by the patience and good-manners they display in waiting at the doors of a theatre, or the untiring energy they devote to the mad frolics of a *bal masqué* at the Opéra Comique.

We have seen a great amount of exaggeration and misstatement respecting the remuneration of French designers. Since manufacturers, instead of employing a staff of designers, each according to his requirements,

have begun to depend upon large ateliers for their supply of designs, the rate of wages has gradually sunk. A *chef d'atelier* may occasionally receive six or seven thousand francs per annum, though an ordinary workman would consider himself handsomely remunerated at half such a sum.

The facilities which Paris offers to the attainment of varied excellence in design, and the temptations it offers in so many other respects, help to give a very motley aspect to the groups that compose these workshops. In the national, provincial, and individual varieties of which they are made up, they present faithful epitomes of the similarly diversified world of Paris itself. The principal supply of workmen is from the city and surrounding district of Mülhausen, in Upper Alsace, where the printing of textile fabrics—excluding silks—is carried on to a greater extent and to greater perfection than in any other part of France. Here they become acquainted with the practical operations and executive conditions of their art, a thorough knowledge of which is as necessary to the industrial designer as artistic excellence and taste. Though exceedingly skillful in all that directly relates to their business, these Alsacians are not remarkable either for intelligence or refinement. Situated on the borders of two great empires, and ceded to France only near the commencement of the present century, Alsace possesses neither the nationality nor the language of either its former or present rulers. Its inhabitants speak a German that would be as useless as Greek to a Berliner, and a French that is a sore riddle to Parisians. Switzerland also supplies its quota to these ateliers, of whom we may just as well observe, that they generally seem to manifest a much heartier love of the 'beauties of nature' which are to be found within the Parisian frontier, than ever they entertained for the lakes and mountains of their native land. Besides these, there are a few Frenchmen from different provinces, a sprinkling of Germans, Dutch, Flemings, seldom more than one or two Parisians, and perhaps a solitary Englishman. After this general introduction, we may set the reader at once in the midst of one of these singularly miscellaneous laboratories of design.

There is a young fellow in a colour-besmeared blouse, and a pointed imperial and beard—indicative, we suppose, of a certain political school—aggressively defending some suspected policy of Girardin against the insinuations of an opposite party; and yet, amid argument and sarcasm, the rich and elaborate cashmere upon which he is engaged keeps growing more finished and beautiful; colour after colour, and form after form, are being swiftly dashed in, as though there were some latent sympathy between the progressing design and the articles of the 'thunderer' of *La Presse*. Another, busy with the delicate hues and gracefully trailing forms of a composition for mûseline, is at the same time relating some mad freak of the previous night at a cheap masquerade; and yet, here again, the work bells of speakers and listeners goes gaily on. A group of more critical character are commenting upon the last drama of Ponsard, or the last attraction at the Variétés; undisturbed by the proximity of a few old shopmates, who, amidst mingled humming and whistling, are trying to make out some half-remembered air from *Il Trovatore*. Two or three, whose phlegmatic aspects betray their nationality, are indulging in old vocal reminiscences of Vaderland; and, as though there should be some proof that fog-land as well as clodd-land is duly represented here, another workman who stammers out his French with a genuine British accent, is boldly denying the assertion of a haw-worshipping Parisian that Hudson Lowe had expounded *notre grand homme*. Working away in silence—almost the only one who is doing so—we note a middle-aged individual, of a rather saddened and thoughtful look.

His history is not a cheerful, though a common one. In his youth, he dreamed of becoming a great artist; later, spent many years at Rome, Florence, Venice; returned to France, failed in his endeavours, met poverty face to face, and here he is, perpetrating silly fancies for a Manchester calico-printer, instead of embodying immortal imaginations on canvas! Another characteristic personage ought scarcely to be passed over—an unshaven fellow in a coarse blue blouse, who is grinding away on a large glass slab at a mass of ultramarine, an operation which he considers settles his claim to be ranked with *messieurs les artistes*. In literal truth, however, he is simply *garçon* of the establishment, to the duties of which humble position he gratuitously adds those of chief jester. On gastronomic themes he is almost as eloquent as the writer of the celebrated essay on *Roast Pig*, to credit which, it is only necessary to hear him expatiate upon the flavour of some smoked ham, which he managed to convey to Mont Parnasse from the cellars of the royal palace, just after the 'citizen king' had taken *French leave*. Unpatriotic gourmand!

The foregoing sketch—true to facts so far as it extends—may afford some idea of the confused confux of national and provincial peculiarities, sentiments, creeds, and opinions which frequently characterise the design-steliers of Paris. The discordant *tapage* of dialects and jargons in which all this material seeks and finds utterance, is certainly more embarrassing than auxiliary to a novice in the French language. Fortunately, in this respect at least, the writer—who was a practical designer in one of these ateliers for a long period—sat next to a young Parisian. Here, at least, was some chance of getting to hear a little undisturbed French. But our *voisin*, though beardless, was deep in socialism; and would have babbled all day long in defence and explanation of phalansterianism, Fourierism, and other ingenious systems, had we not hinted to him now and then, as gently as possible, that he was a thorough 'bore.' Whether in silence, however, or noisy confusion—the latter seems to act as a stimulus rather than a hindrance—the varied kinds of design upon which these workmen are engaged are actively, steadily, and earnestly going on; novelties are being generated in swift succession; the tastes of civilised and uncivilised peoples, from the Seine to the Ganges, from St Petersburg to the Brazils, are being thoroughly and cleverly catered to. Nowhere do workmen go through their appointed labour with more cheerfulness and good-will, or with more ease and ready manipulative skill. The facility with which they pass from one class of tastes to another is really surprising. At one time they will dash off a design which, for gaudiness of colour and uncouthness of form, is precisely calculated to throw the veriest 'Villikins and his Dinah' into raptures; and then immediately proceed to the execution of another, in every respect so entirely the reverse, that the most fastidious British matron could take no exception to it.

It is not within our present purpose to enter into any detailed description of the work in which French designers are engaged, and in which they so undeniably excel; but a few observations upon the character of industrial design in general, as relating to one of the principal branches of our commercial enterprise, may not be uninteresting.

To make anything like a classification of the styles associated with designing for printed fabrics, would be a task from which a Linnaeus might shrink. We may count upon our finger-ends all the recognised 'orders' of architecture; but it would be a far more intricate task to number all the orders and dis-orders of modern garment-printing. Look patiently at a few of the displays of some of the principal drapery establishments in St Paul's Church-yard, or Oxford Street; and you will soon find that the home-trade patterns

and styles, for a single season only, are bewildering both in number and character. Twenty millions of pieces, it has been estimated, are printed annually in Great Britain; scarcely a fourth, however, of this vast quantity are required for home consumption. 'What a vast commercial supply!' some one may exclaim; 'what important applications of art and science! what a prodigious outlay both of money, wit, and labour, merely to cater to caprice!' And yet, the first mechanicians and chemists of England and the continent have been proud to contribute to the perfection of calico-printing. No branch of trade has availed itself to a more varied extent of the rapid progress of science. Many can easily remember when a pattern of two or three colours was printed slowly by hand, with wooden blocks, and sold at 3s. *per yard*; now, a pattern of a much more complicated character, and far more beautiful both in design and execution, is thrown off at the rate of a mile of calico in an hour, and sold at—3s. *per dress*! To return: different nations have tastes as widely differing from each other as their laws, creeds, or climate. An acquaintance with the history of the styles executed in a single Parisian atelier, would afford a very fair index of the stationary, progressive, or changing character of the countries for which they are intended. Most of those exported—that is, in the form of printed goods—to China, some parts of British India, South America, and many other remote quarters of the globe, have scarcely undergone any change or modification since the time when the ancestors of the present Sir Robert Peel conducted one of the first print-works introduced into North Lancashire. A new combination of forms or colours, or a new class of designs, would be as great a shock to the conservatism of the Chinese, as an attempt to prevail upon them to adopt household suffrage.

The most striking modifications and improvements in these respects, in connection with any of the places to which printed fabrics are exported, are to be found in the states and countries supplied through the Levantine market. The old yellow-ground and fantastic cashmere forms—far inferior to, though no doubt borrowed from the cashmeres of India—which not long ago constituted the only style patronised in this market, now hold company with many others of a totally different class—some of them such as are successful to a great extent in the English home-trade. The most complete manifestation, however, of these tendencies is to be found among the less passive nations of Western Europe and the Anglo-Saxon populations of North America. Here, society is undergoing continual transformations, submitting itself to new influences, casting off old tastes and preferences, or, rather, never allowing any to become old. Change is sought, novelty demanded, not because they always involve progression, but simply for their own sake. Fashion, indeed, is one of the truest characteristics of modern civilisation—an unquestionable result, though a questionable auxiliary. It acknowledges no authority itself, though it obtains unconditional allegiance. In the very heart and centre of the most refined and intelligent communities, it plays its least pardonable freaks, and passes from caprice to caprice with a most abandoned and unshackled disregard of the criticism to which it may be subjected. We will close this article by noticing one of the absurdities which it sanctioned in reference to printed fabrics, though instances far more striking, perhaps, might be brought forward from other departments over which fashion exercises an equally powerful influence.

Indeed, it would be a harder task than some lords of creation think, to tell where this influence is not exercised. We have a theory—a crotchet, if you will—not to be entered into at present, which inclines us to believe that fashion has about as much to do with the

last new novel from Mudie's, be it romance, history, poetry, criticism, or even metaphysics, as with the last new robe from Madame de —, though it be *le jupon à tube d'air*. To our story, however. A few seasons ago, a great novelty, or what was considered such, appeared in the French furniture and paper-hangings. It consisted in the introduction of landscape forms and effects, generally in large isolated masses, which, repeating along the piece at regular intervals, presented the appearance of so many islands—in fact, a complete archipelago. Without any consideration of its inappropriateness, and simply for the sake of a little novelty, this idea of 'gems of the sea' was applied to garments, under the fascinating title—in which matters the Parisians are thorough adepts—of *Les Isles d'Amour*. Dresses of every variety of material were to be seen dotted over with trees, lakes, valleys, and mountains, which—excepting of course the fair wearers—were pitifully unbewitching to behold. Sometimes the fancy of the designer led him to depict various little Arcadian scenes and hypothetical Edens, where there was no end of terraces, vases of flowers, shady recesses, leafy arches, fountains, *feu d'artifices*, and all the usual elegant prettinesses which complete the Parisian conception of a terrestrial paradise. The huddled, jostled, and broken appearance which such compositions presented when seen, not on a flat surface, but in the changing folds of a dress with two or three flounces, was more than a weak vision could long sustain without feeling as though *terra firma* was becoming unusually insecure. A little later on, this extravagance was brought to a close by a peroration, which, however it may claim to have been suggested by patriotic feelings, was an equal burlesque of taste. Shawls were selected as the medium of this grand *finale*. Over their broad surfaces—which undoubtedly admitted of a more comprehensible display—were scattered faithful delineations of various edifices, citadels, and strongholds of war, but more particularly of Russian fortresses. Of these latter, a facetious contemporary observed, that they were not only 'taken,' but 'walked off' with in a style that must vastly have humiliated our then brave defenders in the east. In justice, we ought to state that, except in paper-hangings, to which such applications were most suited, these ludicrous manifestations of taste were not transferred to this country.

THE GREAT MR WICKHAM.

An intelligent French nobleman, who visited this country at the latter end of the seventeenth century, gives us the following interesting account of a most remarkable impostor, the details of whose achievements, it would appear, came under the narrator's own knowledge. His book of travels was translated into English, and published in 1719 (nearly thirty years subsequent to his sojourn among us); and this work is the more valuable, as a picture of the times, that the translator, John Ozell, also the translator of Rabelais, eulogises the fidelity of his descriptions in the warmest manner—saying: 'Whenever our author mentions things of fact, he doth it with wonderful exactness and knowledge of the truth,' &c.; so that the following extracts may not be considered devoid of interest.

The history is introduced *à propos* of funerals, some of the details respecting which are curious enough to be mentioned here:

There is, it seems, says the author, an act of parliament which ordains that the dead shall be bury'd in a woollen stuff, which they do call flannel, nor is it indeed lawful to use the least needful of thread or silk. [The intention of this act is for the encouragement of woollen manufacture.] The *shift* is always white. To make these is a particular trade, and there be many that

sell nothing else, so that these habits for the dead are always to be had ready made, of what size or price you please, for people of every age and sex. After they have wash'd the body clean and shaved it, they put it on the flannel-shift, which hath commonly sleeves purled at the wrists, and the slit down the breast done finely in the same manner. When that these ornaments are not of woollen lace, they are at least edged, and oftentimes embroidered with black thread. The shift should be a foot longer than the body, that the feet be wrapped in it as in a bag. When they have thus folded the end of this flannel shift, they tie the part that is folded down with a piece of woollen thread, as we do our stockings, so that the end of the garment is done into a kind of a tuft. Upon the head they put a woollen cap, which they fasten with a very broad chin bands; then gloves upon the hands, and a handsome cravat around the neck, and all of woollen. That the body may lie the softer, most do put a layer of bran of four inches thick at the bottom of the coffin. The women wear a peculiar head-dress, with a forehead cloth. The body being thus equipped, it is visited a second time by the authorities, to see that it be bury'd in flannel, and that nothing about it is sown with thread. They let it lay three or four days in this condition. They send the beadle with a list of such friends and relations as they have a mind to invite; and, indeed, the better sort do send printed tickets of invitation, which they leave at their houses. A little before the whole company is set in order for the march, they lay the body in the coffin, upon two stools, in a room, where all that please may go see it; then they do take off the top of the coffin, and remove from the face a little square bit of flannel. . . . The relations and chief mourners are in a chamber apart, with their most intimate friends, and the rest of the guests are dispersed in the several rooms about the house. When that they are ready to set out, they nail up the coffin, and a servant presents the company with sprigs of rosemary; every one takes a sprig, and bears it in his hand along the street, till the body is put into the grave, at which time they do all together throw their sprigs in after it.

Before they set out, and on their return, it is usual to give the guests drink, and much of red and white wine, boiled with sugar and cinnamon. Butler, the keeper of the Crown and Sceptre in St Martins Street, told me himself that there was a tun of red port drank at his wife's burial, besides of mulled white wine. *Note*.—No men ever go to womens funerals, nor the women to mens; so that I find there were none but women at the drinking of Butler's wine. Indeed, such women in England will hold it out with the men, when they have a bottle before them, and also tattle infinitely better than they. . . . Then they return again in the same order that they came, and drink again before they go home. . . . It must be remembered that I always speak of middling people, among whom the customs of a people are most truly to be learned. . . . Among persons of quality, it is customary to embalm the body, and to expose it for more than a fortnight on a bed of state.

Many of the obsolete customs here detailed may be observed in Hogarth's *Harlot's Progress*, the last of the series, where the wretched woman in her coffin is about to be carried to her last resting-place. They are all women who are assembled, the coffin-lid is open, and the face exposed to view. They are drinking, and each has her sprig of rosemary in her hand; and the mortuary head-cloth, described as peculiar to women in the seventeenth century, may be observed on the forehead of Hogarth's corpse.

The article of *funerals*, proceeds our author, puts me in mind of that of the pretended Mr Wickham, who

died at London about six years ago, 1691, and whose history I must give you, by way of digression, believing that it cannot be unpleasant.

A good likely sort of rogue, that had been many years footman to a rich gentleman at Banbury, in Oxfordshire, call'd *Wickham*, came to London, and took him lodgings at a rich bakers over against Arundel Street in the Strand. He asked the baker what countryman he was, who straight reply'd from Banbury; and the rogue resolved to feign to be the great Mr Wickham, was mightily fond of the baker, calling him his countryman, and adding, that since he was of Banbury, he must needs know Mr Wickham. The baker, tho' he had been absent from Banbury fifteen or twenty years, was very glad to hear newes of it, and indeed perfectly overjoyed when he was told that the very man he was talking to was Mr Wickham himself. This produces great respect on the part of the baker, and new condescensions from the sham Wickham; nay, the family must be called up, that Mr Wickham might see them—ay! and they must drink a glass together, and smoake a pipe. The baker did not in the least doubt his having the great Mr Wickham for a lodger; and yet he could not but marvel to see him without a footman or portmante, he therefore makes bold to ask him how a man of his estate came to be so unattended. The rogue, making of a sign to him to speak softly, told him that his servants were in a place where he could find them when he wanted them, but that at present he must be very careful of being known, because he came up to town to arrest a great merchant of London, who owed him much monies, and was just going to break; also, that he did desire to be incognito for feare that he should miss his stroke, and so indeed begged that the baker would not mention his name. Next day, he went abroad to take his measures with a comrade of his own stamp, and it was concluded that this latter should appear as Mr Wickham's servant, and come privily from time to time at night to attend upon his master. That very night he came; and the sham Wickham, looking at his own dirty neckcloth in the glass, was in a great rage at him for letting him be without money, linnen, or ought else by his negligence in not bearing of his box to the waggon in due time, which would cause a delay of more than three days. All this was said that the baker might hear it, who hereupon runs immediately to his drawers, and carries Mr Wickham the best linnen he had, begging him to honor him so much as to wear it, and at the same time lays down fifty guineas upon the table, that he might do him the favor to accept them also. He at first refused, but with much ado was prevailed upon.

As soon as he had got this money, he made up a livery of the same colours as the true Mr Wickham, gave it unto another pretended footman, and also brought a box of goods, as coming from the Banbury waggon. The honest baker, more satisfy'd than ever that he had to do with Mr Wickham, and consequently with one of the richest and noblest gentlemen in the kingdom, made it more and more his business to give him fresh marks of his respect and most zealous affection. To be short, Wickham made shift to milk him of one hundred and fifty guineas (besides the fifty) in a very few days, for which he gave him his note.

It was scarcely three weeks from the beginning of this adventure, all which time he had properly plundered the baker, and no doubt was preparing for some crowning villainy, when this rogue was lording it at a tavern, he was seized with a most serious illness. He got home to bed, where he was waited on by his pretended footman, and again assisted in everything by the good baker, who passed his word to the doctors, apothecaries, and to everybody else: indeed, he was visited by Dr Smith and Dr Lowther, two of the most eminent physicians in London.

Meanwhile, Wickham grew worse and worse, and about the fifth day he was given over.

Wickham heard the newes as tho' he had been the best Christian in the world, and fully prepared for death. He desired a minister might be sent for, and received the communion the same day. Never was there more piety, zeal, or confidence in the merits of Christ. Next day, the danger encreasing very much, the impostor told the baker, who was edified to tears at the condition of his noble friend, that it was not enough to take care of his soul, he ought also to set his worldly affairs in order, and so desired that he might make his will, while he was yet sound of mind. A scrivener, therefore, was immediately sent for, and his will made and signed in all the forms, and before several witnesses. Wickham by this disposed of all his estate, real and personal, jewells, coaches, teams, race-horses of such and such colours [all specified], packs of hounds, ready money, with his house, with all its appurtenances and dependencies to the baker; almost all his linnen to the wife; 500 guineas to the eldest son; 800 to the four daughters; 200 to the parson that had comforted him in his sickness; 200 to each of the doctors; and 100 to the apothecary; 50 guineas and mourning to each of his faithful footmen; 50 to embalm him; 50 for his coffin alone; 200 to hang the house with mourning, and to defray the rest of the charges of interment; 200 guineas for gloves, gold-rings, and scarves and hat-bands; and then such a diamond to such a friend, and such an emerald unto another. Nothing more noble—nothing more generous. All this done, Wickham called the baker to him, loaded him and all his family with benedictions, and presently after my gentleman falls into convulsions and dyes.

The baker at first thought of nothing but of burying him with all the pomp imaginable, according to the will, so he hung all the rooms in his house, the staircase, and the entry with mourning-cloth; he gave orders for the making the clothes, the coffin, the rings, &c.; he sent for the embalmer; in a word, he omitted nothing; and having drained his purse to the last, he was in turn forced to borrow to buy little necessaries for this grand funeral.

Wickham was not to be buried till the fourth day after his death, and everything was, it seems, got ready by the second. The baker had now time to go seek for the lawyer the dead rogue had at the last referred him to, before he put him in the ground; so, after his having reverently put the body into a rich coffin, covered with velvet and huge plates of silver, which, indeed, all the town did afterward flock to see, he went to this lawyer, who was, in fact, really lawyer to the true Mr Wickham, and he was, indeed, strangely surprised to hear of the death of Mr Wickham, whom, it seems, he had heard of but the day before; but we may easily imagine that the poor baker was far more surprised when he found that in all liklyhood he was bit. To conclude, the baker was ere long convinced that the true Mr Wickham was in perfect health, and that the rogue he had taken for him was the most clever consistent villain and compleat hypocrite that ever lived.

Upon this he immediately turned the body out of the rich coffin, which he sold for a third part of what it cost him. It might have fetched more if it had not been made scandalous by the body that had been enclosed in it. All the tradesmen that had been employed towards the burial had compassion on the baker; and, indeed, some took their things again, tho' not without great loss to him. He himself pulled off his fine mourning, and donned again his old mealy coat; and they dug at night a hole in Saint Clements Churchyard, where they did throw in the body with as little of ceremony as possible.

I was an eyewitness of most of the things which I have here related, and I shall leave the reader to make

his own reflections upon them; and I have since been assured, from several hands, that the baker hath since had his great losses pretty well made up to him by the generosity of the true Mr Wickham, for whose sake the honest baker had been so open-hearted.

This curious instance of the ruling passion strong in death is equalled in one of Marryat's novels; where a habitual liar and boaster in his last moments leaves to his friends by will a variety of rich and elegant bequests which had never any existence but in his own imagination. The stage is fertile in instances of a similar power of imagination. It is related of a popular actor of a former day, who was celebrated for his impersonations of George III., that he was on one occasion so carried away with the enthusiasm of his part, as well as with strong drink, that he acknowledged the applause of the audience with his hand to his heart, tears in his eyes, and 'God bless ye!—God bless ye, my children!'

Another actor, at a transpontine theatre, was remarkable for his personification of the first Napoleon; and his resemblance in person to the departed Corsican increased the hearty plaudits with which he was always greeted when he enacted this part. On such nights, he carried the histrionic illusion into which he had worked himself at the foot-lights to the *arrière scène*, and in the green-room he was not to be approached: he was 'gloomy, and grand,' absent, sententious, and curt; he strode up and down, twirling his snuff-box between his fingers, his hands being duly folded Napoleonically behind his back; and thus he remained for an hour or two in a haze of empire and glory.

It is well known that a person feigning madness for a lengthened period may become permanently insane; and on this principle we may account for 'the good likely sort of rogue' who personated 'the great Mr Wickham,' continuing his audacious deception to the very last, and actually dying in the part he had assumed, in the odour of piety and Christian resignation, and in the generous display of the most extraordinary and princely munificence.

A WOMAN'S THOUGHTS ABOUT WOMEN.

SELF-DEPENDENCE.

'If you want a thing done, go yourself; if not, send.'

This pithy axiom, of which most men know the full value, is by no means so well appreciated by women. One of the very last things we learn, often through a course of miserable helplessness, heart-burnings, difficulties, contumelies, and pain, is the lesson, taught to boys from their school-days, of self-dependence.

Its opposite, either plainly or impliedly, has been preached to us all our lives. 'An independent young lady'—'a woman who can take care of herself'—and such-like phrases, have become tacitly suggestive of hoydenishness, coarseness, strong-mindedness, down to the lowest dress of bloomerism, cigarette-smoking, and talking slang.

And there are many good reasons, ingrained in the very tenderest core of woman's nature, why this should be. We are 'the weaker vessel'—whether acknowledging it or not, most of us feel this: it becomes man's duty and delight to shew us honour accordingly. And this honour, dear as it may be to him to give, is still dearer to us to receive.

Dependence is in itself an easy and pleasant thing: dependence upon one we love perhaps the very sweetest thing in the world. To resign one's self totally and contentedly into the hands of another; to have no

longer any need of asserting one's rights or one's personality, knowing that both are as precious to that other as they ever were to ourselves; to cease taking thought about one's self at all, and rest safe, at ease, assured that in great things and small we shall be guided and cherished, guarded and helped—in fact, thoroughly 'taken care of'—how delicious is all this! So delicious, that it seems granted to very few of us, and to fewer still as a permanent condition of being.

Were it our ordinary lot, were every woman living to have either father, brother, or husband, to watch over and protect her, then, indeed, the harsh but salutary doctrine of self-dependence need never be heard of. But it is not so. In spite of the pretty ideals of poets, the easy taking-for-granted truths of anti-woman's-rights educators of female youth, this fact remains patent to any person of common sense and experience, that in the present day, whether voluntarily or not, one-half of our women are *obliged* to take care of themselves—obliged to look solely to themselves for maintenance, position, occupation, amusement, reputation, life.

Of course I refer to the large class for which these thoughts are meant—the single women; who, while most needing the exercise of self-dependence, are usually the very last in whom it is inculcated, or even permitted. From babyhood they are given to understand that helplessness is feminine and beautiful; helpless, —except in certain received forms of manifestation—unwomanly and ugly. The boys may do a thousand things which are 'not proper for little girls.'

And herein, I think, lies the great mistake at the root of most women's education, that the law of their existence is held to be, not right, but 'propriety.' A certain received notion of womanhood, which has descended from certain excellent great-grandmothers, admirable in its way, and suited for some sorts of women, but totally ignoring the fact that each sex is composed of individuals, differing in character almost as much from one another as from the opposite sex—some men being womanish, and some women masculine—and perhaps the finest types of either combining the qualities of both—and that, therefore, to deal justly, there must be set up a standard of abstract right, including manhood and womanhood, and yet superior to either. One of the first of its common laws, or common duties, is this of self-dependence.

We women are, no less than men, each of us a distinct existence. In two out of the three great facts of our life we are certainly independent, and all our life long accountable only, in the highest sense, to our own souls and the Maker of them. Is it natural—is it right even—that we should be expected—and be ready enough, too, for it is much the easiest way—to hang our consciences on duties, actions, opinions, upon some one else—some individual man, or some aggregate of mankind representing society? Is this society to draw up a code of regulations as to what we are to do, and what not? Which latter is supposed to be done for us; if not done, if there happens to be no one to do it, is it to be left undone? And, alack, most frequently whether or not it ought to be, it is.

Every one's experience may furnish dozens of cases of poor women suddenly thrown adrift—widows with families, orphan girls, reduced gentlewomen—clinging helplessly to the skirts of every male relative or friend they have, sinking pitifully year after year, eating the bitter bread of charity, or compelled to bow an unaccustomed pride to hardest humiliations—every one of which might have been spared them by the early practice of self-dependence.

I once heard a lady say—a tenderly sweet and tender-hearted woman—that if her children were

themselves wings, as in these times riches will, she did not know anything in the world that she could turn her hand to, to keep herself from starving. A more pitiable, and, in some sense, humiliating confession, could hardly have been made; yet it is that not of hundreds, but of thousands, in England.

Sometimes exceptions arise: here is one:

Three young women, well educated and refined, were left orphans, their father dying just when his business promised to realise a handsome provision for his family. It was essentially a man's business—in many points of view, decidedly an unpleasant one. Of course, friends thought 'the girls' must give it up, go out as governesses, depend on relatives, or live in what genteel poverty the sale of the good-will might allow. But 'the girls' were wiser. They argued: 'If we had been boys, it would have been all right; we should have carried on the business, and provided for our mother and the whole family. Being women, we'll try it still. It is nothing wrong; it is simply disagreeable. It needs common sense, activity, diligence, and self-dependence. We have all these; and what we have not, we will learn.' So these three elegant and well-informed women laid aside their pretty feminine uselessnesses and pleasant idlenesses, and set to work. Happily, the trade was one that required no personal publicity; but they had to keep the books, manage the stock, choose and superintend fit agents—to do things most difficult, not to say distasteful, to women, and resign enjoyments that, to women of their refinement, must have cost daily self-denial. Yet they did it; they filled their father's place, sustained their delicate mother in ease and luxury, never once compromising their womanhood by their work, but rather ennobling the work by their doing of it.

Another case—different, and yet alike. A young girl, an eldest sister, had to receive for step-mother, a woman who ought never to have been any honest man's wife. Not waiting to be turned out of her father's house, she did a most daring and 'improper' thing—she left it, taking with her the brothers and sisters, whom by this means only she believed she could save from harm. She settled them in a London lodging, and worked for them as a daily governess. 'Heaven helps those who help themselves:' from that day this girl never was dependent upon any human being; while during a long life she has helped and protected more than I could count—pupils and pupils' children, friends and their children, besides brothers and sisters-in-law, nephews and nieces, down to the slenderest tie of blood, or even mere strangers. And yet she has never been anything but a poor governess, always independent, always able to assist others—because she never was and never will be indebted to any one, except for love while she lives, and for a grave when she dies. May she long possess the one and want the other!

And herein is answered the '*cui bono?*' of self-dependence, that its advantages end not with the original possessor. In this much-suffering world, a woman who can take care of herself can always take care of other people. She not only ceases to be an unprotected female, a nuisance, and a drag on society, but her working-value therein is doubled and trebled, and society respects her accordingly. Even her kindly male friends, no longer afraid that when the charm to their vanity of 'being of use to a lady' has died out, they shall be saddled with a perpetual claimant for all manner of advice and assistance, the first not always followed, and the second often accepted without gratitude—even they yield an involuntary consideration to a lady who gives them no more trouble than she can avoid, and is always capable of thinking and acting for herself in all things—so far as the natural decencies of her sex allow. True, these have their limits, which it would be folly, if not worse, for her to attempt to pass; but a certain fine instinct, which,

we flatter ourselves, is native to us women, will generally indicate the division between brave self-reliance and bold assumption.

Perhaps the line is easiest drawn, as in most difficulties, where duty ends and pleasure begins. We should respect one who, on a mission of mercy or necessity, went through the lowest portions of St Giles or the Gallowgate; we should be rather disgusted if she did it for mere amusement or bravado. All honour to the poor sempstress or governess who traverses London streets alone, at all hours of day or night, unguarded except by her own modesty; but the strong-minded female who would venture on a solitary expedition to investigate the humours of Cremorne Gardens or Greenwich fair, though perfectly 'respectable,' would be an exceedingly condemnable sort of personage. There are many things at which, as mere pleasures, a woman has a right to hesitate; there is no single duty, whether or not it lies in the ordinary line of her sex, from which she ought to shrink, if it is plainly set before her.

Those who are the strongest advocates for the passive character of our sex, its claims, proprieties, and restrictions, are, I have often noticed, if the most sensitive, not always the justest or most generous. I have seen ladies, no longer either young or pretty, shocked at the idea of traversing a street's length at night, yet never hesitate at being 'fetched' by some female servant, who was both young and pretty, and to whom the danger of the expedition, or of the late return alone, was by far the greater of the two. I have known anxious mothers, who would not for worlds be guilty of the indecorum of sending their daughters unchaperoned to the theatre or a ball—and very right, too!—yet send out some other woman's young daughter, at eleven P.M., to the stand for a cab, or to the public-house for a supply of beer. It never strikes them that the doctrine of female dependence extends beyond themselves, whom it suits so easily, and to whom it saves much trouble; that either every woman, be she servant or mistress, sempstress or fine lady, is to receive the 'protection' suitable to her degree; or that each is to be educated into a self-dependence, which will at least enable her to hold the balance of justice even, nor allow an over-delicacy for one woman to trench on the rights, conveniences, and honest feelings of another.

We must help ourselves. In this curious phase of social history, when marriage is apparently ceasing to become the common lot, and a happy marriage the most uncommon lot of all, we must educate our women into what is far better than any blind clamour for ill-defined 'rights'—into what ought always to be the foundation of rights—duties. And there is one, the silent practice of which will secure to them almost every right they can fairly need—the duty of self-dependence. Not after any amazonian fashion; no mutilating of fair womanhood in order to assume the unnatural armour of men; but simply by the full exercise of every faculty, physical, moral, and intellectual, with which Heaven has endowed women, severally and collectively, in different degrees; allowing no one to rust or lie idle, merely because their owner is a woman. And, above all, let us lay the foundation of all real womanliness by teaching our maidens from their cradle that the priceless pearl of decorous beauty, chastity of mind as well as body, exists in themselves alone; that a single-hearted and pure-minded woman may go through the world, like Spenser's Una, suffering, indeed, but never defenceless; foot-sore and smirched, but never tainted; exposed, doubtless, to many trials, yet never either degraded or humiliated, unless by her own act she humiliates herself.

For Heaven's sake—for the sake of 'womanhede,' the most heavenly thing next angelhood, as men tell us when they are courting us, and which it depends

upon ourselves to make them believe in all their lives—young girls, trust yourselves; rely on yourselves! Be assured that no outward circumstances will harm you while you keep the jewel of purity in your bosom, and are ever ready with the steadfast, clean right hand, of which, till you use it, you never know the strength, though it be only a woman's hand.

Fear not the world: it is often juster to us than we are to ourselves. If in its harsh jostlings the 'weaker goes to the wall'—as so many allege always happens to a woman—you will almost always find that this is not merely because of her sex, but from some inherent qualities in herself, which, existing either in woman or man, would produce just the same result, usually more pitiful than blamable. The world is hard enough, for two-thirds of it are struggling for the dear life—'each for himself, and de'il tak the hindmost;' but it has a rough sense of moral justice after all. And whosoever denies that, spite of all hinderances from individual wickedness, the *right* shall not ultimately prevail, impugns not merely human justice, but the justice of God.

The age of chivalry, with all its benefits and harmfulnesses, is gone by, for us women. We cannot now have men for our knights-errant, expending blood and life for our sake, while we have nothing to do but sit idle on balconies, and drop flowers on half-dead victors at tilt and tourney. Nor, on the other hand, are we dressed-up dolls, pretty playthings, to be fought and scrambled for—petted, caressed, or flung out of window, as our several lords and masters may please. Life is much more equally divided between us and them. We are neither goddesses nor slaves; they are neither heroes nor semi-demons: we just plod on together, men and women alike, on the same road, where daily experience illustrates Hudibras's keen truth, that

The value of a thing
Is just as much as it will bring.

And our value is—exactly what we choose to make it.

Perhaps at no age since Eve's were women rated so exclusively at their own personal worth, apart from poetic flattery or unmanly depreciation; at no time in the world's history judged so entirely by their individual merits, and respected according to the respect which they earn for themselves. And shall we esteem ourselves so meanly as to consider this unjust? Shall we not rather accept our position, difficult indeed, and requiring from us more than the world ever required before; but from its very difficulty, rendered the most honourable?

Let us not be afraid of men; for that, I suppose, lies at the root of all these amiable hesitations. 'Gentlemen don't like such and such things.' 'Gentlemen fancy so and so unfeminine.' My dear little foolish cowards, do you think a man—a good man, in any relation of life, ever loves a woman the more for esteeming her the less? or likes her better for transferring all her burdens to his shoulders, and pinning her conscience to his sleeve? Or, even if he did like it, is a woman's divinity to be man—or God?

And here, piercing to the Foundation of all truth—I think we may find the truth concerning self-dependence, which is only real and only valuable when its root is not in self at all—when its strength is drawn not from man, but from that Higher and Diviner Source whence every individual soul proceeds, and to which alone it is accountable. As soon as any woman, old or young, once feels that, not as a vague sentimental belief, but as a tangible, practical law of life, all weakness ends, all doubt departs: she recognises the glory, honour, and beauty of her existence; she is no longer afraid of its pains; she desires not to shift one atom of its responsibilities to another. She is content to take it just as it is, from the hands of the

All-Father; her only care being to so fulfil it, that while the world at large may recognise and profit by her self-dependence, she herself, knowing that the utmost strength lies in the deepest humility, recognises, solely and above all, her dependence upon God.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXVIII.—THE WOODS ON FIRE!

THE trappers were not among those who had rescued me—where were they? The others made answer, though I already guessed what they had to tell. Rube and Garey had followed the tracks of the steed, leaving the rangers to come after me.

I was pleased with the ready intelligence of my comrades: they had acted exactly as they should have done. I was myself found, and I no longer entertained any apprehension that the trail would be lost.

By this time, the trappers must be far upon it; more than an hour had elapsed since they and the others had parted company. My zigzag path had cost my followers many a bewildering pause.

But they had not ridden recklessly as I, and could find their way back. As it was impossible to tell in what direction Rube and Garey had gone, this course was the best to be followed; and under the guidance of Stanfield, an expert woodsman, we commenced returning to the prairie. It was not necessary to follow back our own crooked trail. The Kentuckian had noted the 'lay' of the chapparal, and led us out of its labyrinths by an almost direct path.

On reaching the open prairie, we made no halt; but upon the tracks of Rube, Garey, and the steed, once more entered the chapparal.

We had no difficulty about our course; it was plainly traced out for us; the trappers had 'blazed' it. In most places, the tracks of the three horses were sufficient indices of the route; but there were stretches where the ground was stony, and upon the parched arid herbage, even the shod hoof left no visible mark. In such places, a branch of acacia broken and pendulous, the bent flower-stem of an alce or the succulent leaves of the cactus slashed with a sharp knife, were conspicuous and unmistakable signs; and by the guidance of these we made rapid advance.

We must have gone much faster than the trackers themselves—for notwithstanding the freshness of the trail, there were dry spots and patches of cut rock over which it passed, and where it must have cost both time and keen perception to trace it.

As we were travelling so much more rapidly than Rube and Garey could have done, I looked forward to our soon overtaking them; with eager anticipation, I looked forward. Surely they would have some news for me, now that they had been so long in the advance? Surely by this time they must have come in sight of the steed?—perhaps captured him? O joyous anticipation!

Or would they return with a different tale? Was I to meet the report that he still hurried on—on forever? That he had swum some rapid stream? or plunged over a precipice—into some dark abyss?

Though hastening on after the trackers, there were moments when I feared to overtake them—moments when I dreaded to hear their tale!

We had worked our way about five miles through the hideous jungle, when I began to feel a strange sensation in my eyes—a sensation of pain—what is usually termed a 'smarting.' I at first attributed it to the want of sleep. My companions complained that they were affected in a similar manner.

It was not until we had gone some distance farther, that we found the true explanation, by perceiving that

there was smoke upon the air! Smoke it was that was causing the bitterness in our eyes.

The denizen of the prairie never regards such an indication with indifference. Where there is smoke, there is fire, and where fire, danger—at least upon the broad grassy steppes of the west. A burning forest may be shunned. You may stand near to the forest on fire, and contemplate such a scene with safety; but a blazing prairie is a phenomenon of a different character; and it is indeed a rare position where you may view, without peril, this sublime spectacle.

There are prairies that will not burn. The plains covered with the short 'buffalo-grass' (*sesleria dactyloides*), and the sward of various species of 'gramma' (*chondrosium*), rarely take fire; or if they do, horse, man, buffalo, or antelope, can easily escape by leaping across the blaze. 'Tis only the reptile world—snakes, lizards, the toad, and the land-turtle (*terrapin*)—that fall victims to such a flame.

Not so upon the 'weed-prairies,' or those where the tall reed-grass rises above the withers of a horse—its culms matted and laced together by the trailing stems of various species of bindweed, by creeping convolvulus, cucurbitaceæ, and wild pea-vines. In the dry season, when a fire lays its hold upon vegetation of this character, there is danger indeed—where it rages, there is death.

It was smoke that affected our eyes, causing them to smart and water. Fire must be causing the smoke—what was on fire? I could detect apprehension in the looks of my followers, as we rode on. It was but slight, for as yet the smoke was scarcely perceptible, and the fire, wherever it was, must be distant—so fancied we.

As we advanced, the glances of the men became more uneasy. Beyond a doubt, the smoke was thickening around us—the sky was fast becoming darker, and the pain in our eyes more acute.

'The woods are on fire,' said Stanfield.

Stanfield was a backwoodsman—his thoughts ran upon 'woods.'

Whether forest or prairie, a conflagration was certainly raging. It might be far off, for the wind will carry the smoke of a prairie-fire a long distance; but I had an unpleasant suspicion that it was not distant. I noticed dropping around us the white floc of burnt leaves, and from the intense bitterness of the smoke, I reasoned that it could not have floated far—its gases were not yet dissipated.

It was not the distance of the fire that so much troubled me, as its direction. The wind blew right in our teeth, and the smoke was travelling with the wind. The conflagration must be ahead—directly upon the trail!

The smoke grew thicker and thicker—ahead, the sky appeared slashed with a lurid light; I fancied I could hear the crackling of the flames. The air felt hot and dry: a choking sensation came into our throats, and one and all were soon hacking and gasping for breath.

So dark had it suddenly become, or rather, so blinded were we with the smoke, we could scarcely make out the trail.

My followers would have stopped, but I urged them on. With voice and example, I urged them on—myself leading the way. My heart was too sore to make pause.

Where in all this were Rube and Garey? We had come far and fast; we should now be nearly up with them—they could not be much ahead.

I hailed as we advanced.

'Hallow!' came the response, in the rough baritone of the younger trapper.

We hurried forward in the direction of the voice. The path conducted to an opening in the chapparal, in the centre of which, through the smoke, we could distinguish the forms of men and horses.

With eager eyes, I scanned the group; a glance was sufficient: there were only two of each—only the trackers.

CHAPTER LXIX.

SMOKE AND THIRST.

'Ah, Monsieur Roob!' cried the Canadian, as we hurried up, 'vat make ce de la diable d'une fumée—smoke? Are ze woods on fire—you tink—eh?'

'Wuds!' exclaimed Rube, with a contemptuous glance at the speaker. 'Wagh! Thur's no wuds hyur. Thur's a paraira afire. Don't ee smell the stink o' the grass?'

'Pe gar, oui! vraiment—c'est la prairie? You sure, Monsieur Roob?'

'Sure!' vociferated the trapper in a tone of indignation—'Sure!—ye durned parley-voo-eat-a-frog, spit-a-brick, soup-suckin Frenchman, d'yur think I don't know the smell o' a burnin paraira? Wagh!'

'Ah, Monsieur Roob, me pardon. Vat I mean ask—is ze chapparal brûlé—on fire—ces arbres?'

'The chapparil ain't afire,' answered Rube, somewhat mollified by the apology: 'so don't be skeeart, Frenchy; yur safe enuf.'

This assurance seemed to gratify not only the timid Canadian, but others, who, up to this moment, were apprehensive that it was the thicket that was on fire.

For myself, I had no such fears; I perceived that the chapparal could not burn. Here and there, patches of dry mezquite-trees would have caught like tinder; but in most places, a succulent endogenous vegetation formed three parts of the jungle, and rendered it 'fire-proof.' This was especially the case around the glade where the trappers had taken their stand, and which was completely enclosed by a wall of the great organ cactus, with aloes, opuntias, and other juicy-leaved plants. In the opening, we were as safe from the fire as though it was a hundred miles off; we suffered only from the smoke, that now quite filled the atmosphere, causing a darkness that rivalled night.

I had no apprehension for our safety; it was not of that I was thinking.

To the hasty dialogue between Rube and the Canadian I had scarcely given heed; Garey had advanced to meet me, and I listened with anxious ear to the tale of the tracker.

It was soon told. Rube and he had followed the trail, until it emerged from the chapparal, and struck out into a wide grass-prairie. The edge of the thicket was close by; but they had gone a considerable distance beyond it and across the plain. They were still advancing, when, to their consternation, they perceived that the prairie was on fire directly ahead of them! The wind was rolling both smoke and flames before it with the rapidity of a running horse, and it was with difficulty they escaped from it by galloping back to the chapparal.

And the steed—what had become of him? Had they seen nothing?

I did not put these questions in words—only in thought did I ask them; and in thought only were they answered. Both the trackers were silent, and that was an answer in the negative; yes, I read an ominous negative in their looks of gloom.

We were compelled to halt; even the smoke rendered further progress impossible; but we could hear the fire at no great distance—the culms of the coarse reed-grass cracking like volleys of musketry.

Now and then, a scared deer broke through the bushes, passing us at full speed. A band of antelope dashed into the glade, and halted close beside us—the frightened creatures not knowing where to run. At their heels came a pack of prairie-wolves, but not in pursuit of them: these also stopped near. A black bear and a cougar arrived next; and fierce beasts of prey and gentle ruminants stood side by side, both

terrified out of their natural habits. Birds shrieked among the branches, eagles screamed in the air, and black vultures could be seen hovering through the smoke, with no thought of stooping upon a quarry!

The hunter man alone preserved his instincts. My followers were hungry. Rifles were levelled—and the bear and one of the antelopes fell victims to the deadly aim.

Both were soon stripped of their skins, and butchered. A fire was kindled in the glade, and upon sword-blades and sapling spits the choice morsels of venison and 'bear-meat' were roasted, and eaten, with many a jest about the 'smoky kitchen.'

I was myself hungered. I shared the repast, but not the merriment. At that moment, no wit could have won from me a smile; the most luxurious table could not have furnished me with cheer.

A worse appetite than hunger assailed my companions, and I felt it with the rest—it was thirst: for hours all had been suffering from it; the long hard ride had brought it on, and now the smoke and the dry hot atmosphere increased the appetite till it had grown agonising, almost unendurable. No water had been passed since the stream we had crossed before day; there was none in the chapparral; the trackers saw none so far as they had gone: we were in a waterless desert; and the very thought itself renders the pang of thirst keener and harder to endure.

Some chewed their leaden bullets, or pebbles of chalcedony which they had picked up; others obtained relief by drinking the blood of the slaughtered animals—the bear and the antelope—but we found a better source of assuagement in the succulent stems of the cactus and agave.

The relief was but temporary: the juice cooled our lips and tongues, but there is an acrid principle in these plants that soon acted, and our thirst became more intense than ever.

Some talked of returning on the trail in search of water—of going back even to the stream—more than twenty miles distant.

Under such circumstances, even military command loses its authority. Nature is stronger than martial law.

I cared not if they did return; I cared not who left me, so long as the trappers remained true. I had no fear that they would forsake me; and my disapprobation of it checked the cheerless proposal, and once more all declared their willingness to go on.

Fortunately, at that crisis the smoke began to clear away, and the atmosphere to lighten up. The fire had burnt on to the edge of the chapparral, where it was now opposed by the sap-bearing trees. The grass had been all consumed—the conflagration was at an end.

Mounting our horses, we rode out from the glade; and following the trail a few hundred yards farther, we emerged from the thicket, and stood upon the edge of the desolated plain.

CHAPTER LXX.

A BURNT PRAIRIE.

The earth offers no aspect more drear and desolate than that of a burnt prairie. The ocean when its waves are gray—a blighted heath—a flat fenny country in a rapid thaw—all these impress the beholder with a feeling of chill monotony; but the water has motion, the heath, colour, and the half-thawed flat exhibits variety in its mottling of white and ground.

Not so the steppe that has been fired and burned. In this, the eye perceives neither colour, nor form, nor motion. It roams over the limitless level in search of one or other, but in vain; and in the absence of all three, it tires, and the heart grows cheerless and sick. Even the sky scarcely offers relief. It, too, by refraction from the black surface beneath, wears a dull livid

aspect; or perhaps the eye, jaundiced by the reflect of the earth, beholds not the brightness of the heaven.

A prairie, when green, does not always gladden the eye—not even when enamelled with fairest flowers. It has crossed such plains, verdant or blooming to the utmost verge of vision, and longed for something to appear in sight—a rock, a tree, a living creature—anything to relieve the universal sameness; just as the voyager on the ample ocean longs for sail for cetaceæ, or the sight of land, and is delighted with a nautilus, polypi, phosphorescence, or a floating weed.

Colour alone does not satisfy the sense. What is more charming than the fresh verdure of the green plain? what more exquisite than the deep blue of the ocean? and yet the eye grows weary of both! Even the 'flower-prairie,' with its thousands of gay corolla of every tint and shade—with its golden helianthus, its white argemone, its purple cleome, its pink mimosæ, its blue lupin—its poppyworts of red and orange—even these fair tints grow tiresome to the sight, and the eye yearns for form and motion.

If so, what must be the prairie when divested of all its verdant and flowery charms—when burned black ashes? It is difficult to conceive the aspect of dreary monotony it then presents—more difficult to describe it. Words will not paint such a scene.

And such presented itself to our eyes as we rode from the chapparral. The fire was past—even the smoke had ceased to rise, except in spots where the damp earth still reeked under the heat; but right and left, and far ahead, on to the very hem of the horizon the surface was of one uniform hue, as if covered with a vast crape. There was nought of form to be seen, living or lifeless; there was no life or motion even in the elements; all sounds had ceased: an awful stillness reigned above and around—the world seemed dead and shrouded in its sable pall!

Under other circumstances, I might have stayed to regard such a scene, though not to admire it. On the other hand, had it been a waste, there was nought to be admired not even sublimity; but no spectacle however sublime or however beautiful, could have won from me a thought at that moment.

The trackers had already ridden far out, and were advancing, half concealed by the cloud of black smoke flung up from the heels of their horses. For some distance, they moved straight on without looking at the tracks of the steed. Before meeting the fire, they had gone beyond the edge of the chapparral; afterwards, while I observed them moving more slowly, with their eyes upon the ground as if looking for the trail, I had doubts of their being able either to find or follow it now. The shallow hoof-prints would be filled with the debris of the burnt herbage—surely they could no longer be traced?

By myself, they could not, nor by a common man; but it seemed that to the eyes of those keen hunters the trail was as conspicuous as ever. I saw that after searching a few seconds, they had taken it up, and were once more moving along, guided by the tracks. Some slight hollows I could perceive, distributed here and there over the ground, and scarcely distinguishable from the surrounding level. Certainly, without having been told what they were, I should not have known them to be the tracks of a horse.

It proved a wide prairie, and we seemed to be crossing its central part. The fire had spread far.

At one place, nearly midway, where the trail was faint, and difficult to make out, we stopped for a short while to give the trackers time. A momentary curiosity induced me to gaze around. Awful was the scene—awful without sublimity. Even the thorny chapparral no longer relieved the eye; the outlines of its low shrubbery had sunk below the horizon, and on all sides stretched the charred plain up to the rim of the leaden canopy, black—black—illimitable. And

en alone, I might easily have yielded to the fancy, at the world was dead.

Gazing over this vast opacity, I for a moment forgot my companions, and fell into a sort of lethargic stupor. I fancied that I too was dead or dreaming—I fancied that I was in hell—the *Avernus* of the ancients. In youth, I had the misfortune to be well schooled in classic lore, to the neglect of studies that are useful; I often in life have the poetical absurdities of Greek and Latin mythology intruded themselves upon my mind—both asleep and awake. I fancied, therefore, at some well-meaning Anchises had introduced me to the regions below; and that the black plain before me was some landscape in the kingdom of Pluto. I had been capable of that—would have convinced me of my error. No part of that monarch's minions can be so thinly peopled. I was summoned to reason again by the voices of my fellows. The lost trail had been found, and they were moving on.

CHAPTER LXXI.

THE TALK OF THE TRACKERS.

I spurred after, and soon overtook them. Regardless of the dust, I rode close in the rear of the trackers, and listened to what they were saying.

These 'men of the mountains'—as they prided to all themselves—were peculiar. While engaged in a way, such as the present, they would scarce disclose their thoughts, even to me; much less were they communicative with the rest of my following, whom they were accustomed to regard as 'greenhorns'—their favorite appellation for all men who have not made the tour of the grand prairies. Notwithstanding that half-breed and Black were backwoodsmen and hunters by profession, Quackenbush a splendid shot, Le Blanc a regular 'voyageur,' and the others more or less skilled in woodcraft, all were greenhorns in the opinion of the trappers. To be otherwise, a man must have starved upon a 'sage-prairie'—'run' buffalo by the Yellowstone Plateau—fought 'Injun,' and shot Indian—have well-nigh lost scalp or ears—spent a winter in Pierre's Hole upon Green River—or camped amid the snows of the Rocky Mountains! Some one of all these feats must needs have been performed ere the 'greenhorn' can matriculate and take rank as a 'mountain man.'

Of all my party was the only one who, in the eyes of Rube and Garey, was not a greenhorn; and even I—gentleman-amateur that I was—was hardly up either in their confidence or their 'craft.' It is indeed true—with all my classic accomplishments, with my fine words, my fine horse, and fine clothes—so long as we were within the limits of prairie-land, I acknowledged these men as my superiors. They were my guides, my instructors, my masters.

Since overtaking them on the trail, I had not asked them to give any opinion. I dreaded a direct answer—for I had noticed something like a despairing look in the eyes of both.

As I followed them over the black plain, however, I thought that their faces brightened a little, and appeared once more lit up by a faint ray of hope. For that reason, I rode close upon their heels, and eagerly caught up every word that was passing between them. Rube was speaking when I first drew near.

'Wah! I don't b'lieve it, Bill; 'tain't possible no-how-so-ever. The paraira wur sot afire—must 'a been; thur's no other ways for it. It cudn't 'a tuk to b'leasin' o' itself—eh?'

'Sartinly not; I agree wi' you, Rube.'

'Wal—thur wur a foller as I met onces at Bent's Fort on the Arkinsaw—a odd sort o' a critter he wur, an no mistake; he us't to go pokin about, gatherin' woods an all sorts o' green garbitch, an spreadin' 'em out atween sheets o' paper—whet he called button-

eyesin—jest like thet ur Dutch doctur as wur rubbed out when we went into the Navagh country, t' other side o' the Grand.'

'I remembers him.'

'Wal, this hyur fellur I tell 'ee about, he us't to talk mighty big o' this, thet, an t' other; an he palavered a heap 'bout a thing thet, ef I don't disremember, wur called *spuntaynyus kumbuxshun*.'

'I've heard o' t; that are the name.'

'Wal, the button-eyeser, he sayed thet a paraira mout take afire o' itself, 'ithout anybody whasomdiver hevins sot it. Now, thet ur's what this child don't b'lieve, nohow. In coorse, I knows thet lightnin sometimes may sot a paraira a bleezin, but lightnin 's a natral fire o' itself; an it's only reezunible to expect thet the dry grass wud catch from it like punk; but I shed like to know how fire kud kindle by itself—thet 's whet I shed like to know.'

'I don't believe it can,' rejoined Garey.

'Ne'er a bit o' it. I never seed a burnin paraira yit, thet thur wa'n't eyther a camp-fire or a Injun at the bottom o' it—thet ur 'ceptin whur lightnin hed did the bizness.'

'And you think, Rube, thar's been Injun at the bottom o' this?'

'Putty nigh sure; an I'll gie you my reezuns. Fust, do 'ee see thur's been no lightnin this mornin to 'a made the fire? Seconds, it's too fur west hyur for any settlement o' whites—in coorse I speak o' Texans—thur might be Mexikins; them I don't call white, nohow nosomediver. An then, agin, it kin scarce be Mexikins neyther. It ur too fur no'th for any o' the yellur bellies to be a strayin jest now, seein as it's the *Mexikin moon wi'* the Kimanchees, an both them an the Leepans ur on the war-trail. Wal, then, it's clur thur's no Mexikin 'bout hyur to hev sot the paraira afire, an thur's been no lightnin to do it; thurfor, it must 'a been did eyther by a Injun, or thet ur dod-rotted spuntaynyus kumbuxshun.'

'One or t' other.'

'Wal, bein as this child don't b'lieve in the kumbuxshun nohow, thurfor it's my openynus thet red Injuns did the bizness—they did sartint.'

'No doubt o' it,' assented Garey.

'An ef they did,' continued the old trapper, 'thur about yit somewhur not fur off, an we've got to keep a sharp look-out for our har—we hev.'

'Safe, we have,' assented Garey.

'I tell 'ee, Bill,' continued Rube in a new strain, 'the Injuns is mighty riled jest now. I never knowd 'em so savagerous an flighty. The war hez gin 'em a fresh start, an thur dander's up agin us, by reezun thet the gin'ral didn't take thur offer to help us agin the yellur bellies. Ef we meet wi' eyther Kimanch or Leepan on these hyur plains, thu'll scalp us, or we'll scalp 'em—thet 'll be it. Wah!'

'But what for could they 'a sot the parairy on fire?'

inquired Garey.

'Thet ere,' replied Rube, 'thet ere wur what puzzled me at fust. I thort it mout 'a been done by accydent—preehaps by the scatterin o' a camp-fire—for Injuns is careless enuf 'bout thet. Now, hows'owever I've got a different idee. Thet story thet Dutch an Frenchy hev fetched from the rancherie, gie me a insight inter the hull bizness.'

I knew the 'story' to which Rube had reference. Lige and Le Blanc, when at the village, had heard some rumour of an Indian foray that had just been made against one of the Mexican towns, not far from the rancheria. It had occurred on the same day that we marched out. The Indians—supposed to be Lipans or Comanches—had sacked the place, and carried off both plunder and captives. A party of them had passed near the rancheria after we ourselves had left it. This party had 'called' at the Hacienda de Vargas and completed the pillage, left unfinished by the

guerilla. This was the substance of what the messengers had heard.

'You mean about the Injuns?' said Garey half interrogatively.

'In coorse,' rejoined Rube. 'Belike enuf, 'em Injuns ur the same niggurs we gin sich a rib-roastin to by the moun. Wagh! they hain't gone back to thur mountains, as 'twur b'lieved: they dassent 'a gone back in sich disgrace, 'ithout takin eyther har or hosses. The squaws ud 'a hooted 'em.'

'Sure enough.'

'Sure sartint. Wal, Billee, 'ee see now what I mean: thet party 's been a skulketin 'bout hyur ever since, till they got a fast-race chance at the Mexikin town, an thur they 've struck a blow.'

'It 's mighty like as you say, Rube; but why have they sot fire to the parairy?'

'Wagh! Bill, kin ye not see why: it ur plain as Pike's Peak on a summery day.'

'I don't see,' responded Garey in a thoughtful tone.

'Well, this child *do*; an this ur the reezun: as I tell 'ee, the Injuns hain't forgot the lambaystin they hed by the moun; an preehaps bein now a weak party, an thinkin thet we as wolloped 'em wur still i' the rancherie, they wur aferd thet on hearin o' thur pilledgin, we mout be arter 'em.'

'An they 've burnt the parairy to kiver thur trail?'

'Preezactly so.'

'By Gosh, you're right, Rube!—it's uncommon like. But whar do you think this trail 's goin? Surely the hoss hain't been caught in the fire?'

I bent forward in the saddle, and listened with acute eagerness. To my great relief, the answer of the old trapper was in the negative.

'He hain't,' said he; 'ne'er a bit o' it. His trail, do 'ee see, runs in a bee-line, or clost on a bee-line: now, ef the fire hed 'a begun afore he wur acrost this paraira, he wud long since 'a doubled 'bout, an tuk the back track; but 'ee see he hain't did so; thurfor, I conclude he 's safe through it, an the grass must 'a been sot afire ahint 'im.'

I breathed freely after listening to these words. A load seemed lifted from my breast, for up to this moment I had been vainly endeavouring to combat the fearful apprehension that had shaped itself in my imagination. From the moment that we had entered the burned prairie, my eyes constantly, and almost mechanically, had sought the ground in front of our course, had wandered over it, with uneasy glance, in dread of beholding forms—lifeless—burned and charred—

The words of the trapper gave relief—almost an assurance that the steed and his rider were still safe—and, under inspiration of renewed hope, I rode more cheerfully forward.

CHAPTER LXXII.

'INJUN SIGN.'

'After a pause, the guides resumed their conversation, and I continued to listen. I had a reason for not mingling in it. If I joined them in their counsels, they might not express their convictions so freely, and I was desirous of knowing what they truly thought. By keeping close behind them, I could hear all—myself unnoticed under the cloud of dust that rose around us. On the soft ashes, the hoof-stroke was scarcely audible, our horses gliding along in a sweeping silent walk.

'By Gosh! then,' said Garey, 'if Injuns fired the parairy, they must 'a done it to wind'ard, an we're travellin right in the teeth o' the wind; we're goin in a y'gy direction, Rube; what do you think o' 't, old hoss?'

'Jest what you sez, boyee—a cussed ugly direckshun—durnation'd ugly.'

'It ain't many hours since the fire begun, an the redskins won't be far from t' other side, I reckon. If the hoss-trail leads us right on them, we'll be in a fit old boy.'

'Ay,' replied Rube, in a low but significant drawl; 'ef it do, an ef this niggur don't a miskalkerate, *it will lead right on 'em, plum straight castrut into the camp.*'

I started on hearing this. I could no longer remain silent; but brushing rapidly forward to the side of the trapper, in hasty phrase demanded his meaning.

'Jest what 'ee've heern me say, young fellur, wa his reply.

'You think that there are Indians ahead—that the horse has gone to their camp?'

'No, not *gone* thur; nor kin I say for sartint thur ur Injuns yet; though it looks mighty like. Thur's nuthin else to giv reezun for the fire—nuthin as Bill or me kin think o'; an ef thur be Injuns, then I don't think the hoss *hez gone* to thur camp, but I *de* kalkerlate it's mighty like he's been *tuk* thur: thet's what I thinks, young fellur.'

'You mean that the Indians have captured him?'

'Thet's preezactly what this child means.'

'But how? What reason have you for thinking so?'

'Wal—jest because I think so.'

'Pray explain, Rube!' I said in an appealing tone. I feared that his secretive instincts would get the better of him, and he would delay giving his reasons from a pure love of mystification that was inherent in the old fellow's nature. I was too anxious to be patient; but my appeal proved successful.

'Wal, 'ee see, young fellur, the hoss must 'a cross hyur jest afore this paraira wur sot afire; an it's mighty reezunible to s'pose thet whosomediver *do* the bizness, Injun or no Injun, must 'a been to win'ad o' hyur. It ur also likely enuf, I reckon, thet the party must 'a seed the hoss; an it ur likely agin thet nobody want a gwine to see thet hoss, wi' the gun stopp'd down 'long his hump ribs, 'ithout bein kewurious enuf to take arter 'im. Injuns 'ud be safe to go arter 'im, yellin like blazes; an arter 'im they wud go, an roped 'im, I reckon—thet they 've done.'

'You think they could have caught him?'

'Sartint. The hoss by then must 'a been dead dead—thet ur, unless he's got the divvel in 'im; an by Geehorum! I gin to suspect—Gehu—Gebosopha! jest as I said: lookee, thur—thur!'

'What is it? I inquired, seeing the speaker suddenly halt and point to the ground, upon which his eyes also were fixed. 'What is it, Rube? I can perceive nothing strange.'

'Don't 'ee see 'em hoss-tracks?—thur!—thick as sheep-feet—hundreds o' 'em!'

I certainly noticed some slight hollows in the surface, nearly levelled up by the black ashes. I should not have known them to be horse-tracks.

'They ur,' said Rube, 'every one o' 'em—an Injun hoss-tracks sure.'

'They may be the wild-hosses, Rube?' said one of the rangers, riding up and surveying the sign.

'Wild jackasses!' angrily retorted the old trapper. 'Whur did you ever see a wild hoss? Do 'ee s'pose I've turned stone-blind, do 'ee? Stan thur, my mar!' he cried, flinging his lean carcass out of the saddle at the same time talking to his mare: 'ee knows better than thet fellur, I kin tell by the way yur snifin. Keep yur ground a minnit, ole gurl, till ole Rube shew these hyur greenhorns how a mountain man kin read sign—wild hosses! wagh!'

After thus delivering himself, the trapper dropped upon his knees, placed his lips close to the ground, and commenced blowing at the black ashes. All had by this time ridden up, and sat in their saddles watching him.

We saw that he was clearing the ashes out of one of the hollows which he had pronounced to be horse-racks, and which now proved to be so.

'Thur now, mister!' said he, turning triumphantly, and rather savagely, upon the ranger who had questioned the truth of his conjecture: 'thur's a shod rack—shod wi' parfleesh too. Did 'ee ever see a wild ass, or a wild mule, or a wild jackass eyther, shod n' parfleesh? Ef 'ee did, it's more'n Rube Rawlins ver seed, an thet ur trapper's been on the hoss-plains well-nigh forty yeern. Wagh!'

Of course, there was no reply to this interrogatory. Here was the track, and, dismounting, we all examined it in turn.

Sure enough, it was the track of a shod horse—shod with *parfleesh*—thick leather made from the hide of the buffalo bull.

We all knew this to be a mode of shoeing practised by the horse-Indians of the plains, and only by them.

The evidence was conclusive: Indians had been upon the ground.

A BIRD'S-EYE VIEW OF TOBACCO.

Oh, thou weed

Who art so lovely fair and smell'st so sweet

That the sense aches at thee, would thou hadst ne'er been born!

—SHAKESPEARE.

Has the reader ever watched the rise and progress of a paper-war?—A quiet harmless-looking letter, with a modest Latin or Greek signature—Alpha, for instance—appears on Monday morning in the *Times*, let us say, pointing out an abuse, advocating a reform, or prosing a the usual respectable and patriotic way on one of the thousand-and-one topics that form the subjects of newspaper correspondence. The gauntlet is thus thrown down, the hat is tossed into the ring. By the act of writing a letter to the *Times*, Alpha emerges from his character as a private individual, and is bound to do battle à l'outrance against all comers in defence of his opinions. The challenge is accepted. On Tuesday, anything he has stated is flatly contradicted in a letter signed Beta, in which the writer broadly insinuates that he considers Alpha either a knave or a fool, or possibly a union of both. On Wednesday, Gamma starts up in defence of Alpha, and abuses Beta like a pocket. On Thursday, Delta takes up the cudgels for Beta, and makes mince-meat of Alpha and Gamma. In the meantime, a shower of replies, rejoinders, and such-like controversial fireworks have been let off by the other three; and by the end of the week, the whole alphabet, from Alpha to Omega, are hard at work, hammer and tongs, to the serious damage of their own tempers, and the intense delight and edification of the public. These intellectual gladiators are exactly like the vultures described by Longfellow:

Never stoops the soaring vulture
On his quarry in the desert,
On the sick or wounded bison,
But another vulture, watching
From his high aerial look-out,
Sees the downward plunge, and follows;
And a third pursues the second,
Coming from the invisible ether,
First a speck, and then a vulture,
Till the air is dark with pinions.

In the same way it may be said:

Never writes the 'Constant Reader'
To that much-enduring martyr
Called 'The Editor' of a paper,
But another 'Reader,' sitting
In his comfortable club-house,
Sees the feeble scrawl, and answers;
And a third attacks the second,
Each epistle getting longer—
First a line, and then a column,
Till the paper's full of letters.

One of these pen-and-ink combats has been lately raging with much bitterness between the smoking and non-smoking members of the community, during which passage of pens, the subject of tobacco, to use a modern expression, has been thoroughly 'ventilated.' The *Lancet* has been the principal medium through which the tobacco-stoppers have fulminated their anathemas against the fragrant plant; while its devotees—and their name is legion—have, in their own opinion, triumphantly confuted the arguments of its detractors in a cloud of letters, pamphlets, 'pleas for the pipe,' and other well-fumigated productions. I have before me a whole heap of these paper-pellets, one half demonstrating beyond a question that tobacco is a poison and a bane, and the other half proving as positively that it is a balm and a blessing.

Without attempting to decide this important question, and believing that the golden rule, *medeo tutissimus ibis*, applies to smoking as well as every other gratification, I shall attempt to compress into the limits of a page or two a few of the facts concerning the history, cultivation, and manufacture of tobacco, which have been elicited in the course of the controversy.

One of the best volumes on the subject has been written by Mr Steinmetz, a barrister, who acknowledges himself to be an inveterate smoker, and who had a cigar in his mouth continually during the composition of his work, which extends to 174 pages. The learned gentleman starts with the dictum, that the natives of every country on the globe have had from time immemorial their own peculiar narcotic, either home-made or imported. Thus, in North America, they have tobacco; in South America, the thorn-apple, coca, tobacco, and hemp; in Europe, hops and tobacco; in Africa, hemp; and in Asia, amanita, betel-nut, and tobacco. Professor Johnson, the author of the *Chemistry of Common Life*, in illustration of the same idea, published a 'map shewing the distribution of narcotics over the globe.' The tobacco-plant, in its numerous varieties, is found from the equator to the 60th degree of latitude, but the savages of America enjoy the credit of having originally discovered its narcotic properties.—Sir Walter Raleigh, as everybody knows, gets the credit of having been the first to introduce it in England.*

It is related of him, that having retired to his room to have a comfortable weed in private, he soon became completely buried in smoke and contemplation. Finding this employment but dry work, and totally

* Raleigh may be regarded as connected with the introduction of tobacco into England, but not truly its introducer. The real history of the affair seems to have been briefly this. In the colonising expedition sent out by Raleigh to Virginia in 1584, was Hariot, the inventor of the system of notation in modern algebra. While exploring the country, he observed the culture of tobacco among the natives, who used it for 'crudities of the stomach.' Fully believing in the supposed virtues of the herb, he accustomed himself to its use. Hariot is thus to be regarded as certainly the first European who smoked tobacco. The colony lost heart under its difficulties, and when Sir Francis Drake came their way in 1585, on his return from a successful cruise against the Spanish settlements, Ralph Lane, the governor, asked and obtained a passage home for himself and the other colonists. With him came two or three of the natives, and a sample of Tobacco. The precipitate desertion of the colony by Lane was most unfortunate. Had he waited a few days longer, he would have received new colonists with ample supplies, which Raleigh had sent out. He therefore underwent heavy reproach, and sunk out of notice, though heretofore a man of some distinction. There can be no doubt that King James alludes to him in the following passage of the *Counterblast*: 'It is not so long,' says he, 'since the first entry of this abuse amongst us here, as this age can well remember, both the first author and the form of the first introduction of it amongst us. It was neither brought in by king, great conqueror, nor learned doctor of physick. With the report of a great discovery for a conquest, some two or three savage men were brought in, together with a savage custom. But the pity is, the poor barbarous men died; but that that vile barbarous custom is yet alive, yea, in fresh vigour: so it seems a miracle to me how a custom springing from so vile a ground, and brought in by a father so generally hated, should be welcomed upon so slender a warrant.'—ED. C. J.

forgetting that his occupation was as yet a secret, he presently called out to his servant for a cup of malt liquor. On entering the room, the man, instead of giving his master the beer, dashed it violently into his face, and rushed down stairs to alarm the family with the dreadful news that Sir Walter's head was on fire, and the smoke pouring out of his mouth and nostrils.

Since its introduction into civilised society, tobacco has had to encounter many enemies, among kings, popes, and populace; and, judging from the late attacks in the *Lancet*, its persecution has not by any means ceased in the present day. James I., the British Solomon, as he was called, in his celebrated *Counterblast*, written in 1616, characterises the practice of smoking as 'a custom loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black stinking fume thereof, nearest resembling the horrible Stygian smoke of the pit that is bottomlesse.' The expense of smoking in those days may be imagined from the fact mentioned by Aubrey, that tobacco 'was sold then for its wayte in silver.' 'I have heard,' he says, 'some of our old yeomen neighbours say that when they went to Malmesbury or Chippenham, they called their biggest shillings to lay in the scales against the tobacco.' The royal reformer also states in his *Miscopnus* that 'some of the gentry bestow three, and some four hundred pounds a yeere upon this precious stinke.'

In its pulverised form, the unfortunate plant has been thundered against from the Vatican. In 1624, Pope Urban VIII. published a decree of excommunication against all who took snuff in church. Ten years afterwards, Russians convicted of smoking tobacco had their noses cut off. In Transylvania, the penalty for growing it was total confiscation of property; and for smoking it, a fine not exceeding 200 florins. In 1719, the senate of Strasbourg prohibited the cultivation of tobacco, for fear it should diminish the growth of corn; and Amurath, fourth king of Persia, made smoking a capital offence. They managed these things better in France: instead of cutting off people's heads and noses, the government put its hand into their pockets. A heavy duty was imposed on tobacco, and its cultivation converted into a monopoly. The consequence of this manœuvre is, that last year our friends across the Channel paid into the coffers of the state, for the enjoyment of their narcotic, somewhere about L.5,000,000 sterling. We are mulcted by the Chancellor of the Exchequer to much the same amount. In the United Kingdom, in 1853, the consumption of tobacco was nearly 30,000,000 pounds, and the duty paid L.4,751,760. In Hamburg, 40,000 cigars are consumed daily, the number of adult males in the population not amounting to 45,000. The average consumption for the whole human race—about 1,000,000,000—is said to be 70 ounces a head; the total quantity smoked being 2,000,000 tons, or 4,480,000,000 pounds!

America is the great tobacco-garden of the world, although great quantities are grown both in India and Europe. The choicest specimens are found in the island of Cuba, which is said to be the jewel of the Spanish crown—the fragrant Havana cigar being absolutely necessary to propel the blue blood of her gentility. Manila tobacco is produced in the Philippine Islands, and Latakia in Syria. Tobacco was once extensively grown in Ireland and Yorkshire; and it is the opinion of Mr Steinmetz, that if it were not forbidden by law, its cultivation in this country would, with the aid of science in the matter of manure, prove a good speculation.

In America, the seed is sown in a hotbed about the beginning of March. In May, the transplanting begins, each plant being allowed the space of three square feet to expand in. Tobacco, in its early stages, has many enemies, in the shape of frost, insects, and caterpillars;

and instances have occurred in which three successive transplantings in one year have been ruined by one or other of these causes. After the third failure, the French usually despair, and plant hemp to lessen their loss; but the tobacco-grower has the consolation of knowing, that one successful season out of three pays. In September, the crop is gathered, and the leaves are hung up in covered sheds for six or seven weeks till perfectly dry and withered. In this state, tobacco is almost without smell, its peculiar aroma being produced by fermentation, for which purpose it is collected in heaps on the floor, and carefully covered with blankets for thirty-six hours or more, according to the state of the atmosphere. It is then pressed into hogheads with a powerful lever, which pressure has the effect of distributing the oil uniformly throughout the mass; and in this state it makes its appearance in the London Docks.

Here it remains in bond till the duty is paid, when any part that is found to be damaged is cut off, and burnt in a huge kiln, called the Queen's Pipe. For its distribution, there are, in the first place, in London, twelve wholesale tobacco-merchants, or brokers, to whom it is consigned; ninety manufacturers, who convert it into cigars, snuff, and the various sorts of tobacco for the pipe; and more than 1500 tobacco-nists, or general dealers. There are, besides, eighty-two clay-pipe makers. Mr Steinmetz calculates that, 7880 individuals in the metropolis are employed in preparing tobacco for the mouths and olfactories of its population. The cigar-makers are paid at the rate of so much per hundred; and a good workman can easily earn L.2, 10s. a week. In Hamburg, the manufacture is the most important branch of its trade; and 150,000,000 cigars are turned out every year. It gives employment to 10,000 persons; and a printing-press, with a numerous staff, is exclusively occupied in printing the necessary labels for boxes and packets.

Having traced the plant from the hotbed to the dock, let us follow it now to its eventual destination—the mouth of the smoker.

We will begin with cigars. On the tobacco being turned out of the hoghead, it is first damped, to make it pliable, and then sorted. The least likely-looking leaves are called *fillers*, and form the main body of the cigar; the second best go by the name of *lunch-wrappers*, and constitute rough envelopes for the fillers; and the finest, or *outsides*, are intended to catch the eye of the customer. The actual manufacture occupies but a few seconds.

After having been sorted, the leaves are deprived of their stalks by the *stripper*, and handed by him to the maker. That functionary picks out a bunch of wrapper, and cuts it into a form something like the stripe of a balloon; in this he rolls a quantity of filler, thus producing a rather disreputable-looking cigar; it is then cut to the required length; and, finally, he gives it an attractive appearance, by wrapping it neatly up in an unblemished outside, and fastening the tip-end with paste coloured with chlorophyll, to keep everything in its place. A drying-stove completes the operation.

Most of the tobacco for the pipe is cut into shreds by machinery. *Shag* derives its name from its rough and bushy appearance; *bird's-eye* is so called because small portions of stalk are mixed with it, which bear a fancied resemblance to the eyes of birds; *crowfoot* is a namesake of the American river; *commuter* was originally the name given in America to the baskets of rushes in which the tobacco was packed for exportation; and *pigtail* owes its appellation to its supposed likeness to the caudal appendage of the unclean animal. Its other varieties are like the advantages in an auctioneer's advertisement, 'too numerous to mention.'

In the manufacture of snuff, the stalks of tobacco are used as well as the leaves. The Scotch article is

imposed almost entirely of the former, while the latter predominates in *sappes* and the darker varieties. *riacc's-mixture*, and the whole of the 'fancy snuffs,' are scented to suit the taste of the customer. All these inventions are the result of accident. Newton discovered the law of gravitation by an apple tumbling on his head; the delicious flavour of roast pork was not made known to the world by a peasant whose pig had been burned down; and the peculiar and orchid odour of the celebrated *lundyfoot* snuff is said to be owing to the negligence of an individual who, the King Alfred, forgot to 'turn' the batch that had been entrusted to his care. Good sometimes springs from evil: the man got drunk, and made his master's tune.

Before the tobacco is ground into snuff, it undergoes process of *curing*—like bacon—which consists in its being moistened with salted water and other preparations. This mixture is called *sauce*, and each manufacturer has his own peculiar condiment, upon which the flavour of his snuff materially depends. After having been sprinkled with sauce, the material is heaped into bins, where much of the essential oil of the tobacco is driven off by heat and fermentation. It is then turned out and suffered to cool, when it is sent to the mills to be ground under heavy stones. Foreigners improve this custom by cutting it into grain with machinery, rasping it with a circular file, thereby avoiding the excessive friction which deteriorates English snuff, and interferes with its flavour.

Madame Pfeiffer relates that in Northern Sweden snuff is put into the mouth. In Iceland, it is applied to its legitimate receptacle, but in an extraordinary manner: 'Most of the peasants, and even many of the priests, have no proper snuff-box, but only a box made of bone, and shaped like a powder-flask. When they take snuff, they throw back the head, insert the point of the flask in the nose, and shake a dose of snuff into it. They then, with the greatest amiability, offer it to their neighbour; he to his; and so it goes until it reaches its owner again.'

The practice of taking snuff is said to have been introduced into this country from France after the Restoration; but the custom did not originate with snuff, as snuff is known to have been previously manufactured with herbs. In the matter of adulteration, the smoker has a decided advantage over the sufferer, as, out of forty samples of cut-tobacco examined by Dr Hassall, not one was found to be mixed with any foreign leaf or deleterious compound; whereas, in many of the nose-titillating 'mixtures' submitted to his inspection, he found a number of oxides, chromates, and bichromates that had no business there, including iron, red lead, amber, potash, and a substance that looked like powdered glass! The only adulteration of tobacco for smoking consisted in salt, sugar, and sugar—the two first being actually necessary in its manufacture, and the last being beneficial to the human frame, as smoking tends to diminish the marine constituents in the blood. The ingenious impositions vended at races and fairs by itinerant confectionists (?), who offer misguided youths 'a cigar and a light for a penny,' are of course made up of dyed and coloured paper. As a general rule, however, snuff, next to eggs, is one of the least adulterated articles of consumption we can boast of in these wretched fast-going days.

More than half of the learned counsel's work is devoted to the 'Influence of Tobacco on the Human System,' a subject on which I have neither space nor inclination to enter. There are one or two points, however, in his argument which I shall briefly notice. Dr Steinmetz, with laudable impartiality, exhibits a chemical analysis by Professor Johnson, that appears calculated to put an immediate end to smoking. It seems that when the leaves of tobacco are mixed with

water, and submitted to distillation, a volatile oil is produced, which, when applied to the nose, occasions sneezing, and when taken internally, gives rise to giddiness, nausea, and an inclination to vomit. When tobacco-leaves are infused in water made slightly sour by sulphuric acid, and the infusion is subsequently distilled with quicklime, a volatile, oily, colourless liquid, named nicotine, is produced, a single drop of which is sufficient to kill a dog. But besides these two volatile substances which exist ready formed in the tobacco-leaf, another substance, also of an oily nature, is produced when tobacco is distilled, alone, in a retort, or burned, as we do it, in a pipe. One drop of this applied to the tongue of a cat brought on convulsions, and in two minutes occasioned death. Of the truth of this analysis, which extends to a couple of pages, there can be no manner of doubt. Mr Steinmetz admits it himself, and acknowledges the correctness of the theory that may be founded upon it—namely, that if tobacco contains such poisonous elements, smoking must necessarily be injurious; but he asserts that, like many other theories, it breaks down utterly when applied to practice; in proof of which, he consoles his smoking readers by assuring them that he finished two cigars while transcribing the analysis.

Appropos of theories, this tobacco-loving barrister, while endeavouring to explain, with a profusion of jaw-breaking anatomical terms, the *modus operandi* of smoking, takes the opportunity, under cover of a cloud of such words as *pneumogastric*, *medulla oblongata*, *stylo-pharyngeus*, and the like, to start a theory of his own, from which, on national as well as personal grounds, I dissent *in toto*. Mr Steinmetz, who no doubt is possessed of an enormous proboscis, has the audacity to say:

'The larger the surface of the mucous membrane of the nose, the greater the activity of the intellect, or the anterior lobe of the brain; and without a well-developed nasal organ, there never was a well-developed intellect. The nose of genius in every age has been conspicuous, in every sphere of its numerous manifestations.'

This may be a very pleasant doctrine for men who, like Mr Steinmetz, have noses as large as pump-handles; but enjoying, as I do individually, a small but extremely useful olfactory organ, I beg to come forward on my own behalf, and that of the ordinary-nosed portion of the community in general, and offer an indignant protest against so monstrous a proposition.

I have not said anything in the course of this paper on the subject of *chewing*; but as this extremely unpleasant custom cannot with propriety be excluded from an article on the subject of tobacco, I shall conclude with an anecdote shewing that the habit, dirty though it be, is not unattended with advantages. Commodore Wilkes, of the Exploring Expedition, learned, in the course of a conversation with an intelligent savage of the Feejee Islands, that, on one occasion, a vessel, the hull of which was still visible on the beach, had come ashore in a storm, and that all the crew had fallen into the hands of the islanders.

'And what did you do with them?' asked Wilkes anxiously.

'Killed 'em all,' answered the savage.

'What did you do with them after you had killed them?'

'Eat 'em—good,' returned the anthropophagous, grinning at the remembrance of the horrible feast.

'Did you eat them all?' asked the commodore, feeling exceedingly unwell.

'Yes, we eat all but one.'

'And why didn't you eat him?' inquired the explorer, whose curiosity got the better of his horror.

'Cos he taste too much like tobacco. Couldn't eat him no how!'

There is no doubt that the individual who proved such a posthumous puzzle to the Feejee *gourmands*, owed his exemption from the fate of his comrades entirely to his partiality for pigtail. Enjoyers of the 'quid,' therefore, have the satisfaction of knowing that the juices of their favourite weed so completely saturate the tissues of their bodies, that, in case of shipwreck, they need be under no apprehension of ever being served up at a New-Zealand dinner-party.

IMPORTANT EMIGRATION ENTERPRISE.

We see by the *European*, New York paper, that at Albany they are organising a new association, called the *American Emigrant Aid and Homestead Company*, the objects of which are worthy of being made widely public. Hitherto, emigrants for the most part have betaken themselves to the wilderness, family by family, to spend their lives there, cut off from the comforts and conveniences of civilised life, and to die before they are overtaken by the humanising influences of society. It is the object of the company to reorganise emigration entirely: to tempt *bands* of adventurers, composed, if possible, of acquaintances and neighbours, to make the enterprise together, and thus bring society and its amenities with them into the wild, and provide themselves with a ready-made market for the produce of their industry. Such communities are to be composed of persons representing the social and industrial interests the colonists have been accustomed to at home: the clergyman, the schoolmaster, the artificer, the labourers of every kind—all are to be assembled for the general good; and thus the mere fact of their settling in a village will convert the before almost worthless land of the colonists into valuable property. The part the company are to play in this project is to furnish the capital; to purchase land cheaply, because in large quantities, and with cash; to erect the grist-mill, the saw-mill, &c., and generally make all necessary or attractive improvements; then sell allotments to the colonists, reserving, like the government, a section here and there for themselves. We lately printed a little article called *Emigration made Easy* (alluding to the through-ticket system of the great Canada Railway), but the scheme to which we now bespeak our readers' attention is *Emigration made pleasant and profitable*—emigration by which the adventurer forfeits none of his usual moral and intellectual privileges, and finds himself the master of profitable land by the mere fact of taking possession. All this, however, let it be said, is something in the future. These sanguine dreams can be realised only by talent, energy, and undiminished integrity on the part of the company.

PHILANTHROPY IN WINE.

The vine-disease has injured so much the production of wine in Portugal, that last year's vintage, as we learn from Ridley & Co.'s monthly circular, was virtually lost for commercial purposes, only 4000 pipes having been made. This state of things has given rise to a curious project, half-philanthropy, half-business speculation. Baron de Forrester has offered to take the vineyards of a parish in the Douro under his protection, on terms so favourable to the vine-farmers, that at first sight one is apt to regard him as a Quixotic enthusiast in good works. He offers to be at the trouble and expense of applying certain remedies to the plants, without demanding any return for his capital and labour, unless the vintage should be more than double that of last year; and even then, to be satisfied with one-half of the grapes gathered above that double quantity, and to be at the cost of gathering them himself. Should the proprietor prefer paying the expenses himself, the baron undertakes to furnish him with the remedy at cost-price, and to manage personally the operations, for one-tenth part of the wine made in excess of double last year's produce. He likewise claims the preference in the purchase of whatever wine the proprietor may have to dispose of at the market-price. Notwithstanding all this liberality, it is said that the native farmers have no faith in the efficacy of sulphur, which is

probably the chief part of the proposed remedies; while the English intend applying the antidote with the greatest vigour. Messrs Ridley & Co. are of opinion that if Baron de Forrester's overtures are listened to by the parish he has addressed, it will be the means of conferring extensive mutual benefits.

THE WEDDING-DAY.

O THAT my death-day were as nigh
As is my marriage-morn!
I marvel such a thing as I
Should ever have been born,
To sell my youth, my hope, my truth;
To be—what most I scorn.

It seems such long, long years ago
I had a little sister;
They laid her in her coffin lone,
And I stood there and kissed her;
But till this hour with its stern power
I felt not how I missed her.

She might, with cool and gentle hand,
Have quenched this life-long fever—
This aching brow have softly fanned,
And, though my sins might grieve her,
What would not she have borne for me
Who is so still for ever!

O sister!—dead so long ago,
Thou of the spirit calm—
Wave! wave! above my burning brow,
But once thy shining palm,
And gently pour, my spirit o'er,
One drop of Heaven's own balm.

Sweet seraph! when we meet at last—
Thou, with thy radiant brow;
Mine, seared with records of the past,
And that forsaken vow—
This withered heart in shame would start
From aught as pure as thou.

Oh! the true hearts I might have fled,
Even to their inmost fold;
The loving spirits I have chilled
With haughty words and cold;
And now for wealth I sell myself,
A little glittering gold.

And more! O! more torment me not
With those reproachful eyes,
Shewing what might have been my lot—
Stars of the past, they rise—
Enough of care have I to bear,
Without such memories.

Alas! I feel 'tis vanity
To rail against my fate,
For God hath given high gifts to me,
To make me good and great;
But I have sold the peace of old
For a little worldly state.

No more!—from all these idle words
But little help I borrow;
Proud thoughts have fled like summer heat,
And left me to my sorrow,
And this grief-stained brow; but still
Would be a sin to-morrow.

PRICE 1½d.

COMMON SENSE.

'THE Popkines have a good deal of talent about them, but they have no common sense,' is the verdict universally passed upon our family; and it is a just one: everybody says so; and what everybody says—it stands to common sense—must be true. The virtue expired with a certain clerical ancestor of ours, a sort of vicar of Bray, who under the Houses of Cromwell, Stuart, and Hanover, was never out of favour with the reigning powers, and who at last, like a jolly fat canon as he was, went off peaceably in his stall. He could 'seek the Lord' with armour on, perform the lighted candle and genuflection business, or vex the soul of the *Arbians in siccio* of the period with Protestant oratory, all equally well. He was a man of the strongest common sense, and died worth L.30,000; and 'Where would you be without him?' is a remark I have frequently made to members of my family, when they have been inclined to question his principles. It is quite certain that none of his descendants would have ever made that money: his second son was put in a madhouse, and ended there, because he was always experimental—tossing with fire and water, and persisted in asserting that carriages could be moved without horses; another member of his race proposed to keep off small-pox by means of the intervention of a cow; and a third spent a good deal of his time in building a room to sit in under water. There was a good deal of a certain sort of talent in all these persons; but what is so much to be regretted is, that what they did was contrary to common sense: the world never forgave them for it to their dying day. My father, who might have stepped into a family living of L.800 a year as soon as he left college, chose instead to join a marching regiment, and live in that, upon L.90 per annum besides his pay, because he had religious scruples. Now, in the first place, all scruples are foolish; and religious scruples are worse than foolish—they're wicked; and in the next place, the living actually went out of the family! What harm would my governor have done to it? He was not an infidel—he was not a Radical—he was not a grossly immoral person; he would have hunted, I suppose, and shot, and fished—occupations which he might have pursued in, very naturally, more than in anything else in the world—and as for visiting the poor people, which it seems, he considered himself unfitted for, he might have got a curate to do all that, paying him very handsomely, and still receiving L.740 out of the living. He could have bought most excellent wine—and it stands to common sense that these things are much better than what one makes for himself; and—But in fine, he lost everything and did

nothing, all through having scruples, or, which is the same thing, from the want of a little common sense. With all my regard for the governor, it positively makes me mad to think of what he threw away; not only the actual advantages, but the chances. Why, with our connection—I've got two first-cousins in the House of Peers, and our arms are the same as the Premier's—he might have been made a bishop, or even an archbishop—who knows?—the spiritual shepherd of the Church of England, with six-and-twenty thousand pounds a year! But then, he never could have said '*Nolo Episcopari*,' for he had not the common sense for it.

Then my mother, she was my father's cousin, and a regular Popkins. At twenty-one years of age, and one of six, she refused Sir Tattenham Leger, a man who owned half a county, and was indirectly connected with the royal family. Are you and I, my Public, going to believe that any reasons, any possible circumstances, could have justified such conduct as that? I put aside the direct injustice done to myself; but was it the right thing for any woman to do, who contemplated the possibility of ever having children? What had she to urge against the man? His age? His somewhat convivial language? The absurd story of his having broken the hearts of his two former wives? The haughtiness which rather became a person of his rank and influence than otherwise? Nothing of the sort. 'I love dear cousin Henry, and he loves me,' that was her sole objection; and my uncle—Percival Popkins—positively let her have her way. Now, only mark the consequences: the baronet was seventy-five, and died the very next winter. Why, in the name of common sense, didn't she marry him first, and my father afterwards? She would then have had a title, a park, and a town-house. As it was, my beloved parents lived in barracks, and in barracks was the writer of this paper born. I positively believe that sometimes in the course of their wandering, and while my father was a subaltern, a curtain drawn across the apartment formed the sole partition between their sitting-room and bedroom. Now, is there a human being endowed with common sense who believes that love, or indeed any other mere sentiment whatever, could have compensated for such a position as that?

When my grandfather died—who had changed his name for that of Walker, and who was, I am thankful to say, the director of a joint-stock bank—we came into a property, and my father sold his commission. And how did Captain Popkins do that? By giving out that he was quite undecided about leaving the regiment, but was ready to go if the juniors made it worth his while? By getting an extra three hundred or so

out of the first purchasing lieutenant, two hundred out of the next, and so on, with nice little pickings from the first purchasing ensign, in the usual way? Quite the reverse! he sold his captain's commission—if you can believe such madness—for regulation-price! Why? Oh, don't ask me, or I shall lose my temper: the high-flown considerations upon which my father acts, are, I am happy to say, quite out of my range of vision. I am no genius, thank goodness, but I do think I have a little common sense; I think I know the world; I believe I know the value of money. The idea of a man sinking L30,000, as my father did, in the funds and an estate in Westmoreland!

'Why, sir,' said I in remonstrance—for I know, I hope, how to be respectful to a parent, whatever may be his follies—'in these railway-days, you might double, or at least make ever so much more out of that money.'

'I don't want any more, Bob,' answered my father.

Now, think of a person, sane, or at least not in confinement, openly avowing that he did not want any more money!

'Sir,' replied I, with a little of that tact which—perhaps partial—friends have generally allowed me to possess, 'I was thinking of your responsibilities. Consider how much more good you might do with double your income!'

Sometimes—I never can quite account for it—when I am talking to the governor, there comes over his face just such an expression as a very clever fellow might wear when a second-rate man is trying to do him, and he wares it just then very decidedly.

'Do you think that likely, Bob?' said he sily. 'How much do you spend a year in the practice of benevolence?'

'Sir,' replied I—and I felt somehow hot all over—'I hold the indiscriminate charity'—

'Stop, Bob,' said the governor interrupting; 'we won't enter into that subject. If I were to double your allowance, do you think you would spend twice as much in doing good? You seem to have a doubt about that; so have I. If the reason you urge in favour of speculation be valid—though most speculators, I am afraid, Bob, are far from having such noble aims as you—ought not the recipients of our present bounty to be consulted before we risk their interests? For, if we fail, they fail; and when we succeed, Bob, we may sometimes forget to pay them their full dividends. You know we read that it's very hard for a rich man to enter into the kingdom of heaven.'

'Well, father,' said I, 'I am sorry I spoke to you.'

Nothing gives me such a tremor—for my disposition is naturally reverential—as to hear the Scriptures referred to in the affairs of this world. I always attend my parish church, I hope, every Sunday, wet or fine, and listen to all the clergyman has to say; but it's not a layman's place, that's my opinion, to go preaching and teaching to people out of the Bible upon weekdays. It has the very worst effects upon the lower classes, I'm confident; for I knew a tinker once who held the abominable doctrine, that one man was as good as another, and who had the blasphemy to tell me that he learned that for himself out of the New Testament. Of course there are expressions in it, here and there, about rich men and so on, but it stands to common sense that one isn't to take them literally. The idea, for instance, of it being my duty to give a half-naked fellow on the road one of the great-coats I'm sitting upon, is simply preposterous. What becomes of the rights of property? What becomes of political economy? What becomes, I should like to know, of common sense itself? Why don't my governor—if it comes to that—give all he's got to the poor? Why don't he cast his last shilling into the treasury, like the poor widow in the parable—which was a pretty example of political economy, by the by—and let us all

come upon the parish at once? That would be being consistent, that would; and consistency I hold to be the very next best thing to common sense.

I hope I am a better Christian than to call my brother John a fool; but I can't help having my own opinion about him for all that. He and his wife are absolutely living—no, existing—upon L250 per annum in a cottage close to my father's house. I think I know my duty to society, to the circle in which I move, better than to propose to any woman unless I have a thousand a year to offer her, at the very least. I feel my responsibilities, I trust, sufficiently strongly not to dream of asking her to live in the country unless I could keep her a carriage and pair. Even on the excellent salary I am now receiving at the Bank, I calculate that I shall not be in a condition to fall in love until I am fifty, but shall then fall in love immediately with some person of property and connection; by that time, John will have had six children, and have sunk in the social scale two degrees at least. It is of no use for him to say that he does not care a fourpenny-piece for the social scale, because that isn't common sense. A man may say that he likes beer better than wine (John does); but I am not going to believe him any the more for that: that's what I tell my brother John—for it's hard if one can't say what one likes to a younger brother with L250 a year, and a family too—whenever he tries to humbug one.

'Liberty and the beauties of nature,' said he upon one occasion, 'make up to me for the absence of all luxuries which I could procure only at their expense. You don't appreciate my pleasures—pleasures is a fair word for them—any more than I appreciate yours, Bob.'

I knew what he meant by all this; he meant lakes and sunsets, and mountains, and birds, and books—in a word, what is called poetry. Now, I have read *Lally Rook* myself—for I have always made it a point to be well informed—and I own that that sort of thing is pretty enough; but the idea of poetry having anything to do with real life!—that's where John shews his utter disregard of common sense. 'Now, poets'—this is what I told him—'never possess any: your geniuses are for ever in jail, John; every sense but common sense, that's what all you fellows have.'

'We have common sense, too,' replied he, as cool as a cucumber; 'and if we could derive a satisfaction from the results of a clever stroke of business, more piquant perhaps by the least tinge of dishonesty, not only equal to that experienced by—no offence—yourself, Bob, but with a considerable margin of pleasure in addition as recompense for what would be to us uncongenial and prosaic, not to say dirty, work, you would, I think, find us rivals quite the reverse of despicable both at change and market. You know how the Greek trades-people suffered, notwithstanding their well-established adulterations, when the philosopher of old set up his shop, to prove that he could be a man of business.'

'Oh, confound it,' said I, for I am none of your argufuers, 'if metaphysics is your game, I'm off; but just answer me this: was there ever a poet yet who kept his own accounts, and left off in the world a better man—I mean, of course, a richer—than he began?'

'The majority of them,' answered he, lighting his pipe, 'have most certainly done so; a number of them, you will allow it, have even shewn a common sense above the common, in living all their lives on other people's expense; many of them have been remarkable for their business habits—William Wordsworth, for instance, and Robert Southey, who both lived within ten miles of this cottage-door, while Mr Samuel Rogers was a banker: think of that, Bob! Shakespeare, I believe, had much more common sense than Baron Rothschild.'

'Come, John,' cried I, with a burst of laughter

perhaps, after that, you'll have the kindness to tell me what common sense is?' And this was his reply.

'Common sense, Bob, is the sense, as its name implies, which is common to everybody, and its office to us, according to general opinion, is to watch over and provide for our own interests and happiness. Men of striking intellect, of all sorts, possess, I believe, this quality in greater proportion than ordinary people; these latter, however, being by far the most numerous, greening among themselves upon what are the objects to be desired in life, and perceiving the others to be striving after and delighting in quite different things, are inclined to deny them common sense; thereby making themselves judges of the interests and happiness of natures confessedly higher. Moreover, the vulgar, having thus flattered themselves that this quality is peculiarly their own, and possessing for the most part little other sense beside, are wont to exalt common sense to a most ridiculous degree.'

'Oh,' said I, 'since you choose to get rude and personal—which is a thing I particularly object to in all argument—'I shall certainly not prolong the conversation.'

NATIONALITY.

WHAT is nationality? Is there a distinct nationality for Scotland, England, Ireland? Are the inhabitants of England and Scotland—of Lowland Scotland at least—one and the same race, with hardly any appreciable difference, or are they two perfectly distinct peoples? It may not be uninteresting at the present time, when this subject is so much discussed—meeting us in every newspaper, and forming so frequent a topic of conversation—to take a calm review of the matter; to see what ethnology, that clearer up of the history of nations, has to say about the business. A slight sketch of the history of the population of the two countries, if it does not enable us to settle the question to our satisfaction, may help us to a better understanding of it—may keep us from a good deal of error, and may prevent us talking a considerable quantity of nonsense.

To begin, then, with the beginning: Who were the people who first colonised the islands of Great Britain and Ireland? The answer to this question does not admit of much dispute: it was the Celtic race—the first of the Indo-European family in Europe. If there was a *Præ-Celtic* people in Britain—an extension of the Finnic or Allophyllian race—which is doubtful, it does not affect the present inquiry. It is sufficient for our purpose to commence with the Celts as the earliest inhabitants of Britain. Without going further back for the origin and seat of this race than the shores nearest to our own, it is enough to say that Britain received its earliest population from France and Belgium; that at two distinct periods it received colonies from the two great branches of this family—the southern or Gaelic branch from France; the northern or Cymraeg branch from Belgium. The Gaelic or Gaelic branch appears to have been the earliest colonists, and probably spread over the whole of South Britain; but pressed upon by the next migration—that of the Cymri, they were eventually driven north and west. One portion, driven beyond the rivers Clyde and Forth, took refuge in the extreme northern part of the island, which received the name of Albyn; the other took their way through Wales, from whence they passed over into Ireland. The Cimbri, Cymri, or Cymraeg, then spread themselves over the greater part of Britain. They were the ancient Britons, whose descendants, the Cambrians, or Welsh, still exist in Wales, Cornwall, and more mixed in Cumberland. They probably also spread over the greater part of Scotland, encroaching upon the ancient kingdom of Albyn, and pressing upon the Gaels, drove

them into the extreme Western Highlands. The Cymri in Scotland were identical with the ancient Caledonians or Picts. The northern portion of our island may, however, have been colonised by a direct migration of the same race, coming into it by sea from nearly the same quarter—Jutland—and not indirectly by the way of England. There are, however, some historians who maintain, chiefly on the authority of a passage in Tacitus, that the Caledonii or Picti were not Celts at all, but Germans, or rather Scandinavians. In this we cannot concur. The Picts or Caledonians were Celts of the Cymric branch, and closely allied to the Welsh or ancient Britons. The proofs of this rest upon the affinities of their languages, to be seen in the names of particular localities within the Pictish and Cambrian areas, which they still bear.

So far, then, the original population of England and Scotland rests upon nearly the same substratum—that of the Cymri or ancient Britons. That of Ireland is somewhat different, having a Gaulic rather than a Cimbric origin. The Gael is better known in Ireland under the name of Erse.

After this first colonisation by the Cymri, there was the Belgian immigration, which was chiefly confined to the southern shores of South Britain. These drove the Cymri further north into the interior. They were the men who opposed Cæsar on his expedition into Britain. The Belgæ, however, although more civilised, from having left their centre at a later period, were of the same family with the Cymri who had preceded them, both being of the same northern branch of the Celtic family.

We have next the Roman Conquest, introducing, during an occupation of four hundred years, all manner of heterogeneous elements: besides the pure Italians, there were in the legions Germans, Sarmatians, Moors from Africa, and much more besides. Long as was the Roman occupation, it produced but a partial change in the blood of the population. The Romans, to do them justice, were conquerors, not exterminators, like some of the races that came after them. Partial as it was, it was confined chiefly to South Britain. Their departure left two distinct populations in Britain—the original and pure Celtic population, and the Romanised Celts; the latter in the large towns and their immediate neighbourhood, the former constituting the rural population: the first demarcation between town and country thus early established, and felt even to the present day—good old country families *versus* upstart town-folks.

Passing over for the present the invasions of South Britain by the Scots and Picts, which were merely temporary raids, not altering the population, we come next to the Saxon or Teutonic invasion—differing, however, in its own ethnological character, and far from being one and indivisible. It consisted of two broad and well-marked divisions: the Saxons, properly so called, with Jutes and Frisians, in South Britain, south of the river Humber; and the Angles, more Scandinavian than German, occupying Britain from the Humber to the river Forth. The Saxons drove the Celtic Britons into Wales and Cornwall, or completely exterminated them. They refused to mix with them. The Saxon race, therefore, south of the Humber, were a purer race than the Angle colonisation north of that river, having less of the Celtic substratum than is to be found in any part of the kingdom. Their occupation of a country to the nearly total extermination of the original inhabitants, is one of the most complete in history. Still, even here there must have been some Celtic substratum, from the conquered Celts being retained as slaves and serfs; and considerable traces of the Celtic language can be shown to exist in our Saxon English, although slight as compared with that further north.

The Angles, settling north of the Humber, drove the

Celts into the wilds of Cumberland and Westmoreland; and extending across the Tweed as far as the Forth, conquered and intermixed with the original Celtic population much more than their allies did in the south. The Celts (Picts) of Lowland Scotland, who refused to submit to the conquerors, gradually drew off into the west of Scotland, where they founded the kingdom of the North Britons or Strathclyud, which extended from the Clyde to the Solway Firth, the most northern limit of which was Dumbarton. Those of the same race on the south of the Tweed, retired into the mountainous district in the west, and established the Celtic kingdom of Cumbria. Both of these maintained their independence for a considerable period.

The element superimposed upon the Celtic north of the Humber was Scandinavian rather than German, Angle rather than Saxon; and the dialect introduced was a branch of the Scandinavian rather than of the German spoken further south. Lowland Scotch is not, as has been frequently supposed, a dialect of the English; it was an offshoot from the Scandinavian family of languages, just as the English was an offshoot from the German branch. The large number of words peculiar to the Lowland Scotch, and which are not found in the English of any period, are Scandinavian, closely allied to the old Norse of Norway, still spoken in Iceland. The Angle belonged to that branch; the Saxon, to the Southern or Proper German.

Caledonia or North Britain after this received a fresh influx of Celtic blood, this time Gaelic rather than Cymric, Erse rather than British—the Dalriad Gaels from Ireland. These settling in the west of Scotland, conquered and incorporated the ancient Gaelic race, of the same family with themselves, who had been driven into the extreme west by the Cymric Picts. Establishing themselves firmly in Argyleshire, these Dalriad Gaels, from that *point d'appui*, extended themselves over the Pictish portion of the island, and gradually conquered, coalesced with, and absorbed the Cymric Picts or ancient Britons, who cease to appear as a distinct people. This union of the Cymric Picts and Dalriad Gaels formed at one time the bulk of the population of the north and west of Scotland—of all, indeed, except the Angle kingdom of Lothian on the eastern side of the island. These Dalriadic Gaels were called by their neighbours, Scots or vagabonds, and eventually gave their name to the whole of Caledonia, which after this ceases to be used except in poetry; and the northern portion of the island came to be known as Scotland.

It was an amalgamation or absorption of the two branches of the Celts, the Picts or Britons with the Gaels—not a complete conquest, far less an extermination. The Picts or Cymri lost their identity or nationality in that of the Gaelic Scots; hence the difference between the Scottish and the Irish Gael—the former, a mixture of Cymri and Gael; the latter, pure Gael. The Welshman, again, is pure Cymraeg.

Such as it was, it had no effect upon the blood of Lowland Scotland, or upon its language; both remained what they had been since the Angle invasion, chiefly Scandinavian, based upon a British or Cymric substratum.

And now comes one of the most important crosses in our breed, introducing a new element into the blood of the nation, which has raised the United Kingdom to her high position as mistress of the sea, and converted the sluggish Saxon and somewhat heavy Angle into the enterprising Englishman and Scotchman—without which the Englishman might have remained as unenterprising as his parental Saxon, as little a maritime people as the Germans are to this day. This new element was the Scandinavian—Norsemen or Norwegians in Scotland; Danes in England. The mighty and enduring nature of this great colonisation

was hardly appreciated by ourselves, until it was pointed out by Worsaae, a Dane.* Our histories had made us acquainted with the frequent invasions of Danes and Norsemen, but treated of them rather as partial inroads, carrying fire and sword through the land, than as great and permanent colonisations which effected a radical change in the blood of the population. History told us little more than of the rise and fall of dynasties—it took no note of the entire change of the people. These two different nations, the Danes and Norsemen, are generally confounded, both in tradition and history, under the common name of Danes. The complete conquest of England eventually by the Danes, and the subsequent union of Norway and Denmark, appear to have led to this confusion.

The Norsemen, Norwegians, or Vikings, conquered the north of Scotland—Caithness and Sutherland; hence its name—Sudreland, the most southern portion of the Norwegian possessions on the mainland, and afterwards extended over part of Ross-shire; the Orkney and the Shetland Islands; all the western islands,† including the Isle of Man, with a portion of the mainland, Cantyre, &c. These they ruled over for centuries; at one time imposed upon them their language, and displaced the Gaelic, though it again, in its turn, resumed its place after the fall of the Norwegian rule. In Caithness, however, the Gaelic was not again spoken, the population there being eminently Norwegian; and in Shetland and Orkney, Norse continued to be spoken till displaced by the English. In Shetland, it has only ceased since within the last hundred years, and the language yet retains many pure Norse words. This conquest has left numerous traces of its occupation in the names of bays, firths, rivers, and promontories of these countries, which they still retain. The word *firth*, from the Norse *fiord*, so common in Scotland, and unknown in England, marks the Norwegian occupation. The alteration in the blood of the people was no less remarkable. The under-sized Celt grew into a finely developed Norseman: instead of dreading the sea, and paddling along its shores in a miserable leathern coracle, he became a bold seaman, although he has strangely forgotten or perversely ignored the source from whence he derived this superior development of frame, his blue eyes and light hair, and straight limbs, instead of the bowed legs of his ancestors. The blood of the eastern coast of Scotland was even more completely changed by the Scandinavian conquest—here Norwegian-Danish, rather than pure Norwegian—and the fine sea-faring population along the eastern shores of Scotland, attest the improvement effected upon the breed. The greater number of names borne by that population, and ending in *son* (the Danish *sen*), are of Norse extraction: Swanson (Svensen), Manson (Magnusen), Henderson (Henricsen), Duncansen, &c. Johnson, one of the commonest names in England, is also very common in Iceland, both coming from the same source—Norway. Ronald and Ronaldson have the same extraction (Ragnvald).

The Celt or Gael was either completely incorporated with the Scandinavian conquerors on the sea-coast, or driven into the interior, where he took refuge in the fastnesses of the Highlands. A pure Celt in Scotland, if he exists at all, is only to be looked for in the Central Highlands.

No less marked and lasting was the effect produced upon the population in the north of England by the Danes. Northumberland, Durham, Westmoreland and Cumberland, Lancashire and Yorkshire, were the great

* *The Danes and Norwegians in England, Scotland, and Ireland.* By J. J. A. Worsaae.

† The Norwegian kingdom in the Hebrides was called the Sudreyjar or Southern Islands, as that in Orkney and the Shetlands was the Nordreyjar or Northern Islands. From this appellation of the Hebrides came the title of the Bishop of Suder and Man.

area of the Danish colonisation—an historical fact, indeed, but one amply corroborated by the characters, physical and moral, of the people themselves. The south of England, afterwards conquered by the Danes, and forming for a time a portion of their dominion, was held more as a conquest than as a permanent colonisation, and had its population little altered, although a considerable infusion of Danish blood took place along the whole eastern coast. The Anglo-Saxon race owes much of its bold spirit of enterprise, its love of freedom, and its maritime skill and daring, to this Danish strain.

Last of all comes the Norman Conquest, introducing the Frenchified Scandinavian—that wonderful race of men, half Norseman, half Celto-Frank, sprung from a band of adventurers from the shores of the Baltic—Norwegians, Danes, and Swedes, who had settled in the west of France, and conquered Normandy. Here, intermixing with the native French, they compounded a race that at one time threatened to overturn Europe, and has given kings to half her thrones. Being comparatively few in number, and marrying French women, their descendants appear in a generation or two to have abandoned their native Norse for the language of their adopted country. Conquerors of England, the ethnological effect of the Norman Conquest was at first upon the higher ranks rather than upon the mass of the population—upon the nobility rather than upon the people. In time, however, it circulated through the whole body, and this cross has no doubt exercised an important effect in improving the Saxon race, and raising it to its high pitch of perfection. The Danish portion of the kingdom, that north of the Humber, offered the most strenuous opposition to the Normans, and was the last to submit to their rule. It was this great split of England into two sections, the Anglo-Dane and the Saxon, that facilitated the Norman Conquest. Partial as it was in its effects upon the general population, from the small number of the conquerors, it has produced an important alteration upon the ruling families both of Scotland and England. Most of the English nobility date the foundation of their families from this race. The immediate effect upon Scotland of the Norman Conquest was sending a large portion of the Saxon and Anglo-Saxon population from England into Scotland. Malcolm III. of Scotland had married Margaret, a relation of Edward the Confessor, and sister of Edgar Atheling, the heir of the Saxon line in England. To her court flocked all the Saxon nobility who refused to submit to the Norman rule. Many of the Normans, discontented with their lot, or in search of new adventures, followed at a later period. From these two sources, many of the chief families in Scotland are descended; and a host of names, considered to be good Scottish families, are borne by the descendants of these Anglo-Saxons and Normans. Bruce, the Stewart race, the Sinclairs (from the Norman St Clair), Gordon, Hamilton, Ogilvy, Murray, Drummond, Hay (De la Haye), Fraser (De la Friselle), and a host of others, are all of Norman extraction. The head of the Campbells, the Argyre family, are of the same race: Beauchamp, or Campo Bello, a Norman, married the heiress of Awe, daughter of Sir Colin of Awe, and changed her name and that of all her clan to Campbell. Before that time, the clan had borne the name of their great founder, Sir Colin More, or Colin the Great, and were called the sons of Colin, or, by the Irish, M'Callens. The Douglasses, on the other hand, were a Flemish family; while some of the present Highland, or so-called Celtic clans, are descended from the Norwegian conquerors. The MacDougals and Ronaldsons are descended from one of the Norse vikings, Jarl Somerled, who, in 1156, made himself master of all the Hebrides, from Mull to the Isle of Man, and a portion of the mainland of Scotland. He left two sons. Dugal, the

younger, succeeded to Argyre and Lorn as his patrimony, and founded the clan or family of MacDougall; while the eldest son, Ragnvald or Reginald, obtained Cantyre and the islands: from him sprung Clan-Ranald and the family of the Ronaldsons.* The MacLeods of Skye are the descendants of another of these Norse vikings, and still use the family name of Torquil. Norman is also a favourite family name of the MacLeods.

These men soon identified themselves with the people they conquered. Amongst the Celtic race, they adopted the dress and even the language of the Celts, became completely assimilated with them, and are afterwards found as heads of Highland clans. Hence we have the Scandinavian and Norman clans of Sinclair, Stewart, MacDougall, &c., their descendants considering themselves Celts. Nor is this to be wondered at. It appears to depend upon a principle of our nature. Alexander the Great gave mortal offence to his Macedonian followers by adopting the dress and habits of the barbarians he conquered. The Norwegian king, Magnus, surnamed Barfod or Barelegs, who made himself master of the Hebrides (A.D. 1096), had this sobriquet given to him by his Norwegian subjects from his adopting the kilt, and as Barelegs he stands upon the roll of history. Conquerors, if few in number, and especially when they intermarry with the conquered race, generally end by adopting the habits, dress, and language of their subjects.

In Scotland, so strangely has the ethnological history of our race been forgotten, that Lowland Scotsmen are apt to forget their origin, and claim for themselves the history and traditions and fame of the race they conquered. Descendants of Angle invaders, Norwegian vikings, Saxon lords, and Norman barons, have donned the tartan, and taken their place among the Highland clans. It might be dangerous to tell a MacDougall that he was the descendant of a Norwegian pirate; or a Bruce, a Stewart, or a Sinclair, that they were sprung from Norman adventurers—men who swept the unfortunate Gael before them in their mail-clad strength, drove them into the fastnesses of the mountains, or ruled over them as serfs with a rod of iron. Our own fascinating novelist has, more than any other, tended to increase this unhistorical confusion—for these times are so completely within the historical age, that they cease to belong to the more uncertain realms of ethnology—and has appropriated for his own race the fitful and transient victories the Celts gained from them. In our own day, patriotic Scotsmen often claim for their Teutonic fellow-countrymen all the renown gained by our Highland regiments, supposing they were really composed of Celts, which, however, is more than doubtful.

This may be taken as a tolerably correct outline of the ethnology of Great Britain. The difference between the two sections is not so broad as some may have imagined; neither is it so close as others have maintained. 'It is not so broad as a church-door, nor so deep as a well, yet it is enough.' We see that there is a considerable difference of race between the Englishman and Scotchman; that although the Lowland Scotsman is not a Celt, and far nearer akin to the Englishman than he is to his Highland fellow-subject, yet there is one great distinction of race between the two people. In the Scotsman, the Scandinavian element preponderates; in the Englishman, the German. The old grudge between these two branches of one great stock, shews itself in its original area. It is constantly breaking out in Holstein, where the two elements are ever jarring—the German *versus* the Dane. It is this that separates the population of our island into two races, differing in dialect, habits, and

* Worsaae.

customs; but, above all, in their mental temperament, in their ideas and modes of thinking, looking often at the same subject from two entirely different points of view.

Ethnologically, the people of Great Britain consist of three, if not four, varieties of man—the Norman-Saxon, south of the Humber; the Angle-Norwegian-Dane, north of that river; with the Celtic (Cymraeg) population in Cornwall and Wales; and the Celto-Scandinavian in Cumberland and the Highlands of Scotland. Where, then, is the true Englishman to be found—the Angliar, properly so called—the man from Angleland or Jutland, whose race or breed is identical with his name? He will not be found in Saxon England, or England south of the river Humber—except in Norfolk and Suffolk, where the Angles also settled and founded the kingdom of the East Angles—but north of that river, between it and the rivers Forth and Clyde. The Scotsman, again, if race and name were synonymous, exists only in the descendants of the Dalriadic Gaels in the Western Highlands. Politically, these different people formed the two kingdoms of Scotland and England, the river Tweed separating the Scotsman from the Englishman. How, then, came this distinct nationality, separated by the Tweed, to arise? How came the Angle-Saxon-Norwegian, north of the Tweed, to separate so broadly, not only from the Norman-Saxon south of the Humber, but from the Angle-Saxon-Dane south of the Tweed, almost identically of the same blood with himself? The truth is, there appears to be a nationality that springs up independent of blood or pedigree. A political nationality may become stronger than an ethnological one. Separated by political boundaries, the men on the two sides of the Tweed, sprung from one race, in time grew into two people strongly opposed to each other. The Angles south of the Tweed, separated from their own nearest kinsmen north of that river, and joined politically to the Saxons south of the Humber, soon came to entertain feelings of intense hostility to their brethren on its northern banks. The men north of the Tweed, 'Celt and Angle, Saxon exile and Norman adventurer, grew and welded into one distinct nationality,' which reserved its greatest antipathy for its nearest neighbours—those who were most nearly allied to it by blood, as well as nearest to it in position. The moss-trooper north of the Tweed did not stop to inquire into ethnological affinities when he harried the lands of Northumberland; nor did the Northumbrian rough-rider feel any remorse of conscience when he plundered his brother-kinsmen in Roxburgh or Berwickshire. Mutual injuries, wrongs, and offences, soon rendered the animosity springing up between these near relations intense and enduring. And this is just what generally happens with sections of the same people politically separated. The Frank on the west bank of the Rhine came to regard the Franks on the eastern bank with far more jealousy and dislike than he had for people further from him, from whom he had received no injuries.

Nationality, then, is a something that may spring up independent of blood or race, and is soon formed by isolation, and in a few generations will impress upon a people an indelible character that no time can remove. As soon as a nation or portion of a nation, a tribe or section, or even a cluster of families, break off from the main stock, and become in any degree isolated, they take a form of development peculiar to themselves: their language, if it was originally one, separates into two different dialects, which in time become mutually unintelligible; the physical characters undergo a change, and they acquire a peculiar and distinct physiognomy. This is much influenced

by climate, latitude, altitude, by the nature of their food—its abundance or otherwise—and the habits of life induced by the different modes required to procure their sustenance. Hence, the fertility of the soil, or its sterility, will exert a powerful influence in forming the character. No less are the mental faculties acted upon by external agents, and directed into different channels. The inhabitants of a mountainous region differ from the dwellers in the plains frequently as much in mental temperament as in physical features. The result of all this is, that, in a very few generations, the characteristics, physical and moral, of individuals become stamped upon the whole community, and a distinct nationality is produced, with habits, customs, feelings, language, laws, and government peculiar to itself. Wars spring up between the people so separated; national animosities soon arise, and widen the breach yet further. The Scandinavian and the German are themselves originally of one great stock—the Teutonic; though now so widely apart, and perpetuating their rival discords through their descendants. The Jews, with their distinct nationality, which they have preserved through all reverses to the present day, developed that nationality amongst nations closely allied to them in descent and language. Of the same race with the Canaanites, Philistines, Moabites, and Ammonites, &c., speaking the same language, or a closely allied dialect, and separated by the one element of religious belief, how intense became their antipathy to each other, which ended only with the extermination of the one by the other. In America, we have the same thing being repeated before our eyes—a nationality already complete, distinct, peculiar: sprung from the Anglo-Saxon race, how widely have they already departed from it, even in features and physical characters—still more in mental temperament; and already do we see this people of one race splitting into two great branches, the northern and the southern, placed in antagonism to each other, and developing in two most opposite directions. Language does not alter so readily nor so rapidly in these days, when it is kept more stationary by means of books, as it did in more remote times, when it was transmitted orally from father to son; yet, even in America, we can see traces of a new dialect being formed. The more remote and isolated a nation is, however, the less does the dialect alter. The people of Iceland still speak the Norse of the ninth century, while the parent state, Norway, has greatly modified its language.

Nationality is simply the growth or development of any section of a people into its own peculiar form. It is much assisted by community of race; but it will often take place in spite of it, or in opposition to it, and sometimes in a most perverse form. In Ireland, the men who have always been loudest in their outcry against England, and strongest in their hatred of her, were not the unfortunate Celtic people whom the Anglo-Saxons had conquered and tyrannised over. No; they were the descendants of the Earl Strongbow and his English conquerors, who had settled in Ireland. Daniel O'Connell himself was more of a Saxon or a Norman, than of the ancient Irish or Celtic stock. The abuse of the Saxons is a favourite subject with all the Celtic races, who call all Germans by this name just as the Germans apply the term *Welsh*, *Wallach*, *Wallach*, to all foreigners, Celts, Romans, &c. But after all, Ireland received no injuries from England, so long as England was Saxon. It had been indeed conquered in part by both Norwegians and Danes, but it was not until England had become Norman that the English invaded Ireland.

Nationality seems to be a great law of the human heart. It cannot be upset by argument: it may be illogical, is frequently absurd, but it is a great fact. A universal brotherhood is a dream of philanthropy.

* The late Hugh Miller, in his *First Impressions of England*, remarks on the strong similarity between the Lowland Scotch and the population of the north of England. It was not until he had got into Saxon England that he felt he had come amongst a different race.

is never has existed, and never probably will. National antipathies never entirely wear out, however closely nations may become united. Nothing is more easy to show than that Englishmen and Scotchmen are sprung from nearly one and the same people; speak nearly the same language; and politically united, are one, or should be one, indivisible unity. Nothing is more certain than that they are two, with different characters, different ideas, different idiosyncrasies, different religions, or forms of religion, to which each are strongly and sincerely attached. Even in France, where the national fusion into one whole is perhaps more complete than in any other nation composed of so many diverse races, there are some broad lines of demarcation yet to be seen. The peasant of Normandy still shews in his sea-faring predilections his Scandinavian origin, and differs widely from his Celtic fellow-subject in Brittany, and still more from the Iberian Gascon south of the Loire.

The Scotch and English are as much united as two people so different can ever be; and he who would force them into a closer union, will only separate them more widely. Like two horses unaccustomed to run in double harness, if braced up too tight, they will begin to kick and plunge; but if allowed to run free, they may pull pretty well together. Let them remain, therefore, as they are: two branches growing out of one stem; apart from each other, yet belonging to each other; strengthening by their union the great trunk from whence they have both sprung.

ONE OF THE JEAMESES.

SEASONS of war, of civil strife, and of public tumult, often draw forth the best, as well as the worst qualities of human nature. The names of heroes who have borne a prominent part in this world's struggles, who have shed their life-blood in their country's cause, or have dared to raise their voice in behalf of a sovereign doomed to death by his people, have been handed down with honour to posterity; and well is it that names such as these should be immortalised. But in life's more hidden paths, how many a noble deed has been achieved, how many an act of self-sacrifice silently performed, which will never be known until that day when every hidden thing shall be made manifest! It is one of these unknown or long-forgotten heroes whom we are now about to introduce to our readers, in the hope that his brief but eventful history may not prove uninteresting.

Amongst the attendants of the hapless Queen Marie Antoinette, there was one named Valentin. In her service he began the career of self-devotion which he pursued through life. At the Tuileries, on the fatal 21st of June 1791, he fought in defence of his sovereign, and was carried, wounded, from the palace. Time passed on, and Valentin, recovered from his wounds, sought another service.

He offered himself to the Marquis of Caraccioli, formerly Neapolitan ambassador to the French court, but now a ruined man. The marquis at first declined his services, assuring him that his broken fortunes would not admit of his keeping a valet; but Valentin seemed to feel a singular attraction towards this Neapolitan nobleman, and well-nigh insisted on attaching himself to his fortunes. Evil days, however, were in store for the once wealthy and popular ambassador. Compelled by poverty to live in one of the most crowded streets of Paris, he fell into ill health, and during this time of sickness, was unable to procure the most ordinary comforts and even necessities of life.

The faithful Valentin, who in his earlier years had been a turner by profession, caused the marquis to be removed to an airy apartment belonging to a chair-maker in the Faubourg St Antoine. Here he not only paid the rent of the room by working for the

landlord, but also earned enough to maintain his suffering master.

Day by day, however, the illness of the marquis assumed a more serious character; increased care and more abundant nourishment were required by the invalid. Poor Valentin, with a *mistaken*, perchance, yet generous pride, would not make known the destitute condition of the marquis to any amongst his former wealthy friends; but when his own earnings proved insufficient, he appealed to the government of the day for help; his application, however, proved fruitless, and Caraccioli died in penury and want.

When Valentin stood by his master's corpse, he felt as if he had never till then known how dear Caraccioli was to his heart. He could not endure the thought that this noble man, of illustrious name and ancient lineage, should be committed to a pauper's grave. He accordingly hastened to a notary, sold, for the sum of L.12, a small property which he had purchased with the savings of his earlier years, discharged the few debts contracted during the illness of Caraccioli, and with the remainder of this sum, paid for the unpretending funeral of the once honoured ambassador of Naples.

About this time, Madame Junot, Duchess of Abrantes, was setting up her establishment on her return from Lisbon, whither she had accompanied her husband on an embassy to the Portuguese court. A good old abbé who had become acquainted with Valentin, and knew the generous self-devotion he had manifested towards his late master, mentioned the circumstances of his past history to Madame d'Abrantes, and the very next day he was engaged in her service.

The heart of the faithful servant was quickly won by the sympathising interest with which his new mistress listened to his recital of the wrongs and misfortunes of the marquis, and his gratitude knew no bounds when she erected a monument over his master's tomb.

In this happy servitude, time passed quickly with Valentin, until, in the year 1804, he inherited a small property in his native province. He was then about fifty-five years of age, and Madame Junot, on learning his unexpected good-fortune, congratulated him on being now in a position to retire from service, and settle in a house of his own, with a modest competence.

'Do you, then, intend to dismiss me from your service, madame?' exclaimed Valentin in a sorrowful tone.

'Dismiss you! My poor Valentin, why, what on earth could put such an idea into your head?' exclaimed Madame Junot.

'I thought my lady spoke of my going away.'

'I only congratulated you on the prospect of being henceforth your own master,' rejoined the duchess; 'but if you are not disposed to enjoy your liberty, that is no business of mine, and certainly, if you wait for me to dismiss you, you will remain with me for ever.'

Not long after this conversation, Junot, having incurred the emperor's displeasure, was superseded as governor of Paris, and sent to command at Arras. This change of position of course involved some alteration in domestic arrangements, and many attendants were dismissed from the service of the duke. To Valentin, however, was deputed the confidential post of superintending the establishment which Madame d'Abrantes still maintained in Paris. He was chosen for this post as being one in whose integrity the most absolute trust might be reposed. Madame d'Abrantes was therefore much surprised, on the eve of her departure for Arras, to see Valentin enter the apartment with an air of deep agitation. His countenance was pale as death, and when he attempted to speak, his voice faltered, and it seemed as though he could not utter a word. Unable to conceive the cause of his distress, Madame d'Abrantes said, in a soothing tone: 'I hope, Valentin, you are not vexed at being left

behind here in Paris: you know it cannot be helped; the duke and I chose you for this post on account of the unbounded confidence we place in your integrity.'

'O no, madame, it is not that,' faltered forth the poor man; 'I know that it is right I should stay; indeed, I should have asked leave to stay, even if your grace had not commanded me to do so. It is not that; it is—that people say my lord and lady are in disgrace with the First Consul, just as my poor old master was in disgrace with the Neapolitan court—and my lord and lady are going to take the children with them: it will be an expensive journey; and just at this moment the general has had such heavy expenses, this must take him by surprise. In short, madame, forgive me, but I have been to M. Tricard, the notary, and I asked him for my money, without telling him my reason for wanting it; and here it is. If my lord and lady will only be so good as to use it just as though it were their own.'

'Never,' exclaims Madame Junot in her memoirs—'never can I forget this moment: it is graven upon my heart rather than upon my memory, and time can never efface it. Had I needed the money, the recollection that Valentin was my own servant, would not have caused me to hesitate for a moment in accepting his generous offer. I felt that his noble conduct through life had raised him to an equality with myself—to the highest rank in the social scale.'

Junot himself had entered the apartment while this conversation was going on between the faithful Valentin and his mistress. He listened in silence to the generous offer of this noble-hearted man, who was not even aware of his presence. But when Valentin laid upon the table the four bags, containing his 3700 francs—his little earthly all—the kind-hearted general could no longer contain himself, but stepping forward, clasped the worthy valet to his heart, as though he had been his own brother. To Valentin's great sorrow, however, M. and Madame d'Abrantes declined the proffered sum, of which, in fact, they did not in the slightest degree stand in need. He seemed, however, so deeply pained by their refusal of his offer, that at last Junot exclaimed: 'Well, Valentin, I will take your money, but only on one condition—my man of business shall pay you 10 per cent. for it so long as you live.'

This condition was faithfully fulfilled; but, upon the death of the duke, Valentin, knowing his master's property to be cumbered with debts, insisted upon not receiving more than 5 per cent. interest for his money. Madame d'Abrantes knew him too well to grieve his faithful heart by pressing the matter any further in this her own hour of distress; but, on the return of the Bourbons, she told his history to the Duchess of Angoulême, who bestowed upon him a pension of L.50 a year, in consideration of the service he had rendered to the Queen Marie Antoinette in 1791.

About this time, Valentin's health becoming enfeebled, he retired from the service of Madame d'Abrantes, and settled at Belleville. Here he lived to a good old age, beloved and respected by all who knew him, and having nobly earned, in the course of his eventful life, the honourable title of a 'good and faithful servant.'

A BLESSED PROVIDENCE FOR OUR CONTINENTAL NEIGHBOURS.

A FOREIGN gentleman remarked to the Rev. Dr Guthrie of Edinburgh: 'What a blessed Providence! you Anglo-Saxons are a drunken race!' He explained his meaning to be, that such was the outrivalling energy and industry of the Anglo-Saxon people, in England, America, every where, that but for this happy drawback, no foreigners had a chance in competition with them. The reverend gentleman declares

that he felt the remark to be *very snell*. It might be a jest; but there is many a true word so spoken, and we fear this is of the number. Perhaps no man has had more opportunities of studying the condition of the lower class of people in our large cities than this same Dr Guthrie; and he declares that, in all his efforts amongst them in Edinburgh, he has met the vice of drunkenness at every step as a difficulty in the way of every reformation: it destroys more men and women, 'body and soul, breaks more hearts, ruins more families, than all other vices put together. In his visitations, nothing struck him more than to find more than half of the families in the church-yard. Numberless children, he says, are carried off, wholly in consequence of the drunken habits of their parents.

The tee-totalers almost seem to prove too much. They are fond of adducing Mr Porter's calculation, that fifty millions are spent annually on drink in the United Kingdom. One is at a loss to understand whence the money comes. Yet some of the separate facts are startling enough. In Musselburgh, a town near Edinburgh, containing 7000 inhabitants, fishermen, net-makers, &c., the number of public-houses and spirit-shops is 57, being one for every 120 people, or we may assume, for every 25 adult males. In Dundee, a town of 80,000 people, the spirit-shops and taverns are 364—a more moderate, but still large proportion. In Edinburgh, wherever the poorer class of people dwell, places for the sale of liquor abound. In the central street of the Old Town, less than a mile long, there are 97; and in each of twenty-one of these, the amount of whisky dispensed, chiefly among the very poor, in a quarter of a year, was found to be 400 gallons. Wherever a poor street is interjected in the better districts of the city, it is found to be thickly planted with spirit-shops, most of which, in their handsome, goodly style of furnishing, speak strongly of what they do in the way of draining the pockets of the humbler classes. The writer had the curiosity, one day, to count those in a short street near his own residence, and found them nine in number, being a greater number than all the other shops put together. In a section of another street, about 150 yards in length, he found five. We are also informed of a district of the town, containing 500 families, where the number of licensed spirit-shops is 19. What a strange spectacle it forms in a land assumedly civilised, rational, and Christian—so much permitted temptation in the way of the poor, all looking so gay and so goodly, sanctioned by law, beyond even remonstrance from philanthropy, and yet manifestly leading multitudes to destruction, and forming a frightful counterpoise to every influence for good that the spirit of modern civilisation can supply! It may be foolish to suppose, as some do, that a direct extinction of the evil is practicable; but when we think of what the evil is, what appalling calamities in the forms of poverty, crime, and infectious disease it produces, we rather wonder that the political system of our country can bear its further existence for a day, than that a few enthusiasts have dreamed of its forcible suppression.

Our southern neighbours have strongly proclaimed their disinclination to have any shortening of the hours of public-houses, on Sundays or otherwise. In Scotland, an act imposing certain restrictions of this nature has been submitted to with comparative resignation. In Scotland, however, we must remember, the evil is of a direr kind, in consequence of the more demoralising character of the favourite drink. There was here a greater call upon the middle classes to endure certain inconveniences for the sake of their humbler brethren. It is a kind of measure which no lover of individual liberty can approve of; yet it has in this instance done some good, as far as the diminution of cases of people taken up as drunk and disorderly is concerned. Of that diminution, indeed,

doubts have been expressed, but, we believe, without just foundation. It is the one comforting circumstance in a wide-spread scene of degradation and woe.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXIII.—TRANSLATING THE 'SIGN.'

THIS discovery brought us to a halt. A consultation ensued, in which all took part; but as usual, the others listened to the opinions of the prairie-men, and especially to that of Rube.

The old trapper was inclined to sulk for some time, and acted as if he meant to withhold his advice. Nothing 'nuffed' him more than to have his word contradicted or his skill called in question. I have known him to be 'out of sorts' for days, from having his woodcraft doubted by some one whom he deemed less skilled than himself; and, indeed, there were few of his kind whose knowledge of the wilderness was at all comparable with his. He was not always in the right, but generally where his instincts failed, it was idle to try further. In the present case, the man who had thoughtlessly doubted him was one of the 'greenest' of the party, but this only aggravated the matter in the eyes of Old Rube.

'Sich a fellur as you,' he said, giving a last dig to the offending ranger—'sich a fellur as you oughter git yur head shet up: thet ur tongue o' yourn keeps a gwine like a bull's tail in fly-time. Waghl!'

As the man made no reply to this rather rough remonstrance, Rube's 'dander' soon smoothed down, and once more getting cool, he turned his attention to the business of the hour.

That there had been Indians upon the ground was now an ascertained fact; the peculiar shoeing of the horses rendered it indubitable. Mexican horses, if shod at all, would have had a shoeing of iron—at least on their fore-feet. Wild mustangs would have had the hoof naked; while the tracks of Texan or American horses could have been easily told, either from the peculiar shoeing or the superior size of their hoofs. The horses that had galloped over that ground were neither wild, Texan, nor Mexican: Indian they must have been.

Although the one track first examined might have settled the point, it was a fact of too much importance to be left under the slightest doubt. The presence of Indians meant the presence of enemies—foes dire and deadly; and it was with something more than feelings of mere curiosity that my companions scrutinised the sign.

The ashes were blown out from several others, and these carefully studied. Additional facts were brought to light by those Champollions of the prairie—Rube and Garey. Whoever rode the horses, had been going in a gallop. They had not ridden long in one course; but here and there had turned and struck off in new directions. There had been a score or so of them. No two had been galloping together; their tracks converged or crossed one another—now zigzagging, now running in right lines, or sweeping in curves and circles over the plain.

All this knowledge the trackers had obtained in less than ten minutes, simply by riding round the place. Not to disturb them in their diagnosis, the rest of us halted upon the spot where the new tracks had been first observed, and there awaited the result of their scrutiny.

In ten minutes' time both came back to us; they had read the sign to their satisfaction, and needed no further light.

That sign had disclosed to them one fact of more significance than all the rest. Of course, we all knew that the Indian horsemen had gone over the ground

before the grass had been burnt; but how long before? We had no difficulty in making out that it was upon that same day, and since the rising of the sun—these were trifles easily ascertained; but at *what* hour had they passed? Late, or early? With the steed, before, or after him?

About this point I was most anxious, but I had not the slightest idea that it could be decided by the 'sign.' To my astonishment, those cunning hunters returned to tell me, not only the very hour at which the steed had passed the spot, but also that the Indian horsemen had been riding *after him!* Clairvoyance could scarcely have gone farther.

The old trapper had grown expletive, more than was his wont. It was no longer a matter of tracking the white steed. Indians were near. Caution had become necessary, and neither the company nor counsel of the humblest was to be scorned. We might soon stand in need of the strength, even of the weakest in our party.

Freely, then, the trackers communicated their discoveries, in answer to my interrogation.

'The white hoss,' said Rube, 'must 'a been hyur 'bout four hour ago, kalkerlatin the rate at which he wur a gwine, an kalkerlatin how fur he hed ter kum. He haint 'a stoppet nowhur; an 'ceptin i' the thicket, he hez gallipt the rest o' the way—thet's clur. Wal, we knows the distance, thurfor we knows the time—thet's clur too; an four hour's 'bout the mark, I reck'n—preehaps a leetle less, an alser preehaps a leetle more. Now, furrermore to the point. Them niggurs hez been eyther clost arter 'im, in view o' the critter, or follerin 'im on the trail—the one or the t'other—an which 'tain't passible to tell wi' this hyur sign no-how-cum-somever. But thet they wur arter 'im, me an Bill's made out clur as mud—thet we sartintly hez.'

'How have you ascertained that they were after?'

'The tracks, young fellur—the tracks.'

'But how by them?'

'Easy as eatin hump-rib: them as wur made by the white hoss ur *un'ermost*.'

The conclusion was clear indeed. The Indians must have been *after him*.

We stayed no longer upon the spot, but once more sending the trackers forward, moved on after them.

We had advanced about half a mile farther, when the horse-tracks, hitherto scattered, and tending in different directions, became merged together, as though the Indians had been riding, not in single file—as is their ordinary method—but in an irregular body of several abreast.

The trackers, after proceeding along this new trail for a hundred yards or so, deliberately drew up; and dismounting, bent down upon their hands and knees, as if once more to examine the sign. The rest of us halted a little behind, and watched their proceedings without offering to question them.

Both were observed to be busy blowing aside the ashes, not from any particular track, but from the full breadth of the trail.

In a few minutes, they succeeded in removing the black dust from a stretch of several yards—so that the numerous hoof-prints could be distinctly traced, side by side, or overlapping and half obliterating one another.

Rube now returned to where they had commenced; and then once more leisurely advancing upon his knees, with eyes close to the surface, appeared to scrutinise the print of every hoof separately.

Before he had reached the spot where Garey was still engaged in clearing off the dust, he rose to his feet with an air that told he was satisfied, and turning to his companion, cried out:

'Don't bother furrer, Bill: it ur jest as I thort; they've roped 'im, by G—I!'

CHAPTER LXXIV.

THE STEED LAZOE.

It was not the emphatic tone in which this announcement was made that produced within me conviction of its truth; I should have been convinced without that. I was better than half prepared for the intelligence thus rudely conveyed; for I was myself not altogether unskilled in that art of which my trapper-companions were masters.

I had observed the sudden convergence of the horse-tracks; I had noticed also, that, after coming together, the animals had proceeded at a slow pace—at a walk. I needed only to perceive the hoof of the steed among the others, to know that he no longer ran free—that he was a captive.

This the tracker had found; hence the decisive declaration that the Indians had 'roped' him—in other words, had caught him with their lazoes.

'Sartint they've tuk 'im,' asserted Rube, in answer to an interrogatory: 'sartint sure; 'hyur's his track clear as daylight. He's been led hyur at the eend o' a laryette; he's been nigh the middle o' the crowd—some in front—some hev been arter 'im—thet's how they've gone past hyur. Wagh!' continued the speaker, once more turning his eyes upon the trail, 'thur's been a good grist on 'em—twenty or more; an ef this child don't miskalkulate, thet ain't the hul o' the niggurs; it ain't! 'Tur only some o' 'em as galliped out to rope the boss. I'd lay my rifle agin a Mexican blunderbox, thur's a bigger party than this nigh at hand somewher hyur. By Geeshosphat, thet's boun to be, sartint as sunup!'

The suspicion that had half formed itself in my mind was no longer hypothetical; the sign upon the trail had settled that: it was now a positive intelligence—a conviction. The steed had been taken; he and his rider were captive in the hands of the Indians.

This knowledge brought with it a crowd of new thoughts, in which emotions of the most opposite character were mingled together.

The first was a sensation of joy. The steed had been captured, and by human beings. Indians at least were men, and possessed human hearts. Though in the rider they might recognise the lineaments of their pale-faced foes—not so strongly neither—yet a woman, and in such a dilemma; what reason could they have for hostility to her? None; perhaps the very opposite passion might be excited by the spectacle of her helpless situation. They would see before them the victim of some cruel revenge—the act, too, of their own enemies; this would be more likely to inspire them with sympathy and pity; they would relieve her from her perilous position; would minister to her wants and wounds; would tenderly nurse and cherish her: yes; of all this I felt assured. They were human; how could they do otherwise?

Such was the first rush of my reflections on becoming assured that the steed had been captured by Indians—that Isolina was in their hands. I only thought of her safety—that she was rescued from pain and peril, perhaps from death; and the thought was a gleam of joy.

Alas! only a gleam; and the reflections that followed were painfully bitter.

I could not help thinking of the character of the savages into whose hands she had fallen. If they were the same band that had harried the frontier town, then were they southern Indians—Comanche or Lipan. The report said one or other; and it was but too probable. True, the remnant of Shawanoes and Delawares, with the Kickapoos and Texan Cherokees, sometimes stray as far as the banks of the Rio Grande; but the conduct was not theirs: these tribes, from long intercourse with whites, have been inducted into a sort of semi-

civilisation; and their hereditary hostility for the pale-face has died out. Pillage and murder are no longer their trade; it could not have been they who had made the late foray. It might have been 'Wild Cat' with his wicked Seminoles, now settled on the Texan frontier; but the act was more in keeping with the character of the mezcal-eating Apaches, who of late years had been pushing their expeditions far down the river. Even so—it mattered little; Apaches are but Comanches, or rather Comanches, Apaches, and whether the Indians on whose trail we were standing were one or the other—whether Apache, Lipan, Comanche, or their allies Caygüa, Waco, or Pawnee-Pict, it mattered not; one and all were alike; one or other of them, my reflections were bitterly the same. Well understood I the character of these red men of the south; so far differing from their kindred of the north—so far different from that ideal type of cold continence it has pleased the poet and the writer of romance to ascribe to them. The reverse of the medal was before my mind's eye; the memory of many a scene was in my thoughts, of many a tale I had heard, illustrating the uxorious disposition, the wild, unbridled wantonness of these lords of the southern plains.

Not then did I dwell long on such thoughts; for they had their influence in urging me onward.

But there was another reason for our rapid advance: all of us were under the extreme agony of thirst—literally gasping for water; and thus physical suffering impelled us to ride forward as fast as our jaded horses could carry us over the ground.

Timber was at length before our eyes, green foliage, looking all the fresher and brighter from contrast with the black plain which it bounded. It was a grove of cotton-woods, skirting a prairie-stream; and beyond this the fire had not extended.

Wild joyous cries escaped from men and horses, as their eyes rested upon the limpid stream. The men leaped out of their saddles, and without a thought of drowning, rushed breast-deep into the water. Some lifted the crystal liquid in their palms; others, more impatient, bent down, and plunging their faces in the flood, drank *à la mode du cheval*.

I noticed that the trappers behaved less recklessly than the rest; before going down to drink, the eyes of both were directed, with instinctive caution, along the banks, and into the timber.

Close to where we had halted, I observed a crossing, where numerous tracks of animals formed in the soil a deep, well-beaten path. Rube's eyes were upon it, and I saw that they were glistening with unusual excitement.

'Told 'ee so!' cried he, after a short survey: 'yander's thur trail—war-trail, by the Eternal!'

CHAPTER LXXV.

THE 'INDIOS BRAVOS.'

You may be asking, what the trapper meant by a war-trail? It has been a phrase of frequent occurrence with us. It is a phrase of the frontier. Even at the eleventh hour, let me offer its explanation.

For half a century—ay, for three centuries and more—even since the conquest itself—the northern frontier of Mexico has been in, what is termed in old-fashioned phraseology, a 'disturbed state.' Though the semi-civilised Aztecs, and the kindred races of town-dwelling Indians, easily yielded to the sword of the Spanish conquerors, far different has been the history of the wild tribes—the free hunters of the plains. Upon those mighty steppes that occupy the whole central area of the North American continent, dwell tribes of Indians—nations they might be called—who neither know, nor ever have known, other rule

that of their own chieftains. Even when Spain at her strongest, she failed to subjugate the 'Indios bravos' of her frontiers, who to the present hour have preserved their wild freedom. I speak not of the great nations of the northern prairies—Sioux and Cheyenne—Blackfeet and Crow—Pawnee and Arapahoe. With these the Spanish race scarcely came in contact. I refer more particularly to the tribes whose range impinges upon the frontiers of Mexico—Comanche, Lipan, Utah, Apache, and Navajo.

It is not in the annals of Spain to prove that any one of these tribes ever yielded to her conquering sword; and equally a failure has been the attempt to wheedle them into a fanatical civilisation by the much-boasted request of the mission. Free, then, the prairie Indians are from white man's rule, and free have they been, as if the keels of Columbus had never ploughed the Caribbean Sea.

But although they have preserved their independence for three centuries, for three centuries have they never known peace. Between the red Indian and the white Iberian, along the frontier of Northern Mexico, a war-border has existed since the days of Cortez to the present hour—constantly shifting north or south, but never extended from east to west, from ocean to ocean, through wide degrees of longitude. North of this border ranges the 'Indio bravo'; south of it dwells his degenerate and conquered kinsman, the 'Indio manso,' not in the 'tents,' but in the towns of his Spanish conqueror; the former, free as the prairie wind—the latter, yoked to a condition of 'peon' vassalage, with chains as strong as those of slavery itself. The neutral belt of hostile ground lies between—on the one side guarded by a line of garrisoned forts (*presidios*); on the other, sheltered from attack by the wild and waterless desert.

I have stated that this war-border has been constantly shifting either northward or southward. Such is its history up to the beginning of the present cycle. Since then, a remarkable change has been going forward in the relative position of Indian and Iberian; and the line of hostile ground has been moving only in one direction—continually *towards the south*! To speak in less poetical phrase, the red man has been encroaching upon the territory of the white man—the so-called savage has been gaining ground upon the domain of civilisation. Not slowly or gradually either, but by gigantic strides—by the conquest of whole provinces as large as England ten times told!

I shall make the announcement of a fact, or rather a hypothesis—scarcely well known, though strange enough. It may interest, if not surprise, the ethnologist. I assert then, that had the four tribes of Northern Mexican Indians—Comanche, Lipan, Apache, and Navajo—been left to themselves, in less than another century they would have driven the degenerate descendants of the conquerors of Cortez from the soil of *latavac*. I make this assertion with a full belief and clear conviction of its truthfulness. The hypothesis rests upon a basis of realities. It would require but very simple logic to prove it; but a few facts may add illustration.

With the fall of Spanish rule in Mexico, ended the predominance of the Spaniard over the Indian. By weakness, the *presidios* became shorn of their strength, and no longer offered a barrier even to the weakest incursion. In fact, a neutral line no more exists; whole provinces—Sonora, Chihuahua, Tamaulipas, Coahuila, and Leon—are no better than neutral ground, or, to speak more definitely, form an extended territory conquered and desolated by the Indians. Even beyond these, into the 'provincias internas,' have he bold copper-coloured freebooters of late carried their forays—even to the very gates of Durango. Two hundred Comanche warriors, or as many Apaches, fear not to tide hundreds of miles into the heart of civilised

Mexico—hesitate not to attack a city or a settlement—scruple not to drag from hearth and home lovely maids and tender children—only these—and carry them slave and captive to their wild fastnesses in the desert! And this is no occasional foray, no long gathering outburst of revenge or retaliation; but an *annual* expedition, forming part of the regular routine of the year, and occurring at the season when the buffalo have migrated to the north—occurring in that month in the calendar of these aboriginal brigands jocosely styled the 'Mexican moon!'

Upon whose head falls the blow thus periodically repeated? Upon the poor and unprotected? No doubt you will fancy so.

A single fact may serve to undeceive you. Only a few years ago, Trias, a man of 'first family' in Mexico, and governor of the state of Chihuahua, lost one of his sons by an Indian foray. The boy was taken prisoner by the Comanches; and it was only after years of negotiation and payment of a large sum, that the father recovered his child. Thus the governor of a province, with means and military at his command, was not powerful enough to cause the surrender of his captive son: he was forced to *buy* him!

It is computed that at this moment there are 3000 white captives in the hands of the North Mexican Indians—nearly all of them of Spanish descent. They are mostly females, and live as the slave-wives of their captors—if such connection may be dignified by the name. There are white men, too, among the Indians—prisoners taken in their youth; and strange as it may appear, few of them—either of the men or women—evidence any desire to return to their former life or homes. Some, when ransomed, have refused the boon. Not uncommon along the frontier has been witnessed that heart-rending scene—a father who had recovered his child from the savages, and yet unable to reclaim its affection, or even to arouse it to a recognition of its parentage. In a few years—sometimes only months—the captives forget their early ties, and become wedded to their new life—become *Indianized*.

But a short time before, an instance had come under our own observation. The wounded brave taken in the skirmish at the mound was a full-blooded Mexican—had been carried off by the Comanches, some years before, from the settlements on the Lower Rio Grande. In consideration of this, we gave him his liberty, under the impression that he would gladly avail himself of the opportunity to return to his kindred.

He proved wanting in gratitude as in natural affection. The same night on which he was set free, he took the route back to the prairies, mounted upon one of the best horses of our troop, which he had stolen from its unfortunate owner!

Such are the 'Cosas de Mexico'—a few of the traits of frontier-life on the Rio Bravo del Norte.

But what of the war-trail? That is not yet explained.

Know, then, that from the country of the Indians to that of the Mexicans extend many great paths, running for hundreds of miles from point to point. They follow the courses of streams, or cross vast desert plains, where water is found only at long intervals of distance. They are marked by the tracks of mules, horses, and captives. Here and there, they are whitened by bones—the bones of men, of women, of animals, that have perished by the way. Strange paths are these! What are they, and who has made them? Who travel by these roads that lead through the wild and homeless desert?

Indians—they are the paths of the Comanche and Cnygüa—the roads made by their warriors during the 'Mexican moon.'

It was upon one of these that the trapper was gazing when he gave out the emphatic utterance:

'War-trail, by the Eternal!'

CHAPTER LXXVI.

ON THE WAR-TRAIL.

Scarcely staying to quench my thirst, I led my horse across the stream, and commenced scrutinising the trail upon the opposite bank. The faithful trackers were by my side—no fear of them lagging behind.

I had won the hearts of both these men; and that they would have risked life to serve me, I could no longer doubt, since over and over again they *had* risked it. For Garey, strong, courageous, handsome in the true sense, and noble-hearted, I felt real friendship, which the young trapper reciprocated. For his older comrade, the feeling I had was like himself—indefinable, indescribable. It was strongly tinged with admiration, but admiration of the intellectual rather than the moral or personal qualities of the man.

Instead of intellectual, I should rather say instinctive, for his keen intuitive thoughts appeared more like instincts than the results of a process of ratiocination.

That the old trapper admired me—in his own phraseology, 'liked me mightily'—I was aware. He was equally zealous as the younger in my service; but too free an exhibition of zeal was in his eyes a weakness, and he endeavoured to conceal it. His admiration of myself was perhaps owing to the fact that I neither attempted to thwart him in his humours nor rival him in his peculiar knowledge—the craft of the prairie. In this I was but his pupil, and behaved as such, generally deferring to his judgment.

Another impulse acted upon the trackers—sheer love of the part they were now playing. Just as the hound loves the trail, so did they; and hunger, thirst, weariness, one or all must be felt to an extreme degree before they would voluntarily forsake it.

Scarcely staying, therefore, to quench their thirst, they followed me out of the water; and all three of us together bent our attention to the sign.

It was a *war-trail*—a true war-trail. There was not the track of a dog—not the drag of a lodge-pole upon it. Had it been a moving encampment of peaceable Indians, these signs would have been visible; moreover, there would have been seen numerous footsteps of Indian women—of squaws; for the slave-wife of the lordly Comanche is compelled to traverse the prairies *à pied*, loaded like the packhorse that follows at her heels!

But though no foot-prints of Indian women appeared, there were tracks of women, scores of them, plainly imprinted in the soil of the river-bank. Those slender impressions, scarcely a span in length, smoothly moulded in the mud, were not to be mistaken for the footsteps of an Indian squaw. There was not the wide divergence at the heels—the toes turned inward; neither was there the moccasin-print. No; those tiny tracks must have been made by women of that nation who possess the smallest and prettiest feet in the world—by women of Mexico.

'Captives!' we exclaimed, as soon as our eyes rested upon the tracks.

'Ay, poor critters!' said Rube sympathisingly; 'the cussed niggers hev made 'em fut it, while thur's been spare hosses a plenty. Wagh! a good wheen o' weemen thur's been—a score on 'em at the least. Wagh! I pity 'em, poor gurls! in sech kumpany as they've got into. It ur a life they've got to lead. Wagh!'

Rube did not reflect how heavily his words were falling upon my heart.

There were the tracks of more than a hundred horses, and as many mules. Some of both were iron-shod; but for all that, we knew they had been either ridden or driven by Indians: they, too, were captives.

The sign helped my companions to much knowledge that would have been unintelligible to me. It was

certainly the path of a war-party of Indians on the *back track*. They were laden with plunder, and driving before them, or forcing to follow, a crowd of captives—horses, mules, and women—children, too, for we saw the tiny foot-marks of tender age. The trail was significant of all this—even to me.

But my comrades saw more; they no longer doubted that the Indians were Comanches—a moccasin had been picked up, a castaway—and the leathern tassel attached to the heel declared the tribe to which its wearer belonged to be the Comanche.

The trail was quite fresh; that is, but a few hours had intervened since the Indians passed along it. Notwithstanding the dryness of the atmosphere, the mud on the river-edge had not yet become 'skinned,' as the trappers expressed it. The Indians had forded the stream about the time the prairie was set on fire.

The horses we had been following across the burnt plain were those of a party who had gone out in pursuit of the steed. Just at the ford, they had overtaken the main body, who carried along the spoil and captives. From that point, all had advanced together.

Had they done so? This was our first object of inquiry. It was almost too probable to admit of a doubt; but we desired to be certain about a matter of such primary importance, and we looked for the hoof with the piece chipped from its edge—easily to be identified by all of us. In the muddy margin of the stream we could not find it; but the steed may have been led or ridden in front of the rest, and his tracks trampled out by the thick drove that followed.

At this moment, Stanfield came up and joined us in the examination. The ranger had scarcely bent his eyes on the trail, when a significant exclamation escaped him. He stood pointing downward to the track of a shod horse.

'My horse!' cried he; 'my horse Hickory, by Gosh!'

'Your horse?'

'May I never see Kaintuck if it ain't!'

'Yur sure o' it, ole hoss? yur sure it's yurn?'

'Sure as shootin'; I shod him myself. I kid tell that ere track on a dry sand-bar. I know every nail thar; I druv 'em wi' my own hand—it's him sartin'.

'Wheeo-o!' whistled Rube in his significant way, 'thet makes things a leetle plainer, I reck'n; an so I thort all along—an so I thort—ye-es—so I thort. The durned rennygade niggur!' he added with angry emphasis, 'I know'd we dud wrong to let 'im go; we oughter served 'im as I perposed; we oughter cut his durnation throat, an scalped 'im the minnut we tak 'im: cuss the luck thet we didn't! Wagh!'

Rube's words needed no interpretation. We knew whose throat he would have cut—that of the Indianised Mexican taken at the mesa; and I remembered that at the time of his capture such had been Rube's advice, overruled, of course, by the more merciful of his comrades. The trapper had assigned some reason; he knew something of the man's history.

He now repeated his reasons:

'He ur a true rennygade,' said he; 'an thur ain't on all the parairs a wusser enemy to whiten thar thet ur—more partiklurly to Texan whites. He wur at the massaree o' Wilson's family on the clur fork o' the Brazos, an wur conspik'us in the skrimmige a' more too—it ur thort he toated off one o' Wilson's gurls, an made a squaw o' her, for he's mighty giv'th that way I've heern. Wagh! he ur wuss than a Injun, for the reezan thet he unerstans the ways of the whites. I never know'd sich a foolish thing as to let 'im git clur. 'Ee may thank yur luck, Mister Stannafeel, thet he didn't take yur har at the same time when he wur atakin o' yur hoas. Wagh! thet ya may!'

It was Stanfield's horse that had been stolen by the renegade, and the tracks now identified by the

anger were those of that animal—no doubt with the booter upon his back.

This new discovery let in a flood of light. Beyond doubt, the war-party was the same we had met by the mound, with perhaps a reinforcement; the same that had just plundered the Mexican town; the same who had paid their hurried visit to the hacienda, and the renegade—

Ha! Strange remembrances were crowding into my brain. I remembered meeting this semi-savage talking about the road, after we had granted him a parole; I remembered, upon one occasion, seeing him while riding out with *her*; I remembered the rude expression with which he had regarded my companion the glance half-fierce half-lustful; I remembered that made me angry; that I rebuked and threatened him—I now remembered all.

Wild thoughts came rushing into my mind—worse thoughts than ever.

I sprang to my saddle, and, calling out some half-remembered orders, rode rapidly along the trail.

TRAWLING AND DREDGING.

SHALL we go or not? Oh, I *hope* the weather is all right! was my first thought, as I sprang from my bed on the day last summer, and hastened to the window to ascertain the state of the wind and the aspect of the heavens. I had formed an engagement for trawling and dredging, both new amusements to me, and both being promise of great enjoyment; but as I looked out on the moveless shrubs, and saw that a soft rain was descending, my heart sank within me; I knew that without wind we could not go; and not a breath of wind could I detect. However, being of a somewhat cheerful character, and knowing that a breeze *might* come, I 'took heart of grace,' donned my sea-clothes, and made ready. Presently, a rustling amongst the shrubs made me prick up my ears with joy, and, taking a glance around me, I soon descried most hopeful symptoms. The rain had ceased, and the sun had begun to struggle out, bringing with it what soon became a most undeniable breeze; and so, gathering up my gear, I set out with heart elate on my expedition.

For the benefit of those who may be as much in the dark on such subjects as I was myself some little time ago, I will describe the implements of our toil, and the mode of using them.

The *trawl*—a word I find in no dictionary, though Bailey, that prince of lexicographers, gives: 'to trowl, to move or wander about'—is a huge net, made of very strong twine, with meshes about an inch and a half in length. The edge of this net is run in a cord, so that it may be drawn up into a bag, and on one side of it is attached to a stout bar of wood about twenty feet long, with iron grapples at each end, by which it is hitched on to the side of the vessel. To this bar are fastened as many fathoms of stout rope, about an inch in diameter, as are sufficient to reach the bottom of the waters which the trawl is meant to search; and the bag is heavily leaded, so as to descend to the bottom. When the trawl is required to be used, two men unloose its fastenings, and drop it over the side of the vessel into the sea, uncoiling sufficient cable to follow to its depths. The boat then sails on, dragging the net through the waters for as long a time as it is thought necessary. For naturalists' purposes, this is not more than from ten to twenty minutes; but the professional trawlers, whose prize is fish, often keep it down five or six hours. When the net is drawn, the boat is turned so as to sail over the line of rope, on which two men pull lustily, while a third coils the cable as they free it, until the net appears just below the surface of the water. This is an exciting moment: and of it hereafter.

The *dredge* is a bag of very thick netting, so close in its meshes, that scarcely the smallest shell can go through them. This is strongly fastened to an oblong frame of iron about thirty inches long by fifteen or eighteen wide, more or less, the edges of which are sharpened so as to scratch the rocks, &c., at the bottom as it is dragged along. The dredge is attached to cords in the same manner as the trawl, and is thrown over and managed much in the same way; but, being a lighter instrument, only one man is required to work it. Sometimes the dredge brings up nothing but sand and mud; at others, plenty of animals of *sorts*; and now and then matters that have been dropped from some ship or boat are thus fished up—as, for instance, my friend told me he had the night before dredged up several fathoms of good new rope, exactly what he had been going to buy for use, and which was at the moment he spoke doing duty on the dredge.

An excellent concomitant to the dredge is a square box, with a bottom of fine fly-wire, into which another, with coarser wire-net for its bottom, fits. When your dredge comes up laden with sand and mud, or the contents are otherwise dirty, put them by instalments into this box, and make one of your sailors hold it overboard in the water until all the sand and mud is washed away. You will then find the larger articles clean and clear in the upper box, whilst the minute shells and other things will have sifted through, and be equally clean and nice in the lower box. This is a capital contrivance, and greatly facilitates the work.

These implements, together with plenty of wide-mouthed pickle-bottles, glass jars, tin cans, &c., for receiving and separating the contents of the trawl or dredge as you receive them, are all that are requisite for the double purpose of trawling and dredging.

My impatience had made me reach the rendezvous on the quay long before the rest of the party; but I was not weary of waiting, for the scene was more than pleasant. The sea was all sparkle and beauty, the sky of unbroken azure; the finely wooded grounds of Tor Abbey lay on my left. Opposite to me was the pretty Strand, as the row of shops facing the sea at Torquay is called, with all its bustle of carriages, and pretty stands of red, and blue, and yellow donkey-chairs and flies, far enough off not to disturb me with its bustle, but near enough to amuse me by its liveliness; and between me and it was the basin, now full of water, and covered with vessels of different kinds. Just below, at the foot of the steps, lay the beautiful little yacht, the *Ribble*, preparing to sail, with her smart crew all alive, and all her elegant equipments contrasting strongly with the heavy coal-schooner which was just easing herself off from her moorings, also preparing to sail the moment the way was clear.

It took but few minutes for the white sails of the *Ribble* to fill, and bear her out with a spring into the bay towards Paignton. Then a sharp tack, and she dashed past us, cutting her way back with a velocity that was almost inconceivable across the bay towards the *Noze*, and was gone!

Meanwhile, the heavy collier had spread her dark gray patched sails and begun to clear out. She moved off heavily, but sailing steadily with a grave dignity and grace quite unlike the active movements of the little yacht, yet very beautiful. She also took the course towards Paignton, then tacked, crossed our course, and again recrossed us—for by this time our party had assembled, and the little *Mystery* was on her way to the dredging-ground—and then disappeared behind Berry Head.

And now over went the trawl; and after arranging all our pots and pans, and dipping up a supply of fresh sea-water, so that everything might be ready against the net coming up, we beguiled the time by watching the shifting lights on the shore, the birds on the water, or

in the air above it, and the fleecy white clouds which just flecked the blue of the sky, and were mirrored in that of the sea—until notice was given to haul up.

'Look out for *Nudibranchs*,' said my companion, a scientific friend, who had kindly taken the guidance of our work; 'you will often find them sticking to the meshes of the net.' Now, it so happened that *Nudibranchs*—the naked-gilled mollusks which have their breathing-apparatus outside in the likeness of plumes of feathers—happened to be at present the objects of special interest to me, so that this announcement set me more on the alert than the cry of 'Whales ahead!' would a whaler: and not in vain. We picked off more than a dozen specimens of that beautiful little animal, *Polycera quadrilineata*, which, as they were handed to me, looked like little lumps of yellow jelly as big as a pea; but as I dropped them at once into a glass jar of clear water, their true form and colouring were displayed. This *Polycera*—I beg pardon for hard words, but it has no common name—is a little slug-like animal; that is, its foot is formed like that of slugs, and on it it creeps; but this foot is pure white, narrow, and long, tapering to a point behind. The body, of which the foot forms the lower part, rises in the middle, and sends out from an aperture in the back seven or nine pinnate, tapering plumes, 'richly dight with gold and white.' On each side of this bunch of feathers—which are, in fact, the gills or branchial tubes of the animal—is a single stout-pointed lobe, of white, tipped with chrome-yellow. The back is spotted and striped with the same rich colouring, and sometimes with black also. It has a pair of laminated tentacles, of bright yellow, rising from the top of the head, and bending backwards; and the frontal veil is extended into four elongated, pointed filaments of the same golden hue, which are ever in motion, and seem as if they acted as feelers. These pretty creatures swim on the surface of the water, foot upwards, or creep gracefully on the coral weeds in your tank, looking most elegant. But I am forestalling. As the trawl rose to view below the water, and before we could get it up, we were amused by the splash and dash of dozens of small flat fish, dabs and flounders, and amongst them that ugly fellow John Dory—of whom tradition hints that he was once the affianced of *Axa Chovy*, whose delicate flesh—albeit a mere flake of it exists on each side his body—used to tempt the old fish-epicure Quin to visit the coast every year for the purpose of eating John in his perfection. These were the prey of the boys of our party, who were very busy gathering them up. Then there were plenty of the violet cross-fish (*Uraster violacea*) and of the common cross-fish (*U. rubens*), and of other things more than there is time to record; and then over went the trawl again, and we tacked, and sailed back across the bay towards our dredging-ground off Anstey's Cove, dragging the trawl after us.

Whether it was the extreme speed with which we ran along, that kept the apparatus from reaching the bottom, I do not know; but it is probable it was so. Whatever might be the cause, the result was certain, for when we again hauled, we found not a thing worth having in our trawl. But we were now amongst the beautiful island-rocks which adorn the entrance of Torbay, and between them and the shore beyond Hope's Nose, lay our ground. This we prepared to search by fastening the trawl alongside, and throwing out the dredge.

'Does it jump?' asked the director of the sports of the man who held the rope. Now, jumping is the sign of being on good rocky ground, so we were glad to hear the answer: 'Capital, sir—goes along capital—can't be better;' and in five minutes or so, up came the bag with heaps of goods in it—goods enough to engage our attention for hours, if we had been free to give it. There were long tubes, six or eight inches in length, and about one-sixth of an inch in diameter, some straight

as an arrow, others curled and twisted—the homes of that beautiful crested worm the *Serpula vermicularis*. In some of them the animals lay *perdu*, only waiting to be left a little while quietly in a glass of clean water, to expand their scarlet funnel-shaped tubes of branchia round the mouth of their cells.* Others were empty—the forsaken homes of the dead. There were some coiled on stones, and only partially rising free; and there was another species of a smaller kind, with pure white tubular canes, multitudes of them twisted, and wreathed, and knotted together like Gordian-knots of small cords, in strange contortions, heads and tails all mixed together. These are very properly named *Serpula contortuplicata*. A number of pretty little semi-transparent prawns and shrimps of different kinds were in this haul, some tinged with red, some with green, and all with delicate fan-shaped tails expanded, and beautiful shining eyes on stalks. The stones and shells to which these *Serpulae* adhered were richly clothed with forests of elegant coral-weeds, which I cannot better describe than by quoting Kingsley's account of the garb of Maia Squinado, Esq. It is a spider-crab, of which he says:

'His whole back is covered with a little gray forest of branching hairs as fine as the spider's web, each branchlet carrying its little pearly ringed club, each club its rose-crowned polype, like—to quote Mr Gosse's comparison—the unexpanded buds of the acacia. On that leg grows, amidst another copse of the gray polypee, a delicate straw-coloured sertularia branch on branch of tiny double combs, each tooth of the comb being a tube containing a living flower; on another leg another sertularia, coarser, but still beautiful; and round it again has trained itself, plant upon plant of glass ivy, bearing crystal bells, each of which, too, protrudes its living flower; on another leg is a feathery species, like a little heather-bell of whitest ivory, and every needle-leaf a polype-cell. Let us stop before the imagination grows dizzy with the contemplation of those myriads of beautiful atomies. And what is their use? Each living flower, each polype mouth is feeding fast, sweeping into itself, by the perpetual currents caused by the delicate fringes upon its rays—so minute these last, that their motion only betrays their presence—each tiniest atom of decaying matter in the surrounding water, to convert it, by some wondrous alchemy, into fresh cells and buds, and either build up a fresh branch in their thousand-tenanted tree, or form an egg-cell, from whence, when ripe, may issue, not a fixed zoophyte, but a free swimming animal.' Such fairy gardens as above described covered almost everything we drew from the waves. There were crabs decked with plumes of sertularia, shells living and dead coated with shrubberies of pure white laomedææ of various kinds, all with each cell full of life, which as I dropped the shells one by one into pure clear water, and set the vessel where the sunbeams played on it, sent out their crystal stars of different forms in myriads—a glittering galaxy. Between these shrubs, the ground was incrustated with little mounds, and smooth-spread lawns, of a sort of cellular crust, from which issued elegant little bell-shaped flowers, some red, some white, some yellow, but always the same hue as the crust, composed of twenty or more shining filaments, each separate, but all rising together equal in length, and curving exactly to the same line of grace, so that the whole when expanded formed vase-shaped flowers, which stood as thick as blades of grass on the ground. There were different sorts of lepralia. In some cases, great masses of this stony coating were grouped round a stem of sea-weed in lumps as thick as the finger, and the living bells stood out on all sides like the florets on a spike of veronica.

* See Chambers's Journal, No. 73, p. 18.

But whilst I had been busy with my fairy shrubberies, the dredge had been at work amidst the rocks beneath us, and now up it came. Hey! what have we here? Writhing, twisting, tossing, up comes a mass of supple worm-like arms, all wreathed together in what appears to be inextricable confusion, and all combining a thousand different tints. But the confusion is not inextricable. Let them alone, and give them space, and one after another out walks hundreds of what Gosse's sailor calls 'them 'ere Ophiocomas.' We have taken *hundreds* of brittle stars (*Ophiocoma rosula*), no two alike, and each and all glowing with such hues as would equal the ribbon-beds of flowers at Sydenham. Each long-legged fellow boasts at least three colours, and most combine several more. There is the richest purple, striped with rose; yellow, mottled with scarlet, purple, and black ornaments; rich crimson picked out with white, and touched up with blue; deep blue, touched up with white and scarlet; scarlet, dashed with purple and orange. No butterflies' wings, no gaudy birds of eastern skies, ever could present you with more exquisitely brilliant combinations of hues, or with more delicate pencilling in their intermixture.

And now I take some of the finest, and drop them into my can; and gathering up the rest, we restore them to their own native world of waters, highly amused to watch their starry forms as they sink; and whilst the dredge goes down to seek for other prey, I will describe the wondrous structure of this gorgeous creature, as my lens displays it to me. In the centre is a somewhat pentagonal disk, with a circle of colour in the middle, from which branch five wide and five narrow rays, dividing it into ten parts; these, as also the central circles, are close set with spines. The spaces between are usually white, and the skin which covers them hangs loose, and alternately rises and falls with a most graceful swell, apparently from the breathing of the animal. From this disk spring five long spinous arms, each about five times as long as the diameter of the disk. These arms or rays have a line of rich colour running up them, perhaps bright yellow, or crimson, or scarlet, the ground colour being green or white, bordered with pink, blue, or some other colour. The rays are jointed, covered thick with bristling spines, between which are placed rows of suckers, which form the animal's means of progression. The movements of these creatures are well described by Mr Gosse. He speaks of them as 'deliberately crawling about by means of their five long flexible arms in a manner that seems a ludicrous caricature of a man climbing up by his hands and feet, only you must suppose an additional arm growing from the top of his head.' They look, however, very lovely as they glide about with their eccentric movements amidst the stones in your aquarium; but they are poor possessions, for they throw off first one leg, and then another, until but a button-like disk is left; or they curl themselves up, and die, before you can have kept them many days.

I had been so very busy looking at and managing my brittle stars, that I had seen nothing else of what the haul had produced, and the dredge was thrown over again, when my companion held towards me a glass bottle, and said: 'You know the pecten, do you not?' As he spoke, an animal in the bottle, which was contained in a bivalve shell about an inch in diameter, sprang up, and danced a regular *pas seul* in the water to his own music, for he dashed from the bottom to the top of the bottle by means of three rapid diagonal movements, in which, at each dash, he struck against the side of the vessel, and made it ring, and then descended in the same vehement manner, and, after a moment, repeated the same manoeuvres two or three times in succession. I begged that he might be transferred to my jar, and two or three more were soon added to the party, all of whom danced about in my

vases at home with such a clatter, as to quite startle me. Their activity, however, soon ceased, and, after a few days, their lives; but they were, whilst they lasted, amongst the most beautiful and interesting of my possessions.

Few people who have not kept and watched living specimens, have any idea of the beauty of the animal of the great scallop-shells that are sold in the markets for food. Between that pair of shells lies a creature which, for delicacy of structure and beauty of colouring, cannot be excelled in nature or art. As the lips open, you first see that there is a white pellucid fringe of tentacles round the inner edge of each, which wave about in the water. Some are long, and some short; but the longest is about the length of half of the diameter of the shell. The valves open a little wider, and you see that a row of brilliant diamond spots alternate with each of the larger tentacles on each edge of the shell. They are formed of a ring of diamond light, with a centre of gem-like hue, which in some aspects is green, and in others blue, but always of metallic lustre. These rows of eyes look like a double row of jewels; they are supposed to be eyes, but whether they really act as such, is doubtful. But the valves open more and more; filling up the space between the shells, and putting one much in mind of the pin-cushions which we have so often seen made with scallop-shells for covers, you see a soft, fleshy, and flesh-coloured veil, richly marked, and pencilled with chestnut-brown, its edge fringed with the delicate rows of white tentacles which I have described, and which, although they at first seem to spring from the edge of the shell, are in reality appendages of this organ, which is called the *mantle*. Leave the pretty creature quite in peace, and do not touch the jar so as to startle it, and you will presently see it gape more and more, the mantle open, and a lovely sight display itself. Within the shelter of the mantle are spread two filmy snow-white sheets, beautifully crinkled like the most delicate muslin paper, goffered in a mould fine enough for ornamenting the garb of a fairy; and snug between these dainty sheets rests the body of the little creature, for whose comfort, safety, and adornment the Creator has supplied such a wonderful and exquisite amount of workmanship. This little body completes the richness of colouring and beauty of the painted scallop (*Pecten opercularis*) most perfectly, for it is a smooth oblong lobe, like a bean, and of the most intense orange colour, which contrasts with the very pure white of the veil in a beautiful manner. The leaping, or, as I have termed it, dancing of this creature, is accomplished thus: as it lies on the ground with its valves open, it thrusts out a delicate white fleshy foot, and pressing this on the substance below it, opens the valves of the shell, and springs upwards. Gosse conceives this action to be performed by the animal's drawing in water, and forcibly expelling it again; by means of which contrivance it forms a pressure against the side of the water, and springs in the opposite direction—an idea that affords a satisfactory solution to the question which has often been discussed, of how the leaping shell-fish effect their movement.

The next haul of our dredge brought us more brittle stars, sand-stars, &c., and also more forests of sertularie, plumularie, laomedee, &c., and to me a great treasure in the shape of a huge nudibranch an inch and a half long, and of extreme beauty. It was of a pale dove-colour throughout, each side of the back being furnished with five feathery plumes, partially retractile; and as it moved about on its slug-like foot, or floated on the surface of the water by means of hollowing in this foot, so as to make it act as a boat, these plumes were ever in motion, waving about, twitching themselves hither and thither, and contracting and expanding at will in the most graceful manner. The back of this animal (*Tritonia Homborgii*) is covered

with large soft tubercles, its *veil*—as a prolongation of the body in front is termed—formed two large scallop-shaped lobes fringed at the edge, it had two massive tentacles like horns on its head, which rose from a sort of cup, and divided into bunches of branched filaments very lovely to behold. I kept it alive several days, and then, as my compact with my companion had been that I should have it in life, and he in death, I sent its body after it had died to him, that he might 'boil it down' and obtain microscopic objects from its debris. He found it to contain a most wonderful palate, furnished with such teeth as he had never before seen in any nudibranch; but what else it bestowed on him, I have not yet heard.

Another tiny young specimen of the same animal I found creeping about on the coral weeds, when I got home; and a most beautiful little creature, *Doto coronata*, also a nudibranch, crept out from the weeds, and charmed me by its graceful movements and elegance of form, as well as the novelty of its structure. Its green thread-like tentacles, two in number, and rising from the top of the head out of trumpet-like sheaths, were in constant wavy motion; along each side of its back were bunches of branchia, consisting of oval lobes seated on stalks, the substance semi-transparent, and set with circles of opaque tubercles round it, with a single one covering the apex. Its delicate white foot, covered with this curious body, looked very pretty as it crept about on the side of the glass, or floated at will, foot upwards, on the water. After I had kept *Doto* a few days, it laid a most elegant zigzag ribbon of pure white spawn on the side of the glass, and though dull and sluggish for a day before and after this operation, it is now in full life and vigour, although it has been some weeks in captivity. A curious thing in the structure of this and of most nudibranchs is, that you can see the pulsation of the heart with the naked eye, in a most interesting manner.

There was another most lovely object that came up almost every haul in large quantities; this was the 'dead-man's fingers' (*Alcyonium digitatum*). When this first comes out of the water, it exhibits the appearance of flesh-coloured smooth lobes, of unequal sizes, some as large as a clenched hand, others not bigger than a pea; the surface is marked with small pellucid stars. Put the mass you select in water, and watch it for a few hours, and you will see that it swells to double its former size, and becomes semi-transparent and of pure white, and that each of these starry marks begins to rise, and by degrees elongates itself into a pure white glassy flower; so that the whole surface of the substance is closely studded with tubular blossoms of most exquisite symmetry and beauty, each being about a quarter of an inch in height, and formed like the blossom of a lily. These all remain in full expansion, not retreating when touched, till the whole fades away together. Mr Gosse, in his *Naturalist's Rambles on the Coast of Devon*, gives a beautiful account of this mass of blooming jelly, and an elegant drawing of one of its polype heads.

It belongs to the family *Alcyoniadae*, from *alcyon*, a word which signifies 'sea-foam'; and truly, when this alcyonium lies thrown up on the shore after a heavy storm, it looks so like the flakes of foam which have been drifted about amongst the debris of the red conglomerate cliffs, until they have attained a red tinge, that I have sometimes mistaken the one for the other, and grasped at the yielding foam, in mistake for the solid alcyonium. It is dredged on rocks, stones, shells, or any other substance that has lain at the bottom of the sea for some time.

But alas, alas! long before we need have left our rich dredging-ground, the fatigue and excitement told on my not very strong frame, and to my great sorrow, I was obliged to 'cry craven,' and ask for a ticket of

dismissal. Homeward, therefore, we sailed; but ere we reached the Saddle Rock, the fresh sailing motion, a little rest, and a glass of wine, had so much recruited me, that my companions' suggestion of one more cast met with glad acceptance, and over went the dredge, and came back to us with a fine heap of sea-hares* (*Aphysia depilans*), and a few other matters, but nothing of much interest. I found some strange little white sea-leeches sticking to the side of my glasses by one end, the other being either stretched out straight into the water like a looper caterpillar, or else attached by its round sucker-aperture to a neighbouring part of the glass, so as to form a loop. Where we took these, I know not, as they, like the little *Doto*, crept out from the can as we went onwards; but I found one of them a day or two after acting the doctor, and phlebotomising a poor little *saxicava rugosa*, on whose body he had fixed, and on whose blood, or representative of that fluid, he was feasting—the consequence of which was, that my poor little stone-borer died next day.

It was now getting dusk, and we therefore sailed at once into harbour and made our way homeward, richly laden with booty, and well pleased with our day's excursion.

AT EVENTIDE.

WHAT spirit is 't that does pervade
The silence of this empty room?
And as I lift my eyes, what shade
Glides off, and vanishes in gloom?

I could believe, this moment past,
A known form filled that vacant chair,
That, here, kind looks were on me cast
I never shall see anywhere!

The living are so far away!
But thou—thou seemest strangely near:
Know'st all my silent heart would say,
Its peace, its pains, its hope, its fear.

And from thy calm supernal height,
And wondrous wisdom newly won,
Smilest on all our poor delight
And petty wo beneath the sun.

From all this coil thou hast slipped away
As softly as the cloud departs
Along the hillside purple-gray—
Into the heaven of patient hearts:

Nothing here suffered, nothing missed
Will ever stir from its repose
The death-smile on her lips unmiss'd,
Who all things loves and all things knows.

And I who, ignorant and weak,
Helpless in love and quick in pain,
Do evermore still restless, seek
The unattainable in vain—

Find it strange comfort thus to sit
While the loud world unheeded rolls,
And clasp, ere yet the fancy flit,
A friend's hand from the Land of Souls.

SATURDAY, MAY 30, 1857.

PRICE 1½d.

THE ART PALACE AT MANCHESTER.

THE great, smoky, busy city of Manchester has at length done a thing which, for a time, must make it the most observed place in England. Its Art Treasures Exhibition is a spectacle such as the world has never before seen—never, indeed, has been in circumstances to produce till now. Imagine that, leaving the murky town behind, you come out westward into a country of wide-spreading green meadows, interspersed slightly with villages and groups of pleasant suburban residences: there, beside a railway, rises a large building of peculiar aspect, reminding you generally of the magical-looking Crystal Palace of Hyde Park, with a gay-coloured front in three lofty arches, where carriages are continually arriving and departing. This is the Art Treasures Exhibition of Manchester—a temporary palace, we may say, reared for the purpose which its name in some degree expresses. England, it has been declared on high authority, possesses not merely a great body of works of art, the product of its own genius, but the greater number of all the fine pictures that have been produced by foreign artists since the revival. To assemble these from the private and public galleries amongst which they are dispersed, in one great place, where you could at once see and study what it would otherwise take months to visit, and what practically it was impossible otherwise for any one to see, was the idea conceived by the originator of this singular spectacle, Mr J. C. Deane, and which the Merchant Princes of Manchester—wisely deeming it a worthy task—have worked out. The result is one which could only have been realised in a country or province of great wealth, and in a time of peace, prosperity, and general mutual amity and good feeling throughout the various sections of the community. As to the preparation of the house, there were 109 men of Manchester combining to guarantee the sum of £72,500 for expenses—thirty-six of them undertaking £1,000 each! On the other hand, the object being the gratification and improvement of the People, the People of the whole country, there were nobles and men of wealth everywhere agreeing to take down the most treasured works of art from their walls, that they might be gathered together here; and, finally, undergoing, it must be admitted, some inconvenience, and even encountering the risk of great irreparable loss. When we consider these circumstances, we must be prepared to own that even the splendours of the place scarcely come up to the general considerations connected with it. One feels that it is symptomatic of a social suavity as connected with the onward march of industry, seeming to indicate

that our community, diversified as it is in pursuits and conditions, is still at heart one—the English People.

The house may be described as consisting of one central arched hall, 632 feet long, by 104 broad, and 56½ in height, crossed near one end by a transept of 200 feet in length, being thus so far in the form of a great cathedral; the small part beyond the transept being occupied wholly as an orchestra. The spaces left by the cross form of the building are, however, filled up by side-saloons, corresponding to *aisles*; so that the entire area occupied is a strict parallelogram in figure. The arched ceilings of these various apartments have a space glazed for the admission of light. Entering at the east end, we have the fine vista of the central hall full before us, terminated in the remote distance by the ornamental front of a large organ. Rows of statues, of figures in ancient armour, and of glazed cases for articles of ornamental art, run along in double line; while the walls on both sides are clothed to a great height with pictures, being the portraits of the historical personages of England. In the side-saloon to the left are hung 1100 pictures by ancient masters. That on the right is filled with the choice productions of our own national school. In a suite of smaller apartments at the west end, are upwards of a thousand of the finest water-colour drawings by English masters, including more than fifty of the *chefs-d'œuvre* of Turner. There is also a gallery around the transept and adjacent parts of the nave, containing an immense assemblage of engravings of all ages, besides numberless photographic miniatures. The general effect is gay, impressive, and beautiful.

Great was the excitement in Manchester when, on a gray day of May, with a cool east wind blowing, one who is in a sense 'the Prince of all the land' came to formally declare this magnificent exhibition open to the public. The streets, particularly those near the Art Palace, were full of the children of Labour, dirty but good-humoured, all eager to catch a glimpse of the royal visitor and the other distinguished persons concerned in the ceremony. Within the house were assembled perhaps 8000 ladies and gentlemen, nearly all of them holders of costly season-tickets, for such was the mode of selection adopted, in order that the crowd might be kept in moderation. Round a dais surmounted by a throne, in the centre of the transept, stood a row of ambassadors and English nobles, mingled with native gentlemen concerned in preparing the exhibition, several of whom wore court-dresses or the military uniform suitable to their character as deputy-lieutenants of the county. The scene was one of the utmost brilliancy and grace, chiefly by reason of

the abundance of ladies, who were in general attired in a style of elegance which seems to be in some degree peculiar to rich mercantile communities. There was nothing remarkable in the ceremonies of the occasion. The Prince stood modestly up while listening to and replying to the various addresses brought before him by official persons. The Bishop of Manchester read an appropriate prayer; and the orchestra gave the Queen's Anthem and other airs with thrilling effect. Every outward demonstration sank beneath the sentiment of the affair—the consideration of what had brought all these people together, and what might be expected to result therefrom.

The study or enjoyment of the exhibition itself, we found to be a matter for many days, and still the treasure was left unexhausted. Somehow one finds that he cannot live upon pictures alone. After an hour spent in surveying some particular department, he is glad to come to the transept, and take a seat beneath the orchestra where Mr Halle is trying to regale another taste; or mayhap he lounges to the refreshment-room for the sake of a sandwich or a jelly wherewith to restore his flagging strength. Then he goes back again, catalogue in hand, to the pictures, pastures his senses upon them for another hour, and then requires another interval of relaxation. So a day passes, and at the end one is rather surprised to find how little it has accomplished in making himself acquainted with the innumerable articles submitted to his gaze. Perhaps the most rational course of procedure is to go to the ancient masters first, and there trace the art from its rude and simple beginnings in the fourteenth century down to its glorious perfection in the sixteenth. The subjects being for the most part expressive of the religious ideas of a form of Christianity out of which we have advanced, are apt to be of little or limited interest to us. But viewing the matter simply with a regard to the human faculties concerned in art, it is certainly curious to observe the progress made from the stiff, hard, irrelative figures of the times of Cimabue and Giotto, to the fine compositions and colouring of the days of Michael Angelo, Raphael, and Leonardo da Vinci. And for this study, materials truly ample are here presented. Then come, in sections by themselves, groups of the works of Tintoretto, of Murillo, of Rubens, and his Flemish associates, shewing how art was affected by national peculiarities and tendencies. There chances to be an uncommonly large assemblage of Murillo's—no fewer than thirty-five—including his portrait of himself; and perhaps no special group in the exhibition is calculated to make a deeper impression. The feeling which this prince of the Spanish school imparts to his faces seems of unapproachable truthfulness. One looks with reverence on the earnest, genius-lighted face of him who could create such images of beauty, to be 'a joy for ever.' Of Raphael there are twenty-eight pieces, gathered out of nearly as many collections. Titian is represented by thirty works, amongst which will be found 'The Adoration of the Shepherds,' a picture formerly belonging to the collection of Charles I. Rubens appears in great force. His famous 'Rainbow Landscape,' formerly in the Balbi Palace at Genoa, now in the collection of the Marquis of Hertford, is here; so also is his magnificently terrible 'Prometheus tortured by the Vultures.' His contributions are in all forty. Vandyck, Teniers, and Rembrandt are all brought before us in scarcely less abundant illustration. It would be endless to speak of particular works.

The paintings of modern British artists afford, of course, an opportunity of judging whether we have advanced, in this art, upon the continental men of the middle ages. In point of general worthiness of subject, there can be no doubt of an improvement; and if the opinion of an individual were of any account, we should be inclined to say that, overlooking a few gems

of the past, the workmanship has advanced also. However this may be, we have here a series of large saloons filled with the very choicest pictures produced amongst us since the beginning of the last century. The choiceness is verified by one circumstance of which many may judge—namely, that so many are pictures from which we remember having seen engravings. The connoisseur has another proof of the fact, in recognising so many that have been the works of mark in the successive National Academy exhibitions of the last few years. It is evident, from the crowdedness of the rooms, that this is the favourite part of the show, so far as paintings are concerned. To come to particular masters—there are several of the prime works of Hogarth, including those singular comicalities, 'The March of the Guards to Finchley,' and 'the Southwark Fair.' There are many portraits by Sir Joshua Reynolds, and a few of his miscellaneous pieces. Gainsborough, Romney, Opie, and West, give numerous specimens of the age of the Third George; while Lawrence, Stothard, Constable, Collins, and many other artists of the ensuing reign are not less abundantly represented. Of Wilkie we have here all the chief of those wonderful domestic pieces which have given him such celebrity—the 'Blind Man's Buff,' the 'Rent Day,' the 'Distraint for Rent,' &c.—besides several of his less happy, but still elaborate efforts in the historical line, and a portrait of his father and mother—the former in every respect the dounce Scotch country parson; the latter, exactly the kind of person whom we might have expected to remark, as she is said to have done, when she heard her son David so much spoken of: 'I wiss they saw Andrew;' said Andrew being a good-looking young grocer. There are many works of Etty, of Landseer, of Leslie, of Danby, MacIise, Frith, Stanfield, Ward, and other men still or recently alive. That happy joke by Landseer, styled 'Alexander and Diogenes;' also his 'There is Life in the Old Dog yet'—a grand work—arrest universal attention. The pitying eye is drawn irresistibly by Ward's 'Charlotte Corday led to Execution.' Roberts is here with his magnificent interiors of cathedrals. George Harvey, Sir John Watson Gordon, Graham Gilbert, Faed, and others of the northern school, occupy the breadth that is due to their signal merits. Here, in especial, is Gordon's wonderful piece of life, 'the Provost of Peterhead,' the very essence of Scotch sagacity and humour. Here, too, is Gilbert's beautiful portrait of Sir John himself, in a court-dress; here, too, the exquisite 'Dr Wardlaw' of Macnee. To any one conversant with the works of modern artists, it is like a meeting with old friends—old friends, many of whom have been for years lost to sight, imprisoned in distant private galleries or otherwise; here miraculously, and past hope, brought together before our eyes again, all as pleasant to look on and converse with as ever. If so enjoyable in recognition to the simple public, how much more so must many of these pictures be to their authors! It is one of the sad conditions of a painter's life that the cherished work of his talents leaves him; and only too glad is he when it does so, never perhaps to be seen by him more. Imagine the feelings of an artist on coming hither, and finding several of his most favourite pieces, parted with perhaps twenty years ago, and not since beheld even once, or expected ever to be seen again. The accomplishment of such reunions seems to us one of the most agreeable circumstances resulting from the exhibition.

The department of British historical portraiture, occupying the principal part of the side-walls of the nave, forms in itself a peculiar and unique exhibition which it would have been well to form, even if alone. It commences with portraits of Richard II. and Henry IV., and goes on through the thirteenth

succeeding centuries, bringing before us the principal royal and other personages who have figured in the more picturesque and romantic part of our history. Henry VIII. and Elizabeth, with the chief men of their courts, are largely illustrated. So are the family and court of Charles I., whose portrait by Mytens, going out to hunting with his queen and the dwarf Hudson, is an especial gem. There is a copious series of the frail beauties of the subsequent reign, painted by Lely. The chief ministers, warriors, and men of thought of the seventeenth and first half of the eighteenth centuries are here—and no small gratification it is to observe in them those particulars of complexion, colour of hair and eyes, which we look for in vain in the engravings of Houbraken and Lodge. In some instances, the portrait itself may be said to have a history. For example, that of Lord Falkland—the Falkland of Clarendon—full-length in a remarkably pale style, which, being in the possession of Horace Walpole, suggested to him the figure walking from the frame in his *Castle of Otranto*. As another instance, we have the identical picture of the Infanta of Spain which the Duke of Buckingham brought from Spain, to recommend her to the hand of the Prince of Wales, afterwards Charles I. Still another—one of the celebrated portraits of the Kit-cat Club, painted for Jacob Tonson the bookseller, has been contributed by Tonson's representative, Mr Baker. The catalogue of this part of the collection has been prepared by Mr Peter Cunningham, with large benefit from his secular knowledge of English biographical anecdote, many of the articles having notes appended, briefly but judiciously pointing out some interesting particular as to the subject, the artist, the circumstances under which the portrait was painted, or its subsequent history. Thus, with reference to Jonathan Richardson's portrait of Matthew Prior the poet, a letter of Prior to Swift, dated May 1720, is quoted: 'Richardson has made an excellent picture of me, from whence Harley (whom it is) has a stamp taken by Vertue.' This title sentence, it will be observed, brings before us at once the satisfaction of the poet with the portrait, and the fact of its being done for his friend and political associate, the Earl of Oxford. In some instances, men historically connected with each other, are curiously brought together on these walls. Boswell figures beside Johnson; Lockhart succeeds Gifford, as he did in the *Quarterly Review*. Between a pleasing pair of heads, Prince Charles and his Clementina Walkingshaw, stands a small full-length of Rob Roy, represented with his broad-sword in his hand, and his target on his arm, as he might have appeared at Sheriffmuir. There is a melancholy interest in the fates of many of the historical personages here depicted; and it is curious to cast the eye along the wall and say: 'Here Charles I.—beheaded: here is his friend, the first Duke of Hamilton—beheaded: here is the Marquis of Huntly, a prince in his own land, and a steadfast friend of King Charles—alas! also beheaded. There is the Earl of Derby—beheaded. There is the Duke of Buckingham—assassinated. Here stands Hampden—slain in battle. Here is Cromwell, whose fate it was, after being virtually monarch of England, to be dragged from the grave, and hung on a gallows!' Not so impressive is it to turn to the many of comparatively little worth—self-indulgent, perhaps profligate—who lived through all their days in unmerited ease, and came to gentle deaths at last. We may hope that, in the larger catalogue which is preparing, we shall have the means of drawing many a moral reflection from this part of the exhibition, not to speak of the historical knowledge which, when duly treated, it is fitted to impart.

The two rows of statues, which line the central avenue in the nave, as examples of the modern British school of sculpture, may perhaps be thought limited

and deficient in variety; but they include several of the works which have made the greatest impression on the public. We need only mention Baily's 'Eve at the Fountain,' Calder Marshall's 'Ophelia,' Gibson's 'Narcissus,' Westmacott's 'Peri,' and Lawrence Macdonald's 'Bacchante,' to shew the nature of the collection. Their effect as objects in the general view of the nave is extremely fine.

There remains to be noticed a department of the exhibition which would require an article to itself—indeed a volume might be written about it—and yet we can give it only a few sentences. This is the Museum, as it may well be called, of ornamental art, occupying a double series of glazed cases behind the rows of statues. The beautiful crystal articles which were made at Venice in the sixteenth century, curiously decorated with internal lace-work or the most exquisite outward carving—the rich porcelain of Holland and France—the superb goldsmith-work of the middle ages—the numberless kinds of decorated utensils and furniture which used then to adorn great mansions—the arms and armour of the heroes of those days—are all here largely exemplified. One may spend hours over a single case of these valuables, many of which are unique. We must not name a single specimen, for it would be simple injustice to the rest; but we cannot pass from the subject without remarking the liberality of the directors with reference to this section. M. Soulagès of Toulouse had devoted himself, some years ago, to the collecting of articles of ornamental art, chiefly in Italy, and he had been highly successful. Finding latterly the taste for such objects advancing, and their value increased, he offered his collection for sale. It was bought by a set of English gentlemen, who trusted that it might be finally taken off their hands by the English nation, with a view to the improvement of art in our country. Being disappointed in this hope, they were on the point of selling it off by auction, when the committee of the Art Treasures Exhibition came to the rescue, purchased the collection, and placed it here. For a time, then, the hammer of destiny is suspended: the Soulagès collection may yet be kept together.

And now, good friends, you know something of this great affair which has sprung up at Manchester. Live you near or far, we recommend you to try to pay it a visit. It is literally 'such an opportunity as rarely occurs;' indeed, it never occurred before in the world's history, and no one can say how many years or generations may pass before it can occur again. Let, then, no light obstacles stay you. Go—go with your wives and children—take with you all over whom you have any influence, to see, to study, to profit by this wonderful assemblage of the works of fictile genius. You will infallibly return wiser and better men.

PEASANT-LIFE IN SYRIA.

THE first dawn of day is ushered in by the cry of the goat's-milk vendors. 'Haleel il Gitchi' (milk of the goat) is the sure accompaniment to the clamour of early sparrows and equally noisy crows. We look out of the window, and see some half-dozen milch goats coming up the street, driven by a couple of village maidens, whose bare and dusty feet give indication of their having walked far before reaching the city-gate. If we had slept at their village last night—as we sometimes have done when travelling to and fro—we should have been awakened a good two hours before daybreak, by the bustle and noise in the household. In the first place, we had all slept under one roof, sometimes under one tent—the master and mistress; the sons and daughters; the stranger that chance may have thrown upon their hospitality; the old horse that carries produce to market, or fetches the weekly supply of fuel; the yoke of oxen the son

drives before him in the plough; the long-bearded goats that supply milk enough for the household, in addition to yielding a very fair return from the nearest market; the hens that give profit and food by their eggs—all these, besides the poor old donkey and the invaluable dog and cat. The good man of the house is therefore at no great expense in building chambers and bedrooms, stabling or pens for cattle; and his haylofts and warehouses are arranged upon a like economic principle. The house, which consists of four mud-walls, is of an oblong shape, with one central door and two small windows on either side of it. At intervals there are niches in the wall, which half-an-hour's labour might convert into windows; but the peasant has built his house with an eye to warmth and comfort in the winter. What does he care about the heat or the fleas in summer—*Ilhumel, illallah!* He has a court-yard paved with hard manure, and nearly ten yards wide; here, if the weather be oppressive, the daughter sweeps all up at sunset, and spreads a few mats; which mats first serve as a supper-table; are then taken up and shaken in the street, and being replaced, the mattresses are spread upon them for the night, and so the house is left entirely to its dumb occupants.

But to return to the structure of the building. The length of the room may be twenty feet; its breadth, twelve; its height, on a level with the side-walls, four feet; but the two end-walls rise considerably higher, and terminating in a cone, support the principal beam of the sloping roof, which is a thatched one. A brilliant idea struck the ancestors of our peasant some forty generations gone by; and it has been handed down from father to son, and acted upon by them all. No one but a *myינוון* (madman) would ever want to stand, or, at any rate, walk upright in his house; if he wants to do this, he can go out into the yard: he must be a tall man if that won't suit him. So argues our peasant; and as timber is cheap, he has laid several beams across from the side-walls, which, having planks laid loosely over them, with an aperture here and there, constitute an up-stairs loft, and are exceedingly beneficial during very heavy showers of rain, in keeping out some portion of the wet. Most houses in the East are not famous for their water-tight qualities. This loft is devoted to a great variety of useful purposes. Here is accumulated the winter-supply of fodder for the cattle; here also are warehoused onions, garlic, dried herbs, succulent roots, cheese, *burghul**, figs, walnuts, dates, and other indispensable necessities of the peasant's domestic economy; here, moreover—at least so it is whispered by his spiteful neighbour, 'Hadji Phistook,' the *Salbund*†—the peasant is more than half suspected of owning concealed treasure; nearly a dozen gold pieces, wrapped up in as many folds of rags, and carefully stowed away under the thatch-work. This rumour probably owes its origin to the fact of the peasant never suffering any one to ascend into the loft, unless accompanied by himself. Upon such occasions, an old ladder is set up with great ceremony, and verses from the Koran quoted aloud. Furthermore, the peasant has been detected up there after midnight, when all the rest of the family were supposed to be asleep. We are bound, however, to give full credit to his own explanation of his anxiety to keep intruders from the loft. None of the planks being nailed down, he is fearful that the women or children, by carelessly stepping on the ledge, might overbalance a plank, and entail destruction on a month's provisions—to say nothing of broken limbs, and so forth.

Well, we are supposed to have passed the night under such a roof. I would not compromise fact by saying

that it has been a comfortable night for ourselves; not being accustomed to such strange bed-fellows, this could hardly be expected; but the peasant and his family have enjoyed invigorating and undisturbed rest, and so, after their own fashion, have the other occupants of the hut. It is somewhat past four a.m., and the cocks of the establishment, which with the hens, as is their wont, have roosted in the loft, smell the morning, and forthwith crow vehemently. This is the signal for the eldest daughter to bestir herself; when she wakens her mother and sisters; and these women begin in earnest to set about the business of the day. The men are permitted to sleep for an hour longer, and the children as long as they can; they are hungry and clamorous when they awake, and only impede the progress of work.

One girl devotes herself to the goats: first of all, the kids are allowed to suckle, more to encourage the flow of milk than for their own sustenance, for they have barely had a mouthful or two, before they are dragged away and penned up somewhere in the court-yard. Then two or three goats are fully milked for the immediate use of the household; these are separated from the remainder, and will go out to pasturage with the kids by and by. Meanwhile one has been gathering up the unoccupied mattresses, which she carries away and hides in a recess; another has swept up as much of the floor as she can get at; a third gives fodder to the oxen, the horse, and the donkey; a fourth lights the fire and prepares the morning meal, consisting principally of boiled goat's-milk, for the household; and a fifth sits down and kneads the bread for the afternoon's consumption. When all these little tasks have been accomplished, the peasant himself wakes up, and shouts lustily to his son that another day of heat and labour has commenced. The son, yawning and stretching himself, unwillingly obeys the summons: his first care is the cattle, and he rubs these down with a wisp of straw; then he opens the door, and looks out sleepily, more than half persuaded that he has been called at midnight instead of early dawn. The cool breeze and the stream of dull light that pour in convince him he is in error; wherefore, to make amends for his loitering, he hurries on the breakfast, and, so as not to lose time, commences an onslaught on whatever may be ready.

All the cocks and hens fly down screaming with delight from their roosts, and rush through the open door into the welcome day. There they are very noisy over their early scratching; and one old cock, who is the pink of gallantry, cackles mightily to his twenty wives over some unhappy grub that his sharp claws have brought to light. The old man seats himself with his morning pipe, soliloquising possibly on the mutability of human affairs. Here is he, *Alley Ben Ahmed*, who only twenty years ago was an out-o'-door lad in a cottage not half as big as his own. By perseverance and toil he has accumulated quite a fortune. His own house, his own wife and children, his goats, his poultry, his cattle, and his—No, no; he has no hidden store; he won't admit that fact, be it ever so well established. The contentment of his face might betray it to some wealthy neighbour—some Turkish official. The idea is horrible, and he instantly relapses into the groaning, oppressed, ill-used *vassal*, you would suppose him to be, if you saw him only in the streets.

Presently, after the morning ablutions have been carefully attended to, the family eat heartily of this frugal fare; then the two elder girls, armed with milk-pots and a switch apiece, drive the goats before them, and take their way to the distant town, where, if they are early and punctual, they may count upon earning a pretty good supply of piastres. But you have no conception of the difficulties these girls have to overcome, even after they have entered the streets of the

* Ground boiled wheat.

† Native farrier.

town. In the first place, the path they have to follow takes them out of the village, right away over an extensive heath, where brambles and briars grow luxuriantly, and where, as a natural result, it requires no little running about and screaming, no mild infliction of their switches, to induce the goats to keep together or to go ahead at all: they have a natural propensity to briars, and will stray on every available opportunity. Not a few thorns do these poor girls pick out of their feet, when compelled to run in amongst the heather to drive back some obstinate animal. But they are used to this kind of work; and the naked soles of their feet, from constant exposure, are as hard as ordinary shoe-leather. Eventually, the city-gates are reached, and as the general dust-heap is the centre of the streets, the poor goats have great temptations held out to them in the shape of melon-rinds, cabbage-stalks, and other garbage, all which they will persist in investigating, despite the threats of the two damsels. The goats stop as naturally from the instinct of habit opposite the doors of regular customers; what remains of the milk is disposed of in the market-place; and by eight o'clock the two maidens are driving their flock homeward again; the goats trotting all the way, although the heat is already intense, and the flies an insufferable plague; and so the poor girls reach home out of breath and weary, and, seated on the shady side of their hut, hand over the morning's gains to their father, exacting, as each coin is doled out, a renewed promise from the old man about red shoes for the approaching festival.

But whilst these have been absent, what has been going on in the village? In the first place, the peasant has had his morning survey of the loft, for the purpose of handing down to his careful spouse the daily rations for household consumption, which done, he places the ladder on the roof of some outhouses, far beyond the reach of the women. He then goes to the village coffee-house, which is not much of a building, being nothing more or less than a large tree in the centre of the village, with a thatched cover suspended from its boughs, and rough wooden benches round its roots. Here are congregated all the worthies, inclusive of the Salbund, who has a couple of nags to shoe for the kekhiah. The compliments of the morning are interchanged, coffee drank, and then the benches are cleared away and the place converted into a magistrate's office, till close upon mid-day. There are seldom many cases to occupy the court. One or two minor felonies of eggs, a charge or two of assault, and the calendar is closed. Then the kekhiah and the elders pass the time in playing backgammon and talking politics. Sometimes there are large committee meetings to discuss the iniquities of some fresh imposed tax; but however important the subject may be, the parties disperse just before noon, and return to their respective homes for their mid-day meal, which is a substantial one, qualified with large draughts of cold spring-water.

But whilst the head of the house has been absent, the women indoors have had no sinecure. The whole place, inside and outside, has been swept and well purified with water, the windows have been thrown wide open, the fire indoors has been extinguished, and lit out in the yard; the hens have been driven into a hen-house, and have noisily proclaimed every addition to the stock of eggs; the children have been stuffed to repletion, washed, and turned out into the fields to play; the youngest girl has been to the butcher's, and brought home the scraggy-looking joint of an ancient ram, which is forthwith mashed up in a pestle and mortar, and transformed into their much-liked koobays. Another girl has been to the kitchen-gardens—for all the peasants have little spots cultivated near their fields—and though the winter is on the ground, seed-time and harvest gone by,

there is abundance of onion-tops and wild marsh-mallow; and these two cooked together, and then fried in fresh butter, constitute a savoury and a wholesome repast. But in addition to this, there are the burghul and the khobies, the pickled chillies, cucumbers and turnips; the beckmege and dried fruits by way of dessert, so that the whole family has a substantial repast. The mother cooks for the whole family. The eldest daughter takes a large earthen jar, which she fills with milk, and then hermetically closes; seating herself with this between her knees, she shakes it to and fro for a good hour and a half, by which time the butter is produced, and her arms ache again with fatigue. Another daughter turns laundress, for the extent of their wardrobe is limited to a single change, and they are consequently obliged to wash every alternate day. And a very astonishing lot of linen is hung out to dry in the court-yard: papa's inexpressibles, which are only ten yards wide, ever so many folds; baby's toggery, which, like Joseph's coat of old, presents a remarkable mixture of colours and patch-work; and many other strange-shaped garments. The third daughter has been up to her eyes in needlework—just putting a few fresh patches into the brother's everyday coat. And when all these have done their respective tasks, a heavy shadow falls upon the entrance-door, and the old man walks in hot and hungry. Two minutes afterwards, the son drives in his yoke of oxen, and deposits his plough against the court-yard wall. The oxen lie down in the shade and ruminate. The son, who is exceedingly exhausted, washes his hands, and feet, and face, and then sits down to dinner with an appetite worthy of an alderman—in this respect, they are all pretty well off—and having dined, the dishes are washed up, and the mats shaken. The two men fill their pipes, and sit under the shadiest wall; the wife fetches them out a pillow apiece; and half an hour afterwards, when the heat of the day is intense, all the family go into the house, and closing doors and windows, enjoy an afternoon siesta.

It is good two hours after mid-day when the family are astir again. Then the son goes back to his work, and the old man loads his horse with a few bushels of wheat, which he intends carrying to a neighbouring village, to barter for cotton and other stuffs necessary for household uses. He drives the horse before him, and bestrides the donkey himself; and, as he may be several hours away, all the neighbours turn out to see the old man off, and wish him as many good wishes as though he were going a journey of a hundred miles instead of two.

The younger girls go out to look after the goats and kids. The elder one carries her butter to the town she visited in the morning, where she leaves it with a shopkeeper who always buys her produce. The children are sent to an afternoon school, where a fierce old mufti in goggles teaches them, with a very nasal twang, selections from the Koran.

The sun sets in the west; larks and feathered songsters gather together in the hedges, where the peasant's son has been ploughing wearily through the sultry afternoon, and they wake up echoes far and wide as they raise their grateful vespers for the blessings of another day. The young man shoulders his plough, and driving the oxen before him, plods homeward for supper and rest. The anxious children catch a glimpse of the old man coming in the distance, and they shout lustily, for there are sweetmeats in perspective. The old horse is carefully rubbed down, the saddle-bags unpacked, and out of these come sugared almonds for all the youngsters, who are in perfect ecstasies at the treat; but, above all, there are the promised red shoes for the two daughters, who have worked well and bravely, and merited the prize. The supper is partaken of in the open court-yard. The cocks and hens,

the dog and cat, all assist at this meal; the former committing frequent felonies on the portions of the smaller children. Darkness gathers around, and the peasant and his family retire for the day; they have all worked hard and wearily, and sleep needs no second courting to close their eyelids in healthy slumber.

A PHILOSOPHER EN ROBE DE CHAMBRE.

At the time famous Professor Scaliger was prelecting at Leyden University—that marsh among the marshes, as he pleasantly terms it—it came to pass that two young gentlemen of the family of Vassan presented themselves one morning before him. They were but newly arrived, and bore letters from their mother praying for them the advice and countenance of the terrible critic. They were also fortified with introductions to Casaubon and other magnates of the university, whose attentions were perhaps limited to the scanty measure that has found favour with ‘dons’ of all countries and all ages. But the grim professor soon took a fancy to the young men. They were eager and respectful listeners, and soon came to be privileged with what is known as the run of the house. They were to be met there at all hours of the day. At meals, and after meals—all through the long evenings they sat and hearkened while the professor spoke on, and, like Coleridge, delighted exceedingly in the sound of his own accents.

It is not to be supposed that our demure students were idle all this time. While the unconscious philologist was holding forth upon men, manners, books, everything, in short, it never entered into his head that the listeners at his feet were playing the same rôle as Boswell had done in Bolt Court, or O'Meara at St Helena, and the Rev. Mr Dyce so lately at Samuel Rogers's breakfast-parties. When he had been pouring forth, for hours together, all his secret griefs, his little animosities, his vindictive epithets, and nicknames, he little dreamed that the simple, open-mouthed chiefs before him were takin' notes—mentally, at least—which that same night would be written down against him in the retirement of an upper chamber. Poor Professor Scaliger! how he would have stormed and raved, and showered on them his favourite epithets of *four, fat, and one!*

When they had run their academic course, the young men went forth upon the world, bearing with them in their mails a certain manuscript volume filled in the questionable manner we have described. It was not to be doubted that, having sat at the feet of so great a man, they would turn out shining lights in their generation. But soon an ugly rumour was noised abroad; soon a grievous scandal was wafted across the marshes to the walls of Leyden. The two chosen ones had proved but rotten branches after all, and had fallen away from the true faith. Worse than that, one had assumed the cowl in a monastery near Paris, where for years after he was visited by the curious and the learned.

Later, it was whispered about that there was in existence a volume of the great man's sayings and opinions—of most piquant flavour—and lying perdu somewhere in Paris. Instantly the whole world of savans and bibliophiles became wild with excitement. It was begged, borrowed, greedily devoured, passed from hand to hand, and, as it afterwards appeared, often transcribed; and not very long after, an intelligent pirate at La Haye—in those days, a famous Riff station for pirate booksellers—issued a neat hot-pressed edition, bearing title, *Scaligerana*.

A strange book it is, written in a composite dialect, half French, half Latin. A singular kind of *argot* is the result, which is not, however, without a certain

force and nervousness characteristic of the man. Let us now suppose him seated with his two admiring pupils at his feet, and ready for a long, quiet evening. True, outside it is not altogether so quiet; for, as he once sorrowfully told them: ‘In this place every one may disturb his next neighbour with impunity. They come and riot under my very windows, and I can do nothing to stop them.’ [Where were the proctors?] ‘Even on fast-days, they drink all day long, even from sunrise.’ With all these *désagréments*, he is pretty well contented with the university. The only drawback is the loss of all his teeth—no doubt owing to the marshes. This was the more provoking, that there was to be seen in the town a stately dame who was fully ninety-nine years old, and yet boasted a handsome set. But why not have recourse to the cunning artist who fitted the Italian nobleman with a fine ivory set in gold mountings? True, he would have to take them out at meal-times, which was an objection; and when he spoke, he would have to be putting his hand continually to his mouth to prevent their falling out, which was a further objection. So, perhaps, on the whole, he was quite as well off as the Italian nobleman.

The great scholar, albeit so devoted to his books, had travelled and had met with a few incidents worth noting. He had seen Mary Queen of Scots, whom he rapturously allows to have been *une belle créature*. He had had an interview with the great Henry of Navarre, who had been pleased to make him the following remark: ‘Hold your tongue, monsieur; you don't know what you are talking about.’ He took a peep into the royal library, and found the romance of *Amadis* reposing between Plato and Aristotle. Of his queen, too, he has something to tell. A certain *Sieur de Montpesat*, who was a paragon of impudence (*le plus glorieux vilain*), met her at the baths of Béarn. ‘The queen said to him: “If I did not hold in all honour the king of France, your master, I should drive you from my domains sooner than you wot of!” Said he: “Madame, I need not go far for that.” Then she: “Begone, sir, this instant!”’ For this smart repartee, his own uncle volunteered to put him to death; but the queen generously interfered. Indeed, there appears to have been in those days a rather summary mode of dealing with all offences. Thus, one unfortunate, named Spifame, was publicly executed for having been so indiscreet as to take a lady into his house whose husband happened to be still living. When he himself was at Geneva, a frail fair one was put to death by drowning. ‘She was very pretty, and a brunette,’ he adds. ‘All the ministers cried hard over her. So M. de la Tremblay told me, for I had not the heart to go and see the execution.’ However, he once went to look at two men broken on the wheel, ‘one of whom spat out as far as any other man could do, laughing heartily all the time at his companion, who was screaming under the blows.’ He seems to have had a morbid fancy for this subject, and is curious in scaffold lore. Thus: ‘There was an executioner at Geneva called *Maistre Louis*, who was no other than a noble gentleman of Savoy, who had taken to this craft to spite his brothers, who had kept him out of his inheritance.’ The *Bordeaux Calcraft* had grown so skilful from long practice, ‘that very often the head remained upon the shoulders even after the blow!’ The gentleman who filled that office at Paris was quite as dexterous; he had only to let his sword drop carelessly, and the head and trunk were parted. At Venice, they had something very like the guillotine. ‘The criminal places his head upon a block, and upon the back of his neck is laid a blade of iron, very sharp and heavy. It is then struck smartly with a hammer, and the head is severed like a piece of wood.’

It is impossible not to suspect the great artist of a

little weakness for the good things of this life. How he yearns after the flesh-pots of Chambery! 'O what good cheer,' he says, 'we had in that town! Bread, wine, fish, all of the best! but the attendance, only indifferent. O the excellent wine, bread, and fish they eat at Chambery. Far better cheer there than at Geneva! In no part of the world have I seen a market to compare with it—plenty of everything!' At Bordeaux they have excellent wheaten bread. The Gascons make delicious bread. Still Bordeaux must, on the whole, give way to Perigueux. There, the living is admirable; and also at Agen, far better than at Bordeaux. Still Perigueux had its drawback. There are spots upon the sun, and the cloth table-linen was not of the cleanest; so that, perhaps, it is to the Grande Chartreuse that he looks back with fondest regret; for there they live on claret and white wines, and serve up astounding omelets of a hundred eggs each! Languedoc, too, is a land running with milk and honey; for there is to be found the best oil in the world; not your common nut-oil, which, though used in the king's kitchen for dressing fricassees, still wants the delicate flavour of the Languedoc virgin oil with which they season their exquisite soups. Discoursing in another place on mutton, he once more fondly recurs to Languedoc, where it is unsurpassed. It seems there is a peculiar flavour about the Languedoc mutton owing to the sheep being fed upon thyme. 'O what delicious eating!' he exclaims with rapture. The university mutton was only pretty good; it had a disagreeable hircine taste, which could only be got rid of by keeping it a long time in pickle. But of all dishes in the world, commend him to a green goose and garlic! This he pronounces fare for a king!

The great scholar had a smart trenchant way of disposing of those who ventured to differ with him. For instance, a certain man of the name of Snellius, 'came once to tell me that I was all astray in not reckoning dates after his method. I soon sent him about his business, with this answer: "Ass! why should I reckon dates after your method?"' This was like Mr Willet's manner of tackling Solomon Daisy.

An author, bearing the singular name of Popma, is thus despatched: 'Popma has written wretchedly on Varro. O what miserable criticism that of Popma! With all he has written, he has only just been gathering so much dirt! What a butt I made of him at Geneva!'

Poor Popma. The Emperor Rodolph is an utter hog; a certain Robertelli is found to be an ass, a beast, and a grand *rattiseur*; while the Jesuits are, one and all, written down asses, fools, pedants, *fats*, devils incarnate.

One night the professor saw a ghost! He shall tell the story himself. 'Devils,' he says, 'only shew themselves to poor weak souls. They would take good care of coming near me, for I would destroy them, every one of them. When they appear to sorcerers, they take the shape of a goat, on which account I never eat of goat's flesh. My father never was afraid of the devil, neither am I. He used to say that the devil was afraid to come near him. One night I saw a black man mounted on a black horse standing in the middle of a bog, and my horse was just following him, as I was dozing in the saddle. Count Dabin and some others were on a good way before, whilst I had lingered a little behind. I called out to the dark man: he made me no answer. My horse was just in the bog, and if I had not been very sharp, I should assuredly have been lost. I dragged him back just in time. The others heard my cries; and the whole of that night—for seven entire hours—we wandered about. The devil often decoys men into marshes with a view to their destruction. My belief is, that this was a judgment on us, because one of our party was a dreadful blasphemer.' Perhaps, looking at the

late hour of the night, and the strange fact of his being asleep upon his horse, it might be possible to offer a simpler but more profane solution of the whole business.

When he was in London, he was greatly astonished at seeing the bridge all stuck over with human heads and quarters as thick as the masts of the ships. He found there twelve excellent libraries. There were some good books among them, he allows, especially historical manuscripts. They had printed a catalogue of these latter; but, as usual, omitted about ten times as much as they printed. He had heard of the Bodleian, and passes judgment on it in this fashion: 'There was a certain knight who presented a famous library to Oxford. It was worth about L.40,000. He must have been a rich man. I say I have looked over the catalogue: they are nearly all ordinary books.' The doctrine as to literary *meum* and *tuum* was very lax in those days; at least, M. du Puy's conduct must be deemed questionable. 'O Pierre du Puy, what a good creature that was! He used to write to me such a store of things I was so anxious to know about. M. du Puy carried off some manuscripts from an abbey in this way; while some kept the door-keeper in conversation, others were lowering the books from a window where there were people waiting to receive them.'

But it is full time to let the ancient scholar depart in peace.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXXVII.—THE WRITING ON THE MAGNET.

THE skill of the trackers was no longer called in need; the war-trail was as easily followed as a toll-road: a blind man could have guided himself along such a well-trodden highway.

Our rate of speed was now ruled by the capacity of our horses. Alas! their power was nearly at an end. They had been two days and a night under the saddle, with but a few hours to refresh themselves by food or rest: they could not hold out much longer.

One by one they began to lag, until the greater number of them followed with tottering step hundreds of yards in the rear.

It was in vain to contend against nature. The men were still willing, though they too were wearied to death; but their horses were quite done up—even whip and spur could force them no further. Only my own matchless steed could have continued the journey. Alone I might have advanced, but that would have been madness. What could I have accomplished alone?

Night was fast coming down: it was already twilight. I saw by the clouded sky we should have no moon. We might follow the trail with our waxen torches—not yet burnt out—but that would no longer be safe. For myself, I was reckless enough to have risked life in any way, but the lives of my comrades were not mine. I could not give them—I should not wastefully fling them away.

Reluctantly I glided from my saddle, gave my steed to the grass, and sat down upon the earth. My followers coming up, said not a word, but picketing their horses, seated themselves around me. One by one they stretched themselves along the sward, and in ten minutes all were asleep.

I alone could not sleep; the fever of unrest was upon me; the demon of thought would not let me close my eyes. Though my orbs ached with the long protracted vigil, I thought that 'not all the drowsy eyrups of the world' could have given repose to my nerves at that moment. I felt as one who suffers under delirium, produced by the intoxicating cup,

the fearful *mania-a-potu*. I could neither sleep nor rest.

I could not even remain seated. I rose to my feet and wandered around, without heed of where I was going. I strode over the recumbent forms of my sleeping companions; I went among the horses; I paced backwards and forwards along the banks of the stream.

There was a stream—a small arroyo or rivulet. It was this that had caused me to halt in that particular spot; for wild as were my thoughts, I had enough of reason left to know that we could not encamp without water. The sight of the arroyo had decided my wavering resolution, and upon its banks, almost mechanically, I had drawn bridle and dismounted.

I once more descended to the bed of the stream, and, raising the water in the palms of my hands, repeatedly applied it to my lips and temples. The cool liquid refreshed me, and seemed to soothe both my nerves and my spirit. After a time, both felt calmer, and I sat down upon the bank, and watched for a while the clear rivulet rippling past over its bed of yellow sand and glistening pebbles of quartz. The water was perfectly diaphanous; and, though the sun was no longer shining, I could see tiny silver-fish, of the genus *hyodon*, sporting themselves in the lowest depths of the pool. How I envied them their innocent gambols, their life of crystal purity and freedom! Here, in this remote prairie-stream, dwelt not the alligator, nor the ravenous garfish; here came no dolphin or shark to chase them, no tyrant of the waters to put them in fear. To be envied, indeed, such an *insouciant*, happy existence!

I watched them for a long while, till I thought that my eyes were growing heavy, and, after all, I might sleep. The murmur of the arroyo helped to increase this inclination to repose, and, perhaps, I might have slept; but at that moment chancing to look around, my eyes fell upon an object that again drove sleep far away, and I was soon as wakeful as ever.

Close to my elbow where I had seated myself grew a large plant of the Mexican aloe (*agave Americana*). It was the wild maguey, of course, but of a species with broad fleshy leaves of dark-green colour, somewhat resembling the maguey of cultivation. I noticed that one of the great blades of the plant was bruised down, and the spine, which had terminated it, torn off. All this would not have drawn my attention: I was already aware that the Indians had made a halt where we were encamped, and their sign was plenteous around—in the tracks of their animals, and the broken branches of trees. One of their horses or mules might have munched at the maguey in passing, and, viewing the bruised blade from a distance, I should have hazarded just such a conjecture. But my eyes were close to the plant, and, to my astonishment, I observed that there was *writing upon the leaf*!

I turned over upon my knees, and seizing the huge blade, bent it down before me, so as to obtain a better view of its surface. I read:

'Captured by Comanches—a war-party—have many captives—women and children—ay de mi! pobres niñas! north-west from this place. Saved from death; alas! I fear!'

The writing ended abruptly. There was no signature, but it needed not that. I had no doubts about who was the writer; in fact, rude as was the chirography—from the materials used—I easily identified the hand. It was Isolina de Vargas who had written.

I saw that she had torn off the terminal spine, and using it as a stylus, had graven those characters upon the epidermis of the plant. Sweet subtle spirit! under any guise I could have recognised its outpourings.

'Saved from death'—thank Heaven for that!—'alas!

I fear.' Oh, what feared she? Was it worse than death? that terrible fate—too terrible to think of?

She had broken off without finishing the sentence. Why had she done so? The sheet was broad—would have held many more words—why had she not written more? Did she dread to tell the cause of her fear? or had she been interrupted by the approach of some of her tyrant captors? O merciful Heaven! save me from thought!

I re-read the words over and over: there was nothing more. I examined the other leaves of the plant—on both sides, concave and convex, I examined them—not a word more could I find: it was all she had written.

CHAPTER LXXVIII.

THE SOUTHERN SAVAGE.

I need not tell how deeply I was affected by the unexpected communication. All at once were decided a variety of doubts; all at once was I made aware of the exact situation.

Isolina still lived—that was no longer doubtful; and the knowledge produced joy. More than this: she was still uninjured—able to think, to act, to write—not only living, but well. The singular 'billet' was proof of all this. Another point—her hands must have been free—her hands at least, else how could she have traced those lines? and with such a pencil? It argued indulgence or tender treatment on the part of her captors.

Another point yet. *She knew I was in pursuit.* She had seen me, then; as I galloped after. It was her cry I had heard as the steed dashed into the chapparal. She had recognised me, and called back. She knew I would still be following; she knew I was following, and for me was the writing meant. Sweet subtle spirit!

Once more I devoured the welcome words; but my heart grew heavy as I pondered over them. What had caused her to break off so abruptly? What was it her intention to have said? Of what was she in fear? It was my conjecture about this that caused the heaviness upon my heart. I gave way to horrid imaginings.

Naturally my thoughts reverted to her captors; naturally I reflected upon the character of the prairie savage—so different from that of the forest Indian, opposite as is the aspect of their homes, and perhaps influenced by this very cause, though there are many others. Climate—contact with Spanish civilisation, so distinct from Saxon—the horse—conquest over white foes—concubinage with white and beautiful women, the daughters of the race of Andalusia: all these have combined to produce in the southern Indian a spiritual existence that more resembles Andalusia than England—more like to Mexico than Boston or New York.

There is not so much difference between Paris and the prairies, between the *habitué* of the Bal Mabille and the horse-Indian of the plains. No cold ascetic this—no romantic savage, alike celebrated for silence and continence—but a true voluptuary, gay of thought and free of tongue, amorous, salacious, immoral. In nine cases out of ten, the young Comanche is a boastful Lothario as any *flâneur* that may be met upon the Boulevards; the old, a lustful sinner—women the idol of both. Women is the constant theme of their conversation, their motive for every act. For them they throw the prairie dice; for them they race their swift mustangs. To win them, they paint in hideous guise; to buy them, they steal horses; to capture them, they go to war!

And yet, with all their wanton love, they are tyrants to the sex. Wife they have none—for it would be sheer sacrilege to apply this noble title to the 'equaw' of a Comanche. Mistress is scarcely a title

term—rather say *slave*. Hers is a hard lot indeed: hers it is to hew the wood and draw the water; to strike the tent and pitch it; to load the horse and pack the dog; to grain the skin and cure the meat; to plant the maize, the melon, squash; to hoe and reap them; to wait obsequious on her lounging lord, anticipate his whim or wish, be true to him, or lose her ears or nose—for such horrid forfeiture is, by Comanche custom, the punishment of conjugal infidelity!

But hard as is the lot of the native wife, harder still is that of the white captive. 'Tis hers to endure all she is enumerated, with still another—the hostility of the squaw herself. The white captive is truly the slave of a slave, the victim of a treble antipathy—of age, of colour, of jealousy. Ofttimes is she beaten, abused, mutilated; and rarely does the apathetic red interfere to protect her from this feminine but deadly persecution.

These were not imaginings; they were not fancies egot in my own brain. Would they had been so! too well did I know they were facts—horrid realities.

Can you wonder that sleep was shaken from my eyelids?—that I could not think of rest or stay, till I had delivered my loved one—my betrothed—from the danger of such a destiny?

All thought of sleep was banished—even weariness forsook me. I felt fresh as if I had slept; my nerves were strung for surprise. It was excitement renewed by what I had read—the impatience of a new and keen apprehension.

I would have mounted and gone forward, spurning rest and sleep; regardless of danger, would I have followed; but what could I do alone?

Ay, and what with my few followers? Ha! I had not thought of this; up to that moment, I had not put this important question, and I had need to reflect upon the answer. What if we should overtake this band of brigands? Booty-laden as they were, and cumbered with captives, surely we could come up with them, by night or by day; but what then? Ay, what then?

There were nine of us, and we were in pursuit of a party of at least one hundred in number!—one hundred braves armed and equipped for battle—the choice warriors of their tribe—flushed with late success, and vengeful against ourselves on account of former defeat. If conquered, we need look for no mercy at their hands; if conquered—how could it be otherwise? Nine against a hundred! How could we conquer?

Up to this moment, I had not thought of the result; I was borne along by only one impulse—the idea of overtaking the steed, and rescuing his rider from her perilous situation. It was only within the hour that her peril had assumed a new phase; only an hour since we had learned that she had escaped from one danger to be brought within the influence of another.

At first had I felt joy, but the feeling was of short existence. I recognised in the new situation a greater evil than that she had outlived. She had been rescued from death to become the victim of dishonour!

CHAPTER LXXIX.

A SUBTERRANEAN FIRE.

In the midst of my meditations, night descended upon the earth. It promised to be a moonless night. A robe of sable clouds formed a sombre lining to the sky, and through this neither moon nor stars were visible.

It grew darker apace, until in the dim light I could scarcely distinguish the forms of my companions—neither men nor horses, though both were near me. The men were still asleep, stretched along the grass in various attitudes, like so many bodies upon a battlefield. The horses were too hungry to sleep—the constant 'crop-crop' told that they were greedily browsing

upon the sward of gramma-grass that, by good-fortune, grew luxuriantly around. This would be the best rest for them, and I was glad to think that this splendid provender would in a few hours recruit their strength. It was the *chondrosium feneum*, the favourite food of horses and cattle, and in its effects upon their condition almost equal to the bean or the oat. I knew it would soon freshen the jaded animals, and make them ready for the road. At least in this there was some consolation.

Notwithstanding the preoccupation of my thoughts, I began to be sensible of a physical discomfort, which, despite their low latitude, is often experienced upon the southern prairies—cold. A chill breeze had set in with the night, which in half an hour became a strong and violent wind, increasing in coldness as in strength.

In that half-hour the thermometer must have fallen at least fifty Fahrenheit degrees; and such a phenomenon is not rare upon the plains of Texas. The wind was the well-known 'norther,' which often kills both men and animals that chance to be exposed to its icy breath.

I have endured the rigour of a Canadian winter—have crossed the frozen lakes—have slept upon a snow-wreath amidst the wild wastes of Rupert's Land; but I cannot remember cold more intensely chilling than that I have suffered in a Texan norther. This extreme does not arise from the absolute depression of the thermometer—which at least is but a poor indicator of either heat or cold—I mean the sensation of either. It is more probably the contrast arising from the sudden change—the exposure—the absence of proper clothing or shelter—the state of the blood—with other like circumstances, that cause both heat and cold to be more sensibly felt.

I had oftentimes experienced the chill blast of the norther, but never more acutely than upon that night. The day had been sweltering hot—the thermometer at noon ranging about the one-hundredth degree, while in the first hour of darkness it could not have been far above the twentieth. Had I judged by my sensations, I should have put it even lower. Certainly it had passed the freezing-point, and sharp sleet and hail were borne upon the wings of the wind.

With nerves deranged from want of rest and sleep—after the hot day's march—after the perspiration produced by long exposure upon the heated surface of the burnt prairie—I perhaps felt the cold more acutely than I should otherwise have done. My blood seemed to stagnate and freeze within my veins.

I was fain to wrap around my body a buffalo-robe, which some careless savage had dropped upon the trail. My followers were not so well furnished; starting as we had done, without any thought of being absent for the night, no preparation had been made for camping out. Only a portion of them chanced to have their blankets strapped upon the cantles of their saddles; these were now the fortunate ones.

The norther had roused all of them from their slumbers—had awaked them as suddenly as a douche of cold water would have done; and one and all were groping about in the darkness—some seeking for their blankets, some for such shelter as was afforded by the lee-side of the bushes. Fortunately there were saddle-blankets, and these were soon dragged from the backs of the horses. The poor brutes themselves suffered equally with their owners; they stood covering under the cold, with their hips to the cutting blast, their limbs drawn close together, and their flanks shaggy and shivering. Some half sheltered themselves behind the bushes, scarce caring to touch the grass at their feet.

It would have been easy enough to make a fire; there was dry wood in plenty near the spot, and of the best kind for burning—the large species of mezquite. Some of the men were for kindling fires at once,

regardless of consequences; but this design was overruled by the more prudent of the party. The trappers were strongly against it. Cold as was the night, and dark, they knew that neither the norther nor the darkness would deter Indians from being abroad. A party might be out upon the prowl; the very buffalo-skin we had picked up might bring a squad of them back; for it was the grand robe of some brave or chief, whose whole life-history was delineated in hieroglyphical painting upon its inner surface. To have made a fire, might have cost us our lives; so alleged the trappers, Rube and Garey. It would be better to endure the cold, than risk our scalps; so counselled they.

But for all that, Rube had no idea of being starved to death: he could kindle a fire, and burn it upon an open prairie, without the least fear of its being seen; and in a few minutes' time he had succeeded in making one that could not have been discovered by the most sharp-sighted Indian in creation. I had watched the operation with some interest.

He first collected a quantity of dead leaves, dry grass, and short sticks of the mezquite-tree—all of which he placed under his saddle-blanket, to prevent the rain and sleet from wetting them. This done, he drew out his bowie-knife, and with the blade 'crowed' a hole into the turf about a foot deep, and ten inches or a foot in diameter. In the bottom of this hole he placed the grass and leaves, having first ignited them by means of his flint, steel, and 'punk' tinder, all of which implements formed part of the contents of Rube's pouch and possible sash—ever present. On the top of the now blazing leaves and grass he placed the dry sticks—first the smaller ones, and then those of larger dimensions—until the hole was filled up to the brim—and over all he laid the piece of turf, originally cut from the surface, and which fitted as neatly as a lid.

His furnace being now finished, the trapper 'hunkered' down close to its edge—in such a position as to embrace the fire between his thighs, and have it nearly under him. He then drew his old blanket over his shoulders, allowing it to droop behind until he had secured it under the salient points of his lank angular hips. In front he passed the blanket over his knees, and both ends reaching the ground, were gripped tightly between his toes. The contrivance was complete; and there sat the old trapper like a handglass over a plant of spring rhubarb, a slight smoke oozing through the apertures of the scant blanket, and curling up around his 'ears' as though he was hatching upon a hotbed. But no fire could be seen, and Rube shivered no longer.

He soon found imitators. The young trapper had already constructed a similar furnace; and the others were soon warming themselves by this simple but ingenious device.

I did not disdain to avail myself of the extra 'shaft' which the kind-hearted Garey had sunk for my accommodation; and having placed myself by its side, and drawn the ample robe over my shoulders, I felt as warm as if seated in front of a sea-coal fire.

Under other circumstances, I might have joined in the merriment produced in my companions by the ludicrous spectacle which we presented—a comic spectacle indeed; nine of us squatted at intervals over the ground, the blue smoke escaping through the interstices of our robes and blankets, and rising around our heads, as though one and all of us were on fire!

Wind, sleet, and darkness continued throughout the whole night—cold wind, sharp icy sleet, and black darkness, that seemed palpable to the touch. Ever so eager, ever so fresh, we could not have advanced along the trail. Grand war-trail as it was, it could not have been traced under that amorphous obscurity, and we had no means of carrying a light, even had this

been safe. We had no lantern, and the norther with one blast would have whisked out a torch of pitch-pine.

We thought no more of going forward, until either the day should break or the wind come to a lull.

At midnight we replenished our subterranean fire, and remained on the ground. Hail, rain, wind, and darkness. My companions rested their heads upon their knees, or nodding slept. No sleep for me—not even the repose of thought. Like some fevered sufferer on his wakeful couch, I counted the hours—the minutes. The minutes seemed hours.

Rain, hail, sleet, and wind seemed, like darkness itself, to belong to the night. As long as night lasted, so long continued they. When it came to an end, all vanished together—the norther had exhausted its strength.

A wild turkey—killed before nightfall—with some steaks of the peccary-pork, furnished us with an ample breakfast. It was hastily cooked, and hastily eaten; and as the first streak of dawn appeared along the horizon, we were in our saddles, and advancing upon the trail.

CHAPTER LXXX.

A RED EPISTLE.

The trail led north-west, as written upon the magney. No doubt Isolina had heard her captors fore-speak their plans. I knew that she herself understood something of the Comanche language. The accomplishment may appear strange, and not strange either, when it is known that her mother could have spoken it well: with her it was a *native tongue*.

But even without this knowledge she might still have learned the designs of the savages—for these southern Comanches are accomplished linguists; many of them can speak the beautiful language of Andalusia! There was a time when a portion of the tribe submitted to the teaching of the mission padres; besides, a few among them might boast—which they do not—of Iberian blood!

No doubt, the captive in their midst had overheard them discussing their projects.

We had ridden about two hours, when we came upon the ground where the Indians had made their night-camp. We approached it warily and with stealth, for we were now travelling with great caution. We had need. Should a single savage, straggling behind, set eyes upon us, we might as well be seen by the whole band. If discovered upon the war-trail, our lives would not be worth much. Some of us might escape; or if all, at least our plan would be completely frustrated.

I say plan, for I had formed one. During the long vigil of the night, my thoughts had not been idle, and a course of action I had traced out, though it was not yet fully developed in my mind. Circumstances might yet alter it, or aid me in its execution.

We approached their night-encampment, then, warily and with stealth. The smoke of its smouldering fires pointed out the place, and warned us from afar. We found it quite deserted—the gaunt wolf and coyote alone occupying the ground, disputing with each other possession of the hide and bones of a horse—the debris of the Indian breakfast.

Had we not known already, the trappers could have told by the sign of the camp to what tribe the Indians belonged. There were still standing the poles of a tent—only one—doubtless the lodge of the head-chief. The poles were temporary ones—saplings cut from the adjacent thicket. They were placed in a circle, and meeting at the top, were tied together with a piece of thong, so that, when covered, the lodge would have exhibited the form of a perfect cone. This we knew was the fashion of the Comanche tent.

'Ef 't hed 'a been Kickapoo,' said Rube, who took the opportunity of displaying his knowledge, 'th'ud 'a bent thur poles in'ard, so's to make a sort o' a roun top, d'ee seep, an ef 't hed 'a been Wacoos or Witcheetos, thu'd 'a left a hole at the top, to let out thur smoke. Delawurs an Shawnee wud 'a hed tents, jest like whites; but thet ur ain't thur way o' makin a fire. In a Shawnee fire, the logs 'ud 'a been laid wi' one eend turned in an the tother turned out, jest like the star on a Texas flag, or the spokes o' a wagon-wheel. Likewise Cherokee an Choctaw wud 'a hed reglar tents, but thur fire wud 'a been alser diff'rint. They'd 'a sot the logs puralell, side by side, an lit 'em only at one eend, an then pushed 'em up as fast as they burn'd. Thet's thur way. 'Ee see these hyur logs is sot diff'rint—thur lit in the middle, an thet's Kimanch for sartint—it ur.'

Rube's knowledge extended further. The savages had been astart as early as ourselves. They had decamped about daylight, and were now exactly two hours ahead of us on the trail. Why were they traveling so rapidly? Not from fear of pursuit by any enemy. The soldiers of Mexico—had these been regarded by them—were too busy with the Saxon foe, and vice versa. They could hardly be expecting us to make an expedition to rob them of their captives. Perhaps they were driving forward to be in time for the great herds of buffalo, that, along with the cold northers, might now be looked for in the northern part of the Comanche range. This was the explanation given by the trappers—most probably the true one.

Under the influence of singular emotions, I rode over the ground. There were other signs besides those of the savage—signs of the plunder with which they were laden—signs of civilisation. There were fragments of broken cups and musical instruments—torn leaves of books—remnants of dresses, silks and velvets—a small satin slipper (the peculiar *chassure* of the Mexican manola) side by side with a worn-out mud-stained moccasin—fit emblems of savage and civilised life.

There was no time for speculating on so curious a confusion. I was looking for signs of her—for traces of my betrothed.

I cast around me inquiring glances. Where was it probable she had passed the night? Where?

Involuntarily my eyes rested upon the naked poles—the tent of the chief. How could it be otherwise? Who among all the captives like her? grandly beautiful to satisfy the eye even of a savage chieftain—grandly, magnificently beautiful, how could she escape his notice? There, in his lodge, shrouded under the brown skins of buffaloes—under hideous devices—in the arms of a painted, keel-bedaubed savage—his arms, brawn and greasy—embraced—oh!—

'Young fellur! I ain't much o' a skollur; but I'd stake a pack o' beaver plew agin a plug o' Jeemes River, thet this hyur manuscrip wur entended for yurself, an nob'dy else. Thur's writin upon it—thet's clur, an mighty kew'rous ink I reck'n thet ur. Oncest or a time I kud 'a read write or print eythur as easy as fallin off a log; for thur wur a Yankee fellur on Duck Crik thet kep a putty consid'able school thur, an the ole 'oman—thet ur Mrs Rawlins—hed this child put thro' a reglar course o' the Testymint. I remembers readin 'bout thet ur cussed niggur as toated the possible sack—Judeas, ef I recollect right, wur the durned raskul's name—ef I kud 'a laid claws on him, I'd 'a raised his har in the shakin o' a goat's tail. Wagh! thet I wud.'

Rube's indignation against the betrayer having reached its climax, brought his speech to a termination.

I had not waited for its finale. The object which he held between his fingers had more interest for me, than either the history of his own early days, or the story of the betrayal. It was a paper—a note actually folded,

and addressed 'Warfield!' He had found it upon the grass, close to where the tent had stood, where it was held in the crotch of a split stick, the other end of which was stuck into the ground.

No wonder the trapper had remarked upon the ink; there was no mistaking the character of that livid red: the writing was in blood!

Hastily unfolding the paper, I read:

'Henri! I am still safe, but in dread of a sad fate—the fate of the poor white captive among these hideous men. Last night I feared it, but the Virgin shielded me. It has not come. Oh! I shall not submit—I shall die by my own hand. A strange chance has hitherto saved me from this horrid outrage. No! it was not chance, but Heaven that interposed. It is thus: Two of my captors claim me—one, the son of the chief—the other, the wretch to whom you granted life and freedom. Would to God it had been otherwise! Of the two, he of white blood is the riler savage—bad, brutal—a very demon. Both took part in the capture of the steed, therefore both claim me as their "property." The claim is not yet adjusted; hence have I been spared. But, alas! I fear my hour is nigh. A council is to be held that will decide to which of these monsters I am to be given. If to either, it is a horrid fate; if to neither, a doom still more horrible. Perchance, you know their custom: I should be common property—the victim of all. Dios de mi alma! Never—never! Death—welcome death!

'Fear not, Henri, lord of my heart! fear not that I shall dishonour your love. No—sacred in my breast, its purity shall be preserved, even at the sacrifice of my life. I shall bathe it with my blood. Ah me! my heart is bleeding now! They come to drag me away. Farewell! farewell!'

Such were the contents of the page—the fly-leaf of a torn missal. Upon the other side was a vignette—a picture of Dolores, the weeping saint of Mexico! Had it been chosen, the emblem could scarcely have been more appropriate.

I thrust the red writing into my bosom; and, without waiting to exchange a word with my companions, pressed forward upon the trail.

CHAPTER LXXXI.

MORE WRITING IN RED.

The men followed as before. We needed no trackers to point out the way; the path was plain as a drover's road—a thousand hoofs had made their mark upon the ground.

We rode at a regular pace, not rapidly. I was in no hurry to come up with the savages; I desired not to get sight of them before nightfall; it would be better not, lest they might also get sight of us.

The plan I proposed to myself for the rescue of my betrothed, could not be accomplished in the daytime; darkness alone could avail me in carrying it out, and for nightfall must I wait.

We could easily have overtaken the savages before night. They were but two short hours in the advance of us, and would be certain—as is their custom on the war-trail—to make a noon-halt of several hours' duration. Even Indian horses require to be rested.

We calculated the rate at which they were travelling—how many miles to the hour. The prairie-men could tell to a furlong, both the gait and the distance.

The tracks of the poor captives were still seen along the trail. This shewed that the party could not have been going faster than a walk.

The prairie-men alleged there were many horses without riders—led or driven; many mules, too—the product of the foray. Why were the poor captives not permitted to ride them?

Was it sheer cruelty, or brutal indifference on the part of their captors? Did the inhuman monsters gloat over the sufferings of these unfortunates, and

deny them even the alleviation of physical pain? The affirmative answer to all these questions was probably the true one, since hardly better—no better, indeed—is the behaviour of these savages towards the women of their own blood and kind—their own squaws.

Talk not to me of the noble savage—of the simplicity and gentleness of that condition falsely termed a 'state of nature.' It is not nature. God meant not man to be a wild Ishmaelite on the face of the earth. Man was made for civilisation—for society; and only under its influence does he assume the form and grace of true nobility. Leave him to himself—to the play of his instincts—to the indulgence of his evil impulses—and man becomes a brute, a beast of prey. Even worse, for wolf and tiger gently consort with their kind, and still more gently with their family: they feel the tenderness of the family tie. Where is the savage upon all the earth who does not usurp dominion, and practise the meanest tyranny over his weaker mate? Where can you find him? Not on the blood-stained karoos of Africa, not upon the forest-plains of the Amazon, not by the icy shores of the Arctic Sea, certainly not upon the prairies of North America.

No man can be noble who would in wrath lay his finger upon weaker woman; talk not, then, of the noble savage!—fancy of poets, myth of romancers!

The tracks of riderless horses, the footsteps of walking women—tender girls and children—upon that long tiresome trail, had for me a cruel significance—those slender tiny tracks of pretty feet—*pobres niñas!*

There was one that fixed my attention more than the rest: every now and then my eyes were upon it; I fancied I could identify it. It was exactly the size, I thought. The perfect symmetry and configuration, the oval curve of the heel, the high instep, the row of small graduated globes made by the impression of the toes, the smooth surface left by the imprint of the delicate epidermis—all these points seemed to characterise the footprint of a lady.

Surely it could not be hers? O surely she would not be toiling along that weary track? Cruel as were the hearts of her captors, brutal as were their natures, surely they would not inflict this unnecessary pain? Beauty like hers should command kinder treatment, should inspire compassion even in the breast of a savage! Alas! I deemed it doubtful.

We rode slowly on, not desirous of overtaking the foe: we were allowing them time to depart from their noon halting-place. We might as well have stopped for a while, but I could not submit to the repose of a halt. Motion, however slow, appeared progress, and in some measure hindered me from dwelling upon thoughts that only produced unnecessary pain.

Notwithstanding the incumbrance of their spoils, the Indians must have been travelling faster than we. They had no fear of foes to retard them; nought to require either spies or caution. They were now in their own country—in the very heart of the Comanche range—and in dread of no enemy. They were moving freely and without fear. We, on the contrary, had to keep our scouts in the advance; every bend of the road had to be reconnoitred by them, every bush examined, every rise of the ground approached with extreme care and watchfulness. These manœuvres occupied time, and we moved slowly enough.

It was after mid-day when we arrived at the noon-camp of the savages. They had kindled fires and cooked flesh. The smoke, as before, warned us, and approaching under cover, we perceived that they were gone. The bones, clean picked, were easily identified, and the mid-day meal shewed that there had been no change in the diet of these hippophagists: dinner and déjeuner had been alike—drawn from the same larder.

Again I searched the ground; but, as before, the eyes of the trapper proved better than mine.

'Hyr's a other billit-dux, young fellur,' said he, handing me the paper.

Another leaf from the missal!

I seized it eagerly—eagerly I devoured its contents! This time they were more brief:

'Once more I open my veins. The council meets to-night. In a few hours it will be decided whose property I am—whose slave—whose— Santissima Maria! I cannot write the word. I shall attempt to escape. They leave my hands free, but my limbs are tightly bound. I have tried to undo my fastenings, but cannot. O, if I but had a knife! I know where one is kept; I may contrive to seize it, but it must be in the last moment—it will not do to fail. Henri, I am firm and resolute; I do not yield to despair. One way or the other, I shall free myself from the hideous embrace of— They come; the villain watches me; I must'—

The writing ended abruptly. Her jailers had suddenly approached. The paper had evidently been concealed from them in haste; it had been crumpled up and flung upon the grass—for so was it when found.

We remained for a while upon the spot, to rest and refresh our horses; the poor brutes needed both. There was water at the place, and that might not be met with again.

The sun was far down when we resumed our march—our last march along the war-trail.

TOADYISM OF GENIUS.

The grand era of literary flattery in England was in the early dawn of our literature; when readers, however courteous and gentle, were few in number, and a patron was the more necessary to an author for whom as yet there existed no public. Thus we find that Spenser, not satisfied with invoking the protection of his royal mistress for his poem, addressed with it a commendatory sonnet to each person of eminence to whom he presented a copy of the work. The *Faerie Queene* is inscribed (1596), both in prose and verse, to 'Elizabeth, by the grace of God Queene of England, Fraunce, and Ireland, and of Virginia, &c.'

O goddesse heavenly bright,

Mirror of grace and majestic divine,

Great ladie of the greatest isle, whose light,
Like Phœbus' lampe, throughout the world doth shine.

To celebrate, without infringing on the claims of this 'goddess,' the praises of her attendant nymphs, was a delicate task, which the poet performed, however, with great adroitness, in his sonnet to 'all the gracious and beautifull ladies in the court.'

The Chian painter, when he was required

To pourtrait Venus in her perfect here;

To make his worke more absolute, desired

Of all the fairest maidens to have the vew:

Much more me needs, to draw the semblant trew

Of beantie's queene, the world's sole wonderment,

To sharp my sence with sundry beauties vew,

And steale from each some part of ornament.

Spenser did not pay his homage to the fair and the great unrewarded: Lord Grey of Wilton, his especial patron, when lord-lieutenant of Ireland, bestowed on the bard the secretaryship to government in that country, and a grant of 3028 acres of land, from the forfeited estates of the Earl of Desmond, near Cork.

The queen, indeed, dealt out her bounties more sparingly. 'There passeth a story,' wrote Dr Thomas Fuller in 1662, 'commonly told and believed, that Spenser presenting his poems to Queen Elizabeth, she, highly affected therewith, commanded the Lord Cecil [Burleigh], her treasurer, to give him an hundred pound; and when the treasurer (a good steward of the queen's money) alleged that sum was too much, "then

give him," quoth the queen, "what is reason?" to which the lord consented, but was so busied, belike, about matters of higher concernment, that Spenser received no reward.*

The poet seems to lay a trembling hand on the lyre, when commending his verse to the grave 'Lord High Treasurer':

To you, right noble lord, whose careful breast
To menage of most grave affaires is bent;
And on whose mightie shoulders most doth reaste
The burdein of this kingdom's government,
As the wide compass of the firmament
On Atlas' mightie shoulders is upstayd;
Unfitt I these ydle rimes present,
The labor of lost time, and wit unstayd.

If poets are accused, not without reason, of giving unduly flattering titles, much allowance may be made for them, in their struggles to obtain some advantage from their productions, through private favour or patronage, in addition to the profits derivable from the liberality of 'the trade'; and it is only just to remark, that even sound divines have shewn no mean dexterity in the supple arts of dedication. A remarkable instance of this occurs in no less a work than Walton's Polyglot Bible. Walton, who was chaplain to Charles I., and a prebendary of St Paul's, having been deprived of his preferments on the outbreak of the Great Rebellion, found leisure, in those troubled times, for the commencement of his literary undertaking, and was encouraged in his task by the approbation of Cromwell. In the preface to the Polyglot, the author acknowledges the favours which he had received 'A Serenissimo D. Protectoris, operis promovendi causa,' &c. On the Restoration, however, Walton not only cancelled the praise which he had bestowed on his late republican patrons, but substituted some pretty sharp invectives against them: hence the distinction, well known to bibliographers, between the 'republican' and the 'loyal' copies of the Polyglot. Charles II. rewarded the loyalty of the author with the bishopric of Chester.

A proof of honest disinterestedness is presented in the refusal of Dryden to inscribe his *Æneid* to William III. It should be remembered that the pecuniary necessities of the bard were great, and that his age was one in which dedications bore golden fruit. Nor is his independence of conduct in this transaction the less vindicated, because 'the hero William' would not have given sixpence for the finest composition of the sort ever penned. Tonson, for ends of his own, exhausted every motive and inducement to persuade Dryden to dedicate his work to William, but in vain. The attempt on the part of the bookseller to dictate to the poet on this point was a manifest case of trespass on the patrimonial domain of authors.

Swift, who prefixed to his *Tale of a Tub* an 'Epistle Dedicatory to his Royal Highness Prince Posterity,' added a second, which might have afforded a profitable hint to Jacob Tonson:

'The Bookseller to the Right Hon. John Lord

LORD—Although the author has written a large one, yet, that being addressed to a prince whom ever likely to have the honour of being known as such, besides, as far as I can observe, not at all id or thought on by any of our present writers; and wholly free from that slavery which book-usually lie under to the caprice of authors; I it a wise piece of presumption to inscribe these to your lordship, and to implore your lordship's cion of them. . . . Your lordship's name on out, in capital letters, will at any time get off one me; neither would I desire any other help to grow a kerman, than a patent for the sole privilege of ating to your lordship. I should now, in right of

a dedicator, give your lordship a list of your own virtues, and at the same time be very unwilling to offend your modesty; but chiefly I should celebrate your liberality towards men of great parts and small fortunes, and give you broad hints that I mean myself. . . .'

It is no wonder that the fever of dedications, which was at its height during the reign of Queen Anne, experienced some abatement under the Hanoverian dynasty, which, at its outset, gave even less encouragement to polite letters and the fine arts than had been shewn by our Dutch ruler. With consummate candour, George II. said: 'I hate boets and bainters.' It is probable that the neat epigram of Dr Johnson on this sovereign was fully justified:

Augustus still survives in Maro's strain,
And Spenser's verse prolongs Eliza's reign;
Great George's praise let tuneful Cibber sing,
For nature formed the poet for the king.

Goldsmith has given, in the *Vicar of Wakefield*, a lively picture of the abuses to which the dedication-system was still subject in his time. 'As I was meditating one day, in a coffee-house, on the fate of my paradoxes [it is young George Primrose who speaks], a little man, happening to enter the room, placed himself in the box before me, and, after some preliminary discourse, finding me to be a scholar, drew out a bundle of proposals, begging me to subscribe to a new edition he was going to give the world of Propertius, with notes. This demand necessarily produced a reply that I had no money; and that concession led him to inquire into the nature of my expectations. Finding that my expectations were just as great as my purse, "I see," said he, "you are unacquainted with the town; I'll teach you a part of it. Look at these proposals; upon these very proposals I have subsisted comfortably for twelve years. The moment a nobleman returns from his travels, a Creolian arrives from Jamaica, or a dowager from her country-seat, I strike for a subscription. I first besiege their hearts with flattery, and then pour in my proposals at the breach. If they subscribe readily the first time, I renew my request for a dedication-fee. If they let me have that, I smite them once more for engraving their coat-of-arms at the top.'"

It is with a good grace that Goldsmith ridicules the devices of parasites and flatterers. Himself above sordid calculations, instead of seeking a patron among the wealthy or noble, he followed the dictates of his affections, by inscribing the work which first gained him distinction to his brother—'a man who, despising fame and fortune, had retired early to happiness and obscurity, on an income of forty pounds a year.'*

A grave rebuke to the toadyism of authors and the vanity of patrons is administered by Johnson in his manly letter to the Earl of Chesterfield:

'Seven years, my lord, have now passed since I waited in your outward rooms, or was repulsed from your door; during which time I have been pushing on my work through difficulties of which it is useless to complain, and have brought it at last to the verge of publication without one act of assistance, one word of encouragement, or one smile of favour. Such treatment I did not expect, for I never had a patron before.

'Is not a patron, my lord, one who looks with unconcern on a man struggling for life in the water, and when he has reached ground, encumbers him with help? The notice which you have been pleased to take of my labours, had it been early, had been kind; but it has been delayed till I am indifferent, and cannot enjoy it; till I am solitary, and cannot impart it; till I am known, and do not want it. I hope it

* Goldsmith's dedication to *The Traveller*.

is no very cynical asperity not to confess obligations where no benefit has been received, or to be unwilling that the public should consider me as owing to a patron that which Providence has enabled me to do for myself.

We must not expect that even in times of 'literature for the million,' the favour of a 'discerning public' will entirely supersede the pursuit of particular patronage. The writer of this article remembers being told by the poet Campbell that he had regretted through life the mistake which,

In the fire of his youthful emotion,

he committed, by dedicating the *Pleasures of Hope* to a mere personal friend, 'who could do him no good.' On the whole, however, it is matter of congratulation that the dedicatory effusions of our own days are, in great measure, shorn of the servility which marked those of past ages; while, on the contrary, the sister-art of puffing by advertisement, in the hands of modern practitioners, has attained a degree of luxuriance eclipsing the efforts in that line of all former generations.

THE MONTH:

SCIENCE AND ARTS.

ONE of the important matters talked about during the past month, was Mr Allan's interview with the Emperor of the French to exhibit an electro-magnetic machine, which, if rumour may be relied on, will do real work, and avoid the defects of machines which have preceded it. Although the result, however, is said to be satisfactory, as we have not yet been made acquainted with particulars, we are unable to describe the merits of the contrivance. Meanwhile, the question has been considered at a meeting of the Civil Engineers, in Mr Robert Hunt's paper 'On the Application of Electro-magnetism as a Motive Power.' It was treated comprehensively, and reasons were given why the attempts hitherto made have failed. Engines acting by a direct pull will not answer, because the iron, under the repeated blows it receives, alters in character, until in time it becomes something like steel, and then retains an amount of permanent magnetism. Hence it was that Jacobi of St Petersburg set himself to find a way of producing an immediate rotatory motion, and constructed an electro-magnetic machine which propelled a boat laden with passengers about three miles an hour on the Neva; but nothing came of it, owing to heavy cost and other difficulties. Mr Hunt explains what these difficulties are; shews how one magnet will counteract the other, and that 'as the speed of the engine increases, there is curiously a corresponding diminution of available mechanical power; a falling off in the *duty* of the engine as the rotations become more rapid.' Moreover, there remains the important consideration, that to produce mechanical force of any kind, there must be a change of form in the matter producing. In the case of electro-magnetism, the zinc employed in the batteries is the element that undergoes the change; and it has been proved by experiment that six grains of carbon in the fuel produce a motive power equal to thirty-two grains of zinc in the battery, and that, under the best possible conditions, an equal result would be secured by the combustion of six pounds of anthracite coal—the most carbonaceous fuel—as by the conversion in the battery of thirty-two pounds of zinc into oxide. Another way of putting the case is, that the thirty-two pounds of zinc burnt in the furnace will develop precisely the same quantity of heat as that which would be obtained from burning six pounds of coal in the same furnace. Whether producing heat during combustion, or electricity during chemical change, the mechanical force obtained is

precisely the same. Hence, cost is greatly in favour of all use of electricity as a motive I devoured its cost that endeavours after real f: engines will occupy the her. The council is one that will not be given up until some solution has been arrived at; and the amateur scientific investigator will be alike benefited by the publication of trustworthy data.

Chief among things talked about are the Art Treasures Exhibition; the great Handel festival which is to be held at the Crystal Palace; the Great Eastern steam-ship which is to be launched next August; and the telegraph cable, of which many miles are twisted every week at Greenwich, for submersion in the Atlantic. With respect to this last, opinions have been expressed that the manufacture of submarine telegraph cables is open to considerable improvement, and that the only way to insure durability, is to have stout iron wires for the core instead of thin copper ones. Such a cable, it is said, could be twisted for L.70 a mile. There is some talk of a new company to carry out the improvement, if such it be, the project being an under-sea line to the Azores, and thence to Halifax. For England, one uniform rate is proposed of a shilling per message. This system is found to answer well in Switzerland, where any ordinary message can be sent to any part of the country for a franc, and we see no reason why it should not answer here. Let the public but once feel assured of promptitude and secrecy, as well as cheapness, and they will not be slow to avail themselves of the advantages of instantaneous communication. Proof exists in the fact, that on the last Saturday of March, while the elections were in progress, 3000 messages were received at the telegraph offices in the Strand and Lombard, and the country offices were busier than ever. Then look at Canada—500,000 messages were flashed along the line passing through Montreal in 1856.

Let us mention, while on the subject of communications, that 478,000,000 letters passed through the Post-office in 1856. The number is astounding; but it is published by the Duke of Argyll, Post-master General, in his Report for last year. It is an increase of 22,000,000 over 1855. In 1839, the number of letters was 76,000,000; and there were certain prophets at that time who foretold that penny-postage would never answer. What do they say now? And last year a sum of more than L.11,000,000 sterling was sent by Post-office orders. With these results before us, we are glad to notice that the name of Rowland Hill appears in the list of the fifteen candidates selected by the council of the Royal Society for admission into that learned corporation. Mr Grove is another; Mr Whitworth another; Professor Piazzi Smyth, Astronomer-Royal for Scotland, another. The total number of candidates this year is forty-two.

The new Reading-room of the British Museum, having been thrown open for a week to everybody, is now resorted to by the habitual readers and students, and by not a few new ones; for the comfort and conveniences of the room are so great, that numbers will now be attracted who wish to gratify curiosity without undergoing the hardships of the old room. One very gratifying fact remains to be noticed: it is, that up to letter G there will henceforth be but one catalogue instead of two; so that a student looking into that one will be sure to find whatever the library contains under the several initials. The *hard* edges of the volumes of the catalogue—and numbers they are!—are shod with iron, to prevent wear and tear.

The president of the Geographical Society, in his anniversary address, pronounced an *éloge* on Dr. Smith, whose name, as our readers will remember, was made

... death, due to the very and adventure, and red but a few months ago. particulars were given of the intimating, is about to be possible, by one last effort, Franklin expedition. Lady Franklyn has purchased the *Fox* screw-yacht, aided by much sympathy, and generous subscriptions; and Captain McClintock is to have the command, we may be sure that all that human skill and endurance can do to reveal the dread secret will be done. May success attend the effort, though it be but to disclose a tale of disaster, privation, and death.

Seeing that we were threatened with the importation of a murrain from Northern Europe, the Royal Agricultural Society, in co-operation with the Agricultural Societies of Scotland and Ireland, have sent Professor Simonds, a competent veterinarian, accompanied by a German *aide-de-langue*, to examine into the nature of the disease on the continent, and gather all possible information respecting it. It is again repeated in communications to the Society, that the only way of preventing potato disease is to plant *whole* tubers. And Professor Way shews how to distinguish between sound and unsound potatoes, even when no difference is perceptible to the eye. Put a slice from each suspected lot into separate portions of new milk, each about a quarter of a pint, which is to be kept warm for three or four hours. The milk containing sound slices remains unaltered, while the rest is curdled.

To some people, a notice of a new star is now scarcely more interesting than a paragraph concerning a big gooseberry; we, however, think it worth while to mention that another little planet, the forty-third, has been discovered by one of the observers at the Radcliffe Observatory, Oxford.—Another interesting astronomical fact is that, within the past few weeks, there has been a reappearance of spots on the sun. It is interesting, because it tends to confirm the theory which associates the phenomena of terrestrial magnetism with solar spots. The phenomena, as we have more than once explained, go through their various manifestations from maximum to minimum in a period of ten years; the sun-spots do the same; and the more spots, the more marked the phenomena. Last year scarcely a spot was observed, and now that spots begin once more to shew themselves, the attention of astronomers has been called to the fact by no less an authority than Sir John Herschel, in order that complete series of observations may be made with a view to test the theory. Considering that meteorological effects, and consequently health and agriculture, may depend on these phenomena, we think them worthy the attention of others as well as scientific observers.—We record an aid appended to the promotion of astronomical science. A munificent lady at Albany, state of New York, has given funds to establish an observatory in that city. To perpetuate her fame, it is named the Dudley Observatory. An addition recently made to its appliances by purchase, is Mr Scheutz's calculating-machine, which, as we noticed when it was exhibited in London three years ago, calculates and stereotypes astronomical tables by the turning of a winch.—Some weak-minded people are again in fear of the earth's collision with a comet, as if Arago had not settled that question long ago.

Mr McDonald, assistant-surgeon to the surveying expedition under Captain Denham, in the Pacific, has sent a description of the so-called 'sea-sawdust' to the Royal Society. Having had several opportunities of examining this curious production, he pronounces it as belonging to the *Oscillatoride*. The specimens were found to consist of minute filaments adhering in little bundles, with globules of air between, which account for the buoyancy. 'Although,' he says, 'their abiding-place is the open ocean, their habit can

scarcely be regarded as very different from that of those species which flourish in damp localities exposed to the atmosphere.'

Another paper, communicated to the Royal Society by Dr Edward Smith, is of especial interest. It is on the quantities of air breathed under different circumstances during certain periods, extending in many instances to twenty-four hours. It is so difficult to breathe normally with any apparatus fixed over the mouth, that former experiments of this kind have rarely been carried on for more than a quarter-hour continuously: hence the value of the results obtained by Dr Smith. He has now ascertained what quantities of air are breathed while lying down—on waking in the morning—on getting up—after breakfast—while walking—before and after dinner, and the other meals—the effect of different kinds of food and liquids—of riding outside or inside an omnibus—on horseback—going up or down stairs—and on the tread-mill. He has made all the experiments on his own person, and with an apparatus so constructed as to insure accuracy. The subject is one fraught with important consequences, and deserving of careful consideration. For the present, we content ourselves with this brief notice; but we hope to return to the subject with full particulars on some future occasion.

Professor Piazzi Smyth has just communicated to the Royal Scottish Society of Arts an account of experiments made during his voyage to Teneriffe, in taking astronomical observations with a telescope at sea. The difficulty, as will be obvious to every one, has always been the rolling and pitching of the ship, whereby observer and instrument are alike rendered unsteady. To overcome it, the professor invented a balanced frame, with free axes of rotation, somewhat on the principle of the gyroscope, which, when the wheel is kept in rapid motion, remains uninfluenced by the most violent movements of the ship. Having demonstrated his theory on a small scale, he had a frame made large enough to carry instrument and observer. It was placed on the deck of the yacht near the stern; sailors were set to work the driving-wheels, and when they got up to eighty revolutions in a second, the professor says: 'I had the satisfaction, for the first time that any one had had, of looking at sea through a telescope steadied by the same mechanical effort as that which preserves the constancy of the earth's axis in space. I soon ascertained that in spite of the egregious rolling of the yacht, which must be partaken of by the observer, but is happily not partaken of by a telescope mounted as ours, there is no difficulty in keeping the eye *en rapport* with the eyepiece. . . . Having brought the horizon of the sea into the field of view, I was delighted to find it remain there absolutely uninfluenced by the rolling and pitching of the yacht; nay, it even remained bisected on the wire sufficiently long for the captain, the first and second mates, and several of the sailors, to look in and bear witness of the fact. They saw this consummation long desired at sea, and they took kindly to the instrument, though it was an innovation on nautical practice.'

The importance of this invention to navigation can hardly be overrated. After long-continued gales, it sometimes happens that the mariner can only ascertain his true position, or check the rate of his chronometers, by observations of the stars, or an eclipse of one of Jupiter's moons. With Professor Smyth's apparatus, the observations can be taken as accurately as on shore. He himself was about to observe an eclipse of one of the Jovian satellites, when the sailors, by working too eagerly, broke the handle of the driving-wheel. We hope to see the subject taken up by the Admiralty, and practically carried out in the navy; and, as was said by the chairman of the meeting at which the paper was read, 'If her Majesty had occasion to take

a voyage in rough weather, she could not have a greater favour conferred upon her than a seat mounted as Professor Smyth had described, unmoved by the agitation of the waves, and in perfect repose amidst the fury of the tempest.'

We call attention to Mr Niven's paper, brought before the same Scottish Society, 'On the Manufacture of Ropes and Paper from the Stem of the Hollyhock.' This plant produces a great quantity of available fibre, which can be broken down and prepared for pulp by any of the usual methods. It grows from eight to ten feet high under ordinary circumstances, and produces numerous stems as it advances in age. An acre of hollyhocks would yield from three to five tons of fibre fit for ropes, or fifteen tons from which paper could be made. And, as Mr Niven states, 'when the crop requires renewal, the roots, which contain a large amount of farina, should be bruised in the manner of making starch from the potato, and the fibre left is at once suited for the fabrication of a quality of paper stronger even than that which can be produced from the stems, the farina being also available either as a substitute for starch or food for animals. It is also known that the hollyhock contains a large amount of colouring matter, which, being little inferior to indigo, might be extracted, and thus the whole plant appropriated to useful purposes.'

The government of New Zealand have set apart a sum of L.4000 to found prizes for inventions by which the hemp and other fibrous plants of that island may be wrought into articles of commerce. The first person who shall by any means or contrivance of his own manufacture 100 tons of merchandise from the *Phormium tenax*, or other native plants, is to have L.2000. To the second, L.1000 will be awarded; and the first five who, under the same condition, produce 25 tons of merchandise, will receive L.150 each.

By a vote of the colonial parliament, the decimal system of money is to be adopted in Canada. A report on the question, as regards England, has just been published by Lord Overstone. At a late meeting of the Geographical Society of Paris, the gold medal was awarded to Dr Livingstone; and a communication was read shewing how to carry on trade from Algeria to Senegal by way of Timbuctoo.

BENEFIT AND SICK CLUBS.

A tract on this subject has been published at Sheffield, by Mr Charles Hamilton, which challenges attention. An important subject it truly is; since the members of such societies, including Odd Fellows, Foresters, Druids, Rechabites, Shepherds, &c., number more than three millions and a half of the population of England, and contribute four millions and a half to their funds, which sometimes amount in the aggregate to upwards of twelve millions sterling. The majority, however, of those apparently flourishing Benefit Societies are at this moment, according to Mr Hamilton, *insolvent*. But that need not hinder them from going on for a term of years yet; although the final crash, supposing no energetic steps be taken to avert it, is inevitable. Between 1795 and 1836—forty-one years—14,375 clubs broke for want of funds; and they were then re-established on the very same system of construction and management! The main cause of the mischief is the unfair and childishly absurd plan of average payments. In insurance-offices, on lives from 25 to 60, the premiums range from about L.2, 2s. to L.7; but in these benefit clubs, where the claims accruing increase with age, just as in the other the man of 25 and the man of 60 pays the same sum. A few of the clubs have corrected this folly; but in most of the other cases where the evil has been observed at all, the only step taken in the way of obviating it is—to refuse to receive members beyond the age of 45! One half the existing clubs are illegal, because their rules and tables have not been prepared by an actuary, although the cost of this is trifling. As for the legal enrolling of the society, that does not now

cost one farthing. *In fact*, cheapness is the error and the danger of most of the clubs, but cheapness combined with wild and dangerous extravagance; because, as they had their origin in convivial and bacchanalian meetings of former times, so in our day the office of the club and the rendezvous of its members is the *public-house*.

THE SONG OF THE MOUNTAIN STREAM.

LIST to the song of the mountain stream,
From its old rocky chamber springing;
Hailing the earliest morning gleam,
With its frolicking—sparkling—singing!
'Oh, tis a glorious thing to bound
Through a world of such wondrous beauty;
The flowers are breathing sweet odours around,
And hark! the old woods with gay music resound:

Pleasure is glancing,

Sunbeams are dancing,

Life is a boon, and enjoyment a duty!'

LIST to the song of the mountain stream,

As its murmurs are gently swelling,

Bounding along with its noontide theme,

Of the glory of labour telling.

'I'll water the land, and cool the breeze,

And set the young grass blades growing;

I'll creep round the roots of the old oak-trees,

And call to the cattle their thirst to appease.

Lambs shall come skipping,

Birds shall stoop sipping;

All shall be glad for my pure limpid flowing.'

LIST to the song of the mountain stream,

As it rolls with its heaving motion,

Calmly reflecting the sun's last beam,

Ere it loses itself in the ocean.

'No more through the beautiful vale I'll wend;

I have finished life's changeful story;

Peacefully—thankfully seeking the end,

Where with the main, my small tribute shall blend,

Mingling—not dying,

Smiling—not sighing,

Singing for ever *His* greatness and glory.' E.F.

'CAPTAIN DODD AT SEA.'

The writer of this article has fallen into a ludicrous mistake in stating that the Mr Weld, who accompanied Captain Dodd, was the present secretary of the Reg. Society—who was not yet born at the time. The Mr Simon Pure was his half-brother, Mr Isaac Weld, now fifty years his senior; the father having been twice married—once when very young, and again in advanced age. Mr Isaac Weld was the author of the well-known *Travels in America*; but the narrative of Captain Dodd's voyage was written by Mr C. R. Weld.

PAUPERS FOR SALE.

We mentioned, a few days since, the custom of receiving bids for keeping the public paupers which prevailed in some parts of New Jersey. We were not then aware that in some parts of New England—that land of sects and Puritans—the same custom prevailed. In Rhode Island and Vermont, the poor of some towns may occasionally be seen at 'the auction-block,' to be struck off to the lowest bidder, who thinks he can either get a little compensating work out of them, or feed them on the refuse of his table, and many times on that which he never thought fit to be brought into his house. It is not a year since some of the papers of Rhode Island and Vermont called attention to some outrageous abuses in this matter. Would it not be well for some of our New-England states to take measures for preventing the sale at auction of some of the mothers of New England?—*New York Tribune* of June 10, 1853. [The system is still kept up.—*European*.]

PICNICS.

This is not a pretty word, by any means, nor, so far as I know, a very expressive one; and yet, what pleasant memories it awakens. As I never can see a herring, with red-nosed driver, and all the paraphernalia of simulated sorrow—sadder to think upon than even that heavy vacant burden within—without my mind reverting at once to the thoughtless merry time when I was school-boy, and managed to be present at a certain Derby, by paying half-a-crown for the privilege of clinging to a funeral plume; as I never smell a herring, fresh or otherwise, but the waving woods of Inverary, and the long blue waters of Loch Fyne, pass before me like a dissolving view, with all their summer prime of youth and pleasure; so, at this word picnic, formed of two ill-assorted monosyllables, I hear the distant murmur of the seas, and the hurry of shadowy rivers, and the trumpets of the bees upon moorlands, and the whisper of autumn woods, with the voices and the laughter of those I love, ringing, year behind year, through all. There are but few touchstones of our poor human hearts which can elicit any past remembrance wholly without pain; but I think this simple word, that is born of pleasure, and nicknamed in drollery, is one: poverty, ill-humour, illness, all things that deform or embitter our existences, are forgotten in the sound. Care, it is said, killed a cat; but I never heard of its having hurt a picnic: otherwise, the salt would not be left behind so often. Mirth—if he travels even in the hamper with the bottles—is sure to be there; love, who is very light and portable, is carried by the ladies; appetite, like charity, never faileth; and digestion—well, digestion sometimes comes to a picnic a little late, in consequence of having been obliged to go back for the dinner-pills.

I have sat at rich men's feasts, which were partaken of in the open air, whereat powdered footmen have waited upon us decorously, and a bishop said grace; when every one had a cushion to sit upon, and a napkin folded upon his plate: but I scarcely call that picnicking. And I have taken my repast—brown bread, and eggs and onions, with a flask of the most ordinary wine—outside Disentis, in the valley of the Grisons, and ate it upon the hillside by myself, because the town, and the inn, and the people all smelt so unbecomingly; but I don't consider that a picnic either. I have been one of a party of three hundred, whose unvaried contributions to the common stock have been divided upon three weeks before the day of meeting, at a lottery, wherein mustard, and bread, and pepper were the prizes; where there were two military bands to march to, under a thousand Chinese lanterns; where

champagne corks went off like platoon-firing; and where it took half an American lake to ice the wine. And I have joined mighty pleasure-companies of the people, where everybody kept his food in his pocket-handkerchief; and having cut it up with clasp-knives, and devoured it, seized everybody else's hands, and ran down grassy hills at speed; but these things, too, I consider foreign to the picnic, which seems, somehow, to signify something snug and well selected, and quite at variance with monster-meetings of any sort.

A picnic should be composed principally of young men and young women; but two or three old male folks may be admitted, if very good-humoured; a few pleasant children; and one—only one, dear old lady: to her let the whole commissariat department be intrusted by the entire assembly beforehand; and give her the utmost powers of a dictatress, for so shall nothing we want be left at home. It is not 'fun' to find one's self without mint-sauce to his cold lamb; nobody, who is properly constituted, enjoys lobster without fresh butter; and when you are fond of salad, it is not cheerful to find the bottle of dressing, which was intrusted to young Master Brown, has broken in his filthy pocket: these things all occur, unless we have our (one) dear old lady. Who else would have seen to that hamper of glass being packed with such consummate judgment? Who else would have brought the plate—I confess I dislike steel forks—in her own private bag? Who else could have so piled tart upon tart without a crack or a cranny for the rich red juice to well through? Who else has the art of preserving Devonshire cream in a can? Observe her little bottle of cayenne-pepper! Mark each individual cruet as it gleams forth from its separate receptacle! Look at the salt-box!—look at the corkscrew! Bless her dear old heart! she has forgotten nothing. However humble the meal, let it be complete; and it can't be complete without its (one) dear old lady.

The girl with the prettiest hands will be generally found—in accordance with the eternal fitness of things—concocting the claret cup; the young man—the one young man, who should have the sole charge of the bottle-department—and who must not be her lover—assisting her. Lemonade and claret is the best mixture for ladies, if you have no 'cup;' and beer, remember, in stone-bottles is almost always flat. Let there be plenty of railway-wrappers to sit and loll upon; for in most of nature's *salles à manger*, and by the sea-coast especially, the seats and couches are hard, and at times damp. I had the mark of a plum-pudding stone—which I was not born with, but which I thought I should carry to my grave—most firmly impressed upon me,

until quite lately, the consequence of an open-air entertainment in the beginning of last autumn. If there is the slightest chance of people being dull, take the last new poem (I have heard better criticism again and again, *sub Jove*, than that of the weekly dispensers of immortality), take a flute—a cornet, if there is an echo—take a sketch-book or two, for they often suggest, and never interrupt conversation; and, if the company be very larkey, and rather unintellectual, take the Racing Game, or a pack of cards. Don't be too polite, for drawing-room manners are out of place at a picnic; but do your very best, either in carving the chicken, or in saying good things, according to your gifts. And, by-the-by, if there is anything forgotten, after all, don't send the most amusing person you've got back for it, because he is the youngest or the poorest; for that, as the mathematicians say, is a great waste of power; but let the stout, rich party go instead, who is as much out of his element among you as an aide-de-camp at church. If you are by the sea-side, be very careful not to break the bottles; for when they are empty and well-corked, they swim in the water capitally, and afford excellent objects for pebble-throwing to both sexes. If there be any servants, drivers, or boatmen, don't forget that they appreciate having the things left for them unhacked and tolerably neat; and if they take your places, don't put everything of value out of sight, as though you were afraid of some condiment. Let the gentlemen withdraw themselves, after dinner, from the weaker vessels who can't stand smoke, and enjoy their cigars; the (one) dear old lady, aided by her obedient and neat-handed Phillis will, during that period, be putting the crockery back again, and the plate into her private bag; and that will be the time, also, you will be remarked upon if you have monopolised the most comfortable place during the meal, or have spoiled a dress through clumsiness, or have been eating rapidly in order to secure two helps of cream.

It is now, when the glory of landscape or of ocean stretches before you, and your every sense is satisfied, that you must feel, if ever, benevolence towards the whole human race, friendship for those present, and love for one (at least) of them; it is the period for affectionate thought and conversation; the time

To glance from theme to theme,
Discuss the books to love or hate,
To touch the changes of the state,
Or thread some deep Socratic dream.

How well the poet, from whom these words are borrowed, has understood this matter, he and his beloved friend, who found the shadows of the wych-els and the towering sycamore so fair after the dust, and din, and steam of town; who, bearing all that weight of learning lightly, like a flower, brought an eye for all he saw, and mixed in all the simple outdoor gambols; who fed both heart and ear of the charmed circle, as they lay and listened to his reading, on the lawn; who loved himself to listen while the maiden flung her ballad to the brightening moon, the while the stream ran on, the wine-flask lying couched in moss, or cooled within its glooming wave; and last, returning from afar, before the crimson-circled star had fallen into her father's grave, and brushing ankle-deep in flowers, they heard behind the woodbine veil the milk that bubbled in the pail, and buzzings of the honeyed hours; they went home—that is to say, to tea, wherein they shewed their wisdom.

My own first recollections of a course of picnics are derived from those, in my boyhood, held at Cliefden Spring, upon the river Thames, near Maidenhead. I was then an Eton boy, and my family living in that vicinity, some half-a-dozen of my schoolfellows, or so, good oars, and most of them good voices, would often row up and spend the day with us at home. Saints'

days were blessed days in those times. Up the fair broad river in a six-oar, with nothing on to speak of, was fine travelling upon an early summer morning; the right royal castle looking down upon us from afar; the flat green meadows upon this side, and the osier-banks on that, and the little wooded islands in the midat, so gallantly stemming the tide. Here we delayed to bathe, and there to beer; here, where the tow-rope took off our straw-hats, to chaff and counter-chaff the bargemen, and there to put our flannel shirts on decently before the ladies met us at the old gray bridge; then, on with our fair burden, through the locks wherein, as the boat sank with the sinking waters, we sang our glees; and again delayed by the wet clinging lilies, which were woven into chaplets—bless the weavers' innocent hearts—for our young brows; and by the swans delayed, which, as we neared their nests among the reeds, flapped out on mighty wings, and hissed their fiercest. So we reached Cliefden Spring, beneath the hanging woods of Cliefden, and by the river's side. What appetites we brought then to those feasts! what merriment! ah me, what youth!

I remember one young after-dinner boaster of us, who, speaking of the great walks thereabouts, observed that they were nothing compared to the extent of those about his place at home. 'There's one, a gravel one,' he said, 'that you may walk ten miles upon and never leave it.' The ladies blushed and smiled. We boys, with swollen cheeks, remarked: 'O yes,' and 'we should rather like to see it'; but one, who was the wisest of us, winked and said: 'Ah, Longbow Major means ten miles *backwards* and *forwards*;' at which we laughed the laugh of those blithe days.

I have picnicked for almost a summer long amongst the Channel Islands; and there are no better places for this pleasantry than there. There is a certain ivy-mantled, wood-surrounded tower in Jersey, from which almost the entire island, the whole great strata—which coins its own half-pennies—can be surveyed. The tiny roads that thread it in and out, shut in by honeysuckle hedges; the avenues that lead to the old seigneuries; the small green valleys, where the beautiful cattle feed; the mighty ruined castle by the sea: you may sit and see it all from the tower, smoking your great penny cigar, after your good bottle of claret at 1s. 9d., after your peerless Jersey lobsters, your unexcelled green figs, your peach unrivalled, and your sanspareil pear. Or will you prefer Grève au l'Anchou (of sand-eels), where the white sand sparkles for such a distance eastward, and the forsaken pools are like mirrors; where the mighty caverns will shelter you from the sun, and the spring-water leaps from the rock to mix with that brandy which is so cheap, and not British? Or, again, will you choose the tremendous headland, Groenez, that juts out nose-like into the ocean, almost close under which the low coast of France seems to smile invitingly, whither those exiles yonder are straining their eager eyes? We have dined in these fair spots as merrily as anywhere, and amongst pleasant Jersey faces, as kindly as any in broad Britain. Ah! happy island-days! our canopy, the sky without a cloud; our banquet-hall, the cliffs above the sunlit sea!

Lastly, omitting many a forest-meal, and many a spread upon the ruined ramparts of the Dane and Roman, in shells of ancient castles and upon decks of yachts at sea, let me recall one picnic more. From where I sit and write—between the oaks and across the little harbour with its angry bar—I see the very place where we, we thirteen, dined; upon the beach yonder in the fifth cove of the red cliff-bound bay. You cannot pass to it by land save at mid-tide and after, because of these four headlands which reach so far into the sea. Starting at half ebb, therefore, we took boat and sailed thither, determining to

walk home round the points. The sandy bay we had chosen for debarkation was so flat that the boat could not come in, and we chivalrous men had to get out and drag it and the ladies high and dry. There was a mighty archway, cut by that laborious handicraftsman Ocean, through which the beautiful village we had lately left, the wooded cliffs beyond it, and the channel-stream with white-sailed ships, were seen as in a picture; in the foreground, too, was a mighty fallen fragment, resembling, almost minutely, that statue, brave and pitiful, of the Dying Gladiator—nature, as it really seemed, playing the painter and the sculptor, and putting both arts to shame. The sketch-books were produced of course, at once, and it was decided here to dine. There was a doubt amongst the superstitious whether we should not ask the old boatman to make us up fourteen; but finally, he was paid and sent away. 'Be sure, gents,' were his last words, 'not to start later than four o'clock; and even then you'll get your feet wet round the last point, perhaps.' And the 'gents,' thinking he only wanted to frighten them, and get another job, replied: 'O yes, bother the time!' as though ten minutes' unpunctuality in the matter would not have been our death-doom, with the spring-tide rising thirty feet, and we shut out from life by a sheer wall of cliff which rose five hundred. We laughed and talked, drew and painted, climbed rocks, explored caverns, and dined; the time flying on at average picnic speed, and even quicker. There wanted but a quarter to the fatal hour, and there was not a thing packed up; the most philosophic of our party, too, had only just lit his second cigar, over which he was accustomed to form his judgment upon all things, and we did not dare disturb him. It was five minutes past the hour when we all started, slow and hamper-laden, for home. By skipping round the first point from stone to stone, we managed to clear it dry shod, but the tide was coming in apace, we saw, and I heard somebody say, in a hollow voice, that something would come of our having been thirteen at dinner. Round the next we had to wade knee-deep, and carry the ladies pick-a-back. We ran on over the intervening sand at full speed, and quite silently, for we knew our case was getting very hazardous, and found at the third point the water was up to our waists. There was but one promontory more, and that once rounded, we knew that we should be in safety. We must effect that passage, for, as we were well aware, we were cut off by the remorseless waves from all retreat—even to that strip of beach where we had dined, and where, indeed, the surrounding rocks were just as precipitous as elsewhere. We found the tide at the last point six feet in, at least, and quite unfordable. A look of unutterable horror stole over every face; the philosopher dropped his hamper of crockery with a tremendous crash upon the shingle. 'It's no use my bothering myself with that any further, at all events.' No statement, however solemn, not even 'this all comes of our having been thirteen at dinner,' which here again tolled forth, could have had a more awful effect upon us than this, for we knew that he had had his second cigar, and that his judgment was perfected. There was a little rock some twelve feet in the sea, which would not be covered over for an hour perhaps, and thither, with mournful hearts, we waded, to eke our lives out by that scanty space. I, too, had a good mind to let that heavy young person whom I had hitherto supported on my shoulders get there unassisted, as she was only going to be kept dry for so short a time: it was very lucky that my good-nature prevailed, for behind the rock lay our good old boatman in his wherry, concealed and laughing to himself. 'Ah, I thought you'd get your feet wet round the point, gents, so I just waited here, in case you might want me.' The heavy young person threw her arms about him there and then, and kissed him; and for my part, I shall not forget him either, nor that

spring-tide autumn picnic, although the mark of the plum-pudding stone has, as I have said, by this time paled away.

PAST AND PRESENT OF INDIA.

So far as our eastern territories are concerned, we may well exclaim: *Tempora mutantur, nos et mutamur in illis*. The type of the old-school nabob has almost completely disappeared from our comedies and romances; there are few families without some friend or relative in India, and from him they discover that every individual who has sojourned in that country for any length of time, is not invariably an eccentric old bachelor, imperious in manner and munificent in ideas, with a yellow face, a liverless body, and pockets full of gold. Except a tinge of bronze in the complexion, and an unusual consumption of pale ale and cayenne, there is little to distinguish the East Indian of the present day from his brother who lives at home at ease. The cheap rate of postal charges for forwarding books and periodicals, has enabled him to keep himself acquainted with the current topics of the day; the shortness of the overland route, compared with the old circuitous voyage, brings him home to re-Europeanise himself before he has become confirmed in the habits and tastes which the climate and custom of the country induce.

We generally find the conquerors of any country adopting many of the customs of the original inhabitants, whom they affect to despise and dislike. In this way the Mohammedans of Hindostan have fallen into many Hindoo prejudices, particularly in matters of eating and purification; for which they are stigmatised as latitudinarians and heretics by their orthodox brethren of El Hejaz. In former days, the unhappy individual who went into voluntary exile in India, finding himself deprived of European society, and without books or intellectual occupation of any kind, gradually subsided into native habits and amusements. Few had strength of mind to resist the opportunities afforded them of amassing a large fortune by the most corrupt practices. Commanding officers drew the pay of a number of paper-men, as they were termed, who existed only on their own muster-rolls; promotion was sold to the highest bidder, and the lawsuit decided in favour of whoever gave the largest bribe. It will readily be believed that such a state of things caused a low standard of morality; but it can hardly be credited that any one born of Christian parents, in a Christian land, could so far forget his country and his God, as to conform to the degrading practices and tenets of paganism. Nevertheless, on the top of a hill near Saugur cantonment, may still be seen the remains of a temple, built by a late field-officer of the Bengal army, known by the name of 'Hindoo Stewart,' and endowed by him with a sufficient sum to maintain the officiating Brahmins. He dressed completely in native fashion, even to his hair, which he allowed to grow long, and turned up behind with a comb; he never ate any kind of animal food, nor would he touch his ordinary diet unless assured that it had been prepared by a person of good caste; he daily went to the ghaut, and performed the ablutions and devotions enjoined in the institutes of Menu, the great Gentoo authority in matters of faith. Thus he lived, and thus he died; and those natives who had courted and flattered him for the sake of what they could extract from his purse, shewed their contempt for

the memory of the renegade by destroying after his death anything that might serve to perpetuate it, even though it were a temple constructed for their own impure worship.

Since that time, the order of things is reversed; instead of the European lowering himself to the level of the native, the latter endeavours to raise himself in the social scale by adopting civilised habits and conforming to European ideas. Many of the higher classes dress and entertain in the English fashion. When they ask you to their house, everything at table is cooked and served in French style; and though they will not eat with you, they will ask you to take wine, filling their own glass with water. Natives of all classes take their passage in the fire-boat, or their ticket in the *smoke-drag*,* without being considered guilty of impiety in committing themselves to that machine worked by magic, and made by evil spirits. A screw-steamer is even still rather a severe trial of their feelings, the motive-power being invisible. However, as this kind of vessel is not found suited to river-navigation, their fortitude is seldom put to the test in that way. Natives avail themselves largely of the electric telegraph; suttee and female infanticide are nearly abolished; education is making great strides—there are commissioners of education, boards of education, colleges and schools scattered all over the country.

The tawny students in these aspiring institutions can recite Milton and spout Shakspeare, though they know not the difference between latitude and longitude, and cross the *pons asinorum* before treading the beaten path of common addition and vulgar fractions. Probably *Paradise Lost* and geometry will never be of more practical use to them than Mrs Jellaby's warm flannel-vests and moral pocket-handkerchiefs were to the young niggers of Borriboolagha; nevertheless, the memory is exercised, the mind enlarged, some information communicated, and means furnished for obtaining more, through a knowledge of the English language, as the native literature is very limited, and the little there is, anything but instructive or improving. Such progress has been made in this respect, that a native gentleman at either of the three presidencies would consider it an insult to be addressed in his native language, of which he makes no more use in polite society than the Poles and Irish do of theirs.

England has been making a steady and gradual advance since the days of our great-grandfathers; but though her national debt has increased enormously, neither her standing army nor territories have increased in proportion, for while she has gained in the east, she has lost in the west. What is her progress compared with that of India? Exactly one hundred years have elapsed since the tragedy of the Black Hole of Calcutta was enacted, when, of the handful of Europeans who represented Great Britain in the now flourishing City of Palaces, 123 perished miserably in a single night. Though not a vestige now remains of the old fort which they held for three days against 70,000 native troops, or of the dungeon where they were foully murdered—even the obelisk erected to their memory has disappeared—still the tale of their gallantry and sufferings is familiar to all, and has even passed into a proverb.

At that time (1756), the Company of merchants trading to the East Indies did not hold the anomalous position which the merchant-princes of Leadenhall Street now do; they were simply a mercantile community holding a monopoly of all trade to the eastward of the Cape, and having for this purpose some seven or eight stations on the eastern and western coasts of

India. Small forts were built for the protection of each factory, and a grant of land attached to it, possession of which was not always obtained in the most honest or straightforward manner. Territory there was none; the whole of the Company's possessions put together would not make a single zillah or district of the present day. Their minds being chiefly bent on amassing wealth, they had neither the will nor the power to commit acts of aggression, but retained, for the defence of their factories, a limited number of mercenary soldiers, chiefly composed of European adventurers and low-caste natives. There was no standing army, for only two regiments in the Company's service claim to be a century old, and even these are doubtful.

At the present time, the Company's territories extend, with little interruption, over 27 degrees of latitude and 29 degrees of longitude, covering an area of nearly one million square miles. The additions made within the last ten years alone contain forty millions of inhabitants—an amount considerably exceeding the entire population of Great Britain, Ireland, and the Channel Islands.

Besides 4 cavalry and 22 infantry regiments of Her Majesty serving on the Indian establishment, which are paid by the Company, their standing army at present consists of 5 brigades horse-artillery, 18 battalions foot-artillery, 3 corps of engineers, and 3 of sappers and miners, 21 regiments light cavalry, 9 regiments European infantry, 155 native infantry regiments, 23 regiments irregular cavalry; besides which, there are about 15 cavalry and 67 infantry local and irregular regiments.

Four thousand miles of electric telegraph, and 250 miles of railway, are daily at work in Hindostan, whilst large extensions of both are in progress. The former, after extending its arms all over India, will soon reach Point de Galle, the south-western extremity of Ceylon.

Five companies have been formed under government guarantees for the construction, on a gigantic scale, of railways in India; in all of which the shares are at a premium, and the works progressing more rapidly and cheaply than even the projectors anticipated. One of these will run a line above 1100 miles long, intersecting the entire peninsula, and connecting Bombay with Calcutta. This will accelerate, by more than a week, the arrival of the mail at the latter place, and shorten the journey to England some 1500 miles; besides which, it will open a line of country abounding in minerals, and particularly coal—the scarcity of which is the greatest drawback at present—and possessing a rich soil, beautiful scenery, and a climate equal to or superior to that of any part of the plains of India; but all these advantages have been hitherto unavailable from the want of easy communication by land or water, and that part of the country is little known to or visited by Europeans.

Steamers now ply frequently and regularly on the principal navigable rivers, which, though far inferior in speed and light draught to those used on the American rivers, are a great improvement on the kind of craft which used to ply there previous to their introduction—worse built, worse found, or worse manned craft than the old-country boats and budgerows never floated since the *Argo* was launched. The latter was the more comfortable, but the former the faster of the two, or, more properly speaking, the less slow.

The country boats were often of large size, but modelled and put together in the rudest manner; they were not only flat-bottomed but flat-bowed also, the under part of the stem being like the toe of a Chinese slipper, by which means the greatest possible resistance and the least buoyancy were obtained. Being so constructed, in order to make them fit for European use, a platform of bamboos was constructed, nearly on a level with the gunwale, and occupying all the after-part of the boat. On this was erected with grass, bamboo,

* Anglicè, locomotive.—To those curious in railway statistics, the returns of Indian railways furnish interesting facts, particularly the immense disproportion of first, second, and third class passengers. The East India Railway gives the following return for six months, ending 30th June 1856: first class, 6406; second class, 23,256; third class, 402,599!

and matting, a temporary house, high enough to stand upright in the middle only, which afforded tolerable protection from the sun, but gave free access to rain, wind, and sand—the last, when it blows fresh, being often the greatest nuisance of the three.

On the upward voyage, these boats were slowly and painfully tracked against the stream, at the average rate of ten or twelve miles a day. Whenever the formation of the river rendered a crossing necessary, this was so clumsily effected, that what had taken hours of labour to attain was often lost in a few minutes. On the downward voyage, they were paddled along in the deepest part of the river, in selecting which the manjies usually shewed great discrimination, and seldom bumped ashore more than twenty or thirty times a day. The paddling, too, was more for appearance's sake than anything else, as it seldom was energetic enough to give her steerage-way; consequently, she swung round with every eddy, and more than half the voyage was performed broadside on or stern-foremost. This kind of craft cannot do much in the sailing line, as there is seldom a fair wind, and when there is, it does not much assist their progress, as the rectangular sail is cut and set with a total disregard to nautical science; and one without a plurality of rents and apertures is a very unusual sight. Besides this, they cannot sail at all unless the wind is dead aft; and even then, before you have advanced very far, a bend of the river is sure to bring it abeam, and the unweatherly craft, having no more grip of the water than a washing-tub, goes bodily away to leeward like a floating haystack, and is soon brought up all standing in the sand-bank. Some of the crew get out into the water, whilst others shove with long bamboos until you get off, only to repeat the same process a few yards further ahead. If the reach be a short one, it is passed in this way with the expenditure of some time, much bad language, and perhaps damage to your crockery and movables; but if it be a long one, the crew soon get tired, and the manjies say: 'The line of fate cannot be obliterated: my brothers, let us smoke.' So acceptable a proposal is at once agreed to, and down they all squat on the shore, bubble-bubble in hand, whilst the boat thumps and grinds unceasingly against the bank. Probably, like yourself, it chafes with the aggravating consciousness that could she only get past the point just ahead, she would have a fair wind for the rest of the day.

Gales of wind sometimes occur, and numbers of these boats are destroyed—either sunk in deep water, broken against the shore, or crushed by the high banks falling on them; and even if the voyage be safely accomplished, it is intolerably slow and tedious—the writer having taken three months in a sixteen-oared budgerow to accomplish a distance which he afterwards performed in three weeks in a steamer towing a large flat, deeply laden with cargo.

In the postal department, too, there is great improvement. India has her postage-stamps and her mail-carts; and the letter which would have cost a rupee, can now be delivered quicker and surer for an anna—this reduction being from two shillings to about three half-pence.

The great trunk-road from Calcutta to the upper provinces was well made and kept; and as far as this went, the mails travelled very fairly; but the roads diverging from this were bad—in many instances, mere tracks through the jungle, without drainage or bridges, and consequently unfit at all times for wheeled carriages, and totally impassable during the rains. The traveller through those regions might observe wherever a deep nullah crossed the road, a stout pole placed on either bank, with a rope suspended between. This was used for conveying the mail-bags over by sliding them across to a man stationed on the other bank, whenever a sudden rising

of the nullah rendered it impassable. These ropes remained exposed to the weather all the year round, and were not replaced until they rotted away of themselves, and consequently were not much to be depended on. Like a faithless friend, they often failed when their aid was most needed; and the mail-bag, with its miscellaneous contents, was consigned to eternal oblivion in the raging torrent.

One of these catastrophes was duly chronicled by our Dak Baboo in the following words: 'Mail not come, having been drowned in a nullah.' This Dak Baboo, an individual of portly presence and phlegmatic temperament, was really post-master of the out-station where we were then quartered, as the subaltern who ostensibly discharged the duties gave himself little trouble about them except that, being of an inquiring turn of mind, he liked to make himself acquainted with the nature and extent of his neighbours' correspondence. All the real business was transacted by the Baboo, whose method might be gathered from his reply to our query—'At what hour does the post go out?'—'Generally about sunset, if the Burra Sahib's letters are ready.' A letter from Calcutta cost us then fourteen annas (1s. 9d.), and nominally took eleven days for its transit of 800 miles; but it seldom reached us so soon. Whenever it did arrive dry and clean in the allotted period, we paid our exorbitant postage with thankful hearts, and felt as if we never could be sufficiently grateful. When, on the contrary, we were several days without receiving any mail, and when the stale letter did reach us, partly reduced by moisture and friction to a muddy pulp, we neither grumbled nor stormed, but philosophically looked upon it as the natural and inevitable state of affairs.

In those days, the mails were everywhere carried by men improperly called *Dak-runners*—'*parce quia minime parant*'—because they never ran except when entering or leaving a station, on the post-boy principle of keeping a gallop for the avenue. They carried the post-bags on their backs, or suspended from a stick over the shoulder, and were fondly supposed by credulous individuals to accomplish four and a half miles per hour, which in truth they seldom did.

Their task was not very arduous, as each runner was relieved every ten or twelve miles; but as the stations were generally long distances apart, and no such thing as a watch or clock to be found on all the intervening space of road, it was almost impossible to ascertain which of the reliefs had caused the delay, so that the loiterer might be fined. The runners knew this, and presumed on the strength of it, suiting their pace exactly to their inclinations. Many stories are told of their lazy and dilatory habits; but there is one which I suppose must be true, as I have heard at least a dozen different persons tell it, the relater being invariably the hero of his own tale.

It would appear that the narrator had been on the march in some remote district, when one morning, just before daybreak, he spied a man stretched by the road-side, apparently fast asleep. Surprised at seeing any one in this position in so wild a spot, he dismounted and approached him, when he perceived that the unconscious individual was a *dak-runner*, who lay calmly slumbering in the moonlight, 'with the dew on his brow and the rust on his mail,' and the letter-bags converted into a temporary pillow. A vigorous application of the foot, and a shout of 'What are you doing here?' soon roused the sleeper, who started up, and rubbing his eyes with one hand, and his person with the other, exclaimed: '*Hum express hy*' (I'm the express). Yes, this was the swift-footed Mercury who had been intrusted with the conveyance of the express despatched from Bombay on the arrival of the overland mail, and received extra pay for going quicker than the ordinary mail-carriers.

With such messengers as these, it was not very surprising that we were often behindhand with our mails; but late though it might be when they arrived, there was no indecent haste in their delivery. Before opening the bags, they had to be taken to the post-master aforesaid, in order that he might satisfy himself regarding their contents; they were then returned to the post-office, where, as the peon who acted as letter-carrier could neither read nor understand the English characters, it was necessary to inscribe them with certain Dewanagari hieroglyphics, purporting to be the name and address of the intended recipient. In spelling this, the phonetic method was pursued; and the Hindostanee way of pronouncing a proper name being very dissimilar from the English, the result was a cognomen so original as to make us wonder that the letter ever reached its right destination.

The natives display singular ingenuity in disguising European names, so that the owner could not possibly recognise them, unless acquainted with its Hindoo synonyms; but the most curious part of it is, that however remote from the original this synonym may be, it is invariably the same in all parts of India. Even our old friends Smith and Brown lose their familiar appellation, and become Ismit and Boorun; Captain Cartright is always styled Captain Cockrile; and Mr Ballingall, Bunghole Sahib. Sometimes even a wider range is taken, and the initial letter only retained: thus Gilpin is substituted for Griffiths; and occasionally, when the original syllables are adhered to, their order is inverted; Sir David Ochterlony, for instance, being invariably spoken of as Lonyochter Sahib.

But somehow or other, the letters generally did, in process of time, reach their destination, unless the confiding writer had paid the postage, and not taken a receipt from the Dak Baboo, in which case their fate was generally involved in mystery. Parcels, too, were transmitted through the post-office—by Dak Banghy, as it was termed—at a high rate, in proportion to their weight. Great dexterity was exhibited in tampering with these, the contents, if valuable, being frequently abstracted, and their place supplied with some substance of equal gravity, though rather less intrinsic value, such as a stone or lump of earth. Watches often disappeared in this manner when sent to Calcutta for the purpose of being repaired, there not being any one in the upper provinces capable of doing so. An ingenious acquaintance, in order to frustrate the rogues, hit upon the device of getting an old book, cutting a circular piece out of the centre, and depositing the watch therein. As the Dak wallahs were not men of literary tastes, the parcel went and came in safety, trusting to which another friend had recourse to the same expedient for transmitting his watch also. Whether the jeweller's address on the parcel betrayed the nature of its contents, or the weight of the pseudo volume told its own tale to the Dak Baboo, who had no experience of how heavy certain emanations from Paternoster Row are, must ever remain a mystery; but certain it is that when the parcel arrived at Calcutta, apparently uninjured, it was found, on opening it, that the place where the watch had been was occupied by a piece of lead!

We have thus taken a retrospective glance at what India was a century ago, and also a cursory view of her intermediate stage and present position; but who can speculate on what she may become ere a similar period has elapsed: when the march of intellect and diffusion of knowledge shall have prepared the way for the introduction of Christianity, the only sure basis of civilisation—when her vast mineral and vegetable resources shall have been developed—when the Suez Canal and Euphrates Valley Railway shall be accomplished facts—when the electric telegraph, *via* Constantinople, Bassorah, the Persian Gulf, and Kurrachee,

shall have brought Calcutta within speaking distance of Cockaigne!

The ungenial climate must ever be a bar to European colonisation; but sad experience has taught us how to avoid the most unhealthy spots; and greater attention to drainage, clearing, and ventilation will do much to prevent malaria and diminish disease; besides which, increased facilities of communication will place the cool hill-station and refreshing sea-breeze within reach of all, and enable the incipient invalid *venienti occurrere morbo*. With all this, despite of extended territory and increased wealth, we may delicately hint to our readers that the Honourable East India Company is in a state of genteel insolvency. There is an annual deficit of some 2,000,000 in the revenue; nevertheless, they seem to thrive amazingly and live well on the loss. Long may they continue to do so, for if ever the charter be taken from them, and the power now vested in the Court of Directors and Board of Control be taken away, those who now serve and abuse will regret, when too late, the change of masters.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXXXII.

AN 'INJUN ON THE BACK-TRACK'

We had advanced about a mile further, when our scouts—who, as usual, had gone forward to reconnoitre—having ascended a swell of the prairie, were observed crouching behind some bushes that grew upon its crest. We all drew bridle to await the result of their reconnaissance. The peculiar attitude in which they had placed themselves, and the apparent earnestness with which they glanced over the bushes, led us to believe that some object was before their eyes of more than common interest.

So it proved. We had scarcely halted, when they were seen to retire suddenly from the cover, and rising erect, run at full speed back down the hill—at the same time making signals to us to conceal ourselves.

Fortunately, there was timber near, and in a few seconds we had all ridden into it, taking the horses of the trappers along with us.

The declivity of the hill enabled the scouts to run with swiftness; and they were among the trees almost as soon as we.

'What is it?' inquired several in a breath.

'Injun on the back-track,' replied the panting trappers.

'Indians!—how many of them?' naturally asked one of the rangers.

'Who said Injuns? I sayed a Injun,' sharply retorted Rube. 'Durn yur palaver! thur's no time for jaw-waggin. Git yur rope ready, Bill. 'Ee durned greenhorns! keep down yur guns—shootin won't do hyur—yud hev the hul gang back in the flappin o' a beaver's tail. Let Bill rope the nigger, an the young fellur hyur—he knows how; an ef both shed miss 'im, I ain't agwine. 'Ee hear me, fellurs! Don't ne'er a one o' ye fire: ef a gun ur wanted, Targuts 'll be surfficient, I guess. For yur lives don't a fire them ur blunderboxes o' yours till I miss—they'd be heerd ten mile off. Ready w' yur rope, Billees? You, young fellur? All right; mind yur eyes both, an snare the durned nigger the

a swamp-rabbit. Yanner he comes, by the jumpin' Geehosophat!'

The pithy chapter of instructions above detailed was delivered in far less time than it may take to read it. The speaker never paused till he had uttered the final emphatic expression, which was one of his favourite phrases of embellishment.

At the same instant I saw, just appearing above the crest of the ridge, the head and shoulders of a savage. In a few seconds more, the body rose in sight, and then the thighs and legs, with a large piebald mustang between them. I need scarcely add that the horse was going at a gallop; it is a rare sight when a horse-Indian rides any other gait.

There was only one. The scouts were sure of this. Beyond the swell stretched an open prairie, and if the Indian had had companions or followers, they would have been seen. He was alone.

What had brought him back on the trail? Was he upon the scout? No; he was riding without thought, and without precaution. A scout would have acted otherwise. He might have been a messenger; but whither bound? Surely the Indians had left no party in our rear?

Quickly these inquiries passed among us, from mouth to mouth, and quick conjectures were offered in answer. The voyageur gave the most probable solution.

'Pe gar! he go back for ze sheel.'

'Shield! what shield?'

'Ah, you no see 'im. I see 'im wiz me eyes; he vas caché dans les herbes—von larz sheel—bouclier très gros—fabriqué from ze peau of de buffle—ze parfiéché—et garnie avec les scalps—frais et sanglants—scalps Mexicaines. Mon Dieu!'

The explanation was understood. Le Blanc had observed a shield among the bushes where we had halted—like enough left behind by some of the braves. It was garnished with scalps, fresh Mexican scalps—like enough. The Indian had forgotten both his armour and his trophies; he was on his way to recover them—like enough.

There was no time either for further talk or conjecture: the red horseman had reached the bottom of the hill; in ten seconds more, he would be lazoed or shot.

Garey and I placed ourselves on opposite sides of the path, both with our lazoes coiled and ready. The trapper was an adept in the use of this singular weapon, and I too understood something of its management. The trees were in our way, and would have prevented the proper winding of it; but it was our intention to spur clear of the timber the moment the Indian came within range, and 'rope' him on the run.

Rube crouched behind Garey, rifle in hand, and the rangers were also ready, in case both the lazoes and Rube's rifle should miss.

It would not do to let the Indian either go on or go back; in either case he would report us. Should he pass the spot where we were, he would observe our tracks in a minute's time, even amidst the thousands of others, and would be certain to return by another route. Should he escape from us, and gallop back, still worse. He must not be permitted either to go on or go back; he must be captured or killed!

For my part, I desired that the former should be his destiny. I had no feeling of revenge to gratify by taking the life of this red man; and had his capture not been absolutely necessary to our own safety, I should willingly have let him come and go as he listed.

Some of my comrades were actuated by very different motives. Killing a Comanche Indian was, in their creed, no greater crime than killing a wolf, a panther, or a grizzly bear; and it was not from any motives of mercy that the trapper had cautioned

the others to hold their fire; prudence alone dictated the advice—the reports of the guns might be heard.

Through the leaves, I looked upon the savage as he advanced. A fine-looking fellow he was—no doubt one of the first warriors of his tribe. What his face was I could not see, for the war-paint disfigured it with a hideous mask; but his body was large, his chest broad and full, his limbs symmetrical, and well turned to the very toes. He sat his horse like a centaur.

I had no opportunity for prolonged observation. Without hesitating, the Indian galloped up.

I sprang my horse clear of the timber. I wound the lazo around my head, and hurled it towards the savage; I saw the noose settling over his shoulders, even down to his hips.

I spurred in the opposite direction; I felt the quick jerk, and the taut rope told me I had secured the victim.

I turned in my saddle, and glanced back; I saw the rope of Garey around the neck of the Indian's mustang, tightened, and holding him fast. Horse and horseman—both were ours!

CHAPTER LXXXIII.

MY PLAN.

The savage did not yield himself up without resistance. Resistance with an Indian is instinctive, as with a wild animal. He flung himself from his horse, and drawing his knife, with a single cut severed the thong that bound him.

In another instant, he would have been off among the bushes; but before he could move from the spot, half-a-dozen strong arms were around him; and in spite of his struggles, and the dangerous thrusts of his long Spanish knife, he was 'choked' down and held fast.

My followers were for making short work with him. More than one had bared their blades to finish him upon the spot, and would have done so, had I not interfered. I was averse to spilling his blood, and by my intercession, his life was spared.

To prevent him from giving us further trouble, however, we tied him to a tree, in such a manner that he could not possibly free himself.

The mode of securing him was suggested by Stanfield the backwoodsman: it was simple and safe. A tree was chosen, whose trunk was large enough to fill the embrace of the savage, so that the ends of his fingers just met when his arms were drawn to their full stretch around it. Upon his wrists, thongs of raw hide were firmly knotted, and then tied together. His ankles were also bound by similar cords, the ends of which were staked, so as to hinder him from worming around the tree, and perchance wearing off his fastenings, or chafing them, so that they might break.

The ligature was perfect; the most expert jail-breaker could not have freed himself from such a binding.

It was our intention to leave him thus, and perhaps set him free upon our return, if we should return by that way—a doubtful hypothesis.

I thought not at the time of the cruelty we were committing. We had spared the Indian's life—a mercy at the moment—and I was too much concerned about the future of others, to waste reflection on his.

We had taken the precaution to leave him at some distance from the place of his capture; others of his party might come after, and discover him, soon enough to interfere with our plans. His prison had been chosen far off in the depth of the woods; even his shouts could not have been heard by any one passing along the trail.

He was not to be left entirely alone: a horse was

to be his companion—not his own—for one of the rangers had fancied an exchange. Stanfield—not well mounted—proposed a 'swop,' as he jocosely termed it, to which the savage had no alternative but consent; and the Kentuckian, having 'hitched' his worn-out nag to a tree, led off the skewbald mustang in triumph, declaring that he was now 'suar wi' the Indyens.' Stanfield would have liked it better had the 'swop' been made with the renegade who had robbed him.

We were about to leave the place and move on, when a bright idea suddenly came into my head: it occurred to me that I too might effect a profitable exchange with our new-made captive—a swop, not of horses, but of men—in short, an exchange of persons—of identities! In truth, a bright idea it was, and one that promised well.

I have said that I had already conceived a plan for the rescue of my betrothed: I had done so during the night, and all along the route, in my mind I had been maturing it. The incident that had just transpired had given rise to a host of new ideas—one, above all, that promised to aid me in facilitating the execution of my design. The capture of the savage, which had at first given me uneasiness, I now regarded in a very different light—as a fortunate circumstance. I could not help thinking that I recognised in it the finger of Providence, and the thought inspired me with hope. I felt that I was not forsaken.

The plan I had proposed to myself was simple enough; it would require more of courage than stratagem; but to the former I was sufficiently nerved by the desperate circumstances in which we had become involved. I proposed to enter the Indian camp in the night—of course, by stealth and under cover of the darkness—to find the captive—set her limbs free—and then trust to chance for the after escape of both of us.

If once inside the encampment, and within reach of her, a sudden *coup* might accomplish all this: success was not beyond possibility, nor probability neither; and the circumstances admitted of no plan that promised so fairly.

To have attempted fight with my few followers against such a host—to have attacked the Indian camp, even under the advantage of an alarm—would have been sheer madness. It must have resulted not only in our immediate defeat, but would have destroyed our last chance of rescuing the captive. The savages once alarmed and warned, could never be approached again. Isolina would be lost for ever.

My followers agreed with me upon the imprudence of an attack. Folly they termed it; not from any motives of fear: they were willing to risk all; and had I so ordered, would have charged with me, rifle in hand, into the very midst of the enemy's lines. I knew they would, every man of them. Even the voyageur—the least brave of my party—would not have flinched; for, in the midst of brave men, cowards cease to be.

But such a course would indeed have been folly—madness. We thought not of adopting it; all approved of the plan I had formed, and which I had already set before them as we tarried by the noon halting-place.

Several had volunteered to be my companions—to venture along with me into the camp of the savages; to share with me the extreme of the danger; but for several reasons I was determined to go alone. Should even one of them be along with me, I saw it would double the risk of detection. In this matter, stratagem, not strength, was needed, and speed in the last moments would be worth both.

Of course, I did not expect to get the captive clear without being observed and pursued—that would have been preposterous; she would be too well watched by the savages—not only by her jailers, but by the jealous eyes of those rival claimants of her body.

No; on the contrary, I anticipated pursuit—close and eager; it might be strife; but I trusted to my own swiftness of foot; and to hers; for well knew I her bold heart and free limb: it was no helpless burden I should have to bring away.

I trusted to my being able to baffle their pursuit—to keep them back while she ran forward. For that purpose, I should take with me my knife and revolvers—I trusted to these, and much to chance, or, perhaps, I should rather say to God. My cause was good—my heart firm and hopeful.

Other precautions I intended to take: horses ready as near as they might be brought; men also ready seated in their saddles, rifle in hand—ready for fight, or flight.

Such was the enterprise upon which I was resolved. Success or death was staked upon the issue. If not successful, I cared not to survive it.

CHAPTER LXXXIV.

'PAINTING INJUN.'

Withal, I was not reckless. If not sanguine, I was far from despondent; and as I continued to dwell upon it, the prospect seemed to brighten, and success to appear less problematical.

One of the chief difficulties I should have to encounter would be *getting into* the camp. Once inside the lines—that is, among the camp-fires and tents, if there should be any—I would be comparatively safe. This I knew from experience; for it would not be my first visit to an encampment of prairie-Indians. Even in their midst, mingling with the savages themselves, and under the light of their glaring fires, I should be less exposed to the danger of detection than while attempting to cross their lines. First, there might be outlying pickets; then within these the horse-guards; and within these, again, the horses themselves!

You may smile, when I assert that the last was to me a source of apprehension as great as either of the others. An Indian horse is a sentinel not to be despised. He is as much the enemy of the white man as his master; and partly from fear, and partly from actual antipathy, he will not permit the former to approach him. The human watcher may be negligent—may sleep upon his post—the mustang never. The scent of a white man, or the sight of a skulking form, will cause him to snort and neigh; so that a whole camp will either be *stampeded* or put upon the alert in a few minutes. Many a well-planned attack has been defeated by the warning-snort of the sentinel horse.

It is not that the prairie-horse feels any peculiar attachment for the Indian; strange if he did—since tyrant more cruel to the equine race does not exist—no driver more severe, no rider more hard than a horse-Indian.

It is simply the faithfulness which the noble animal exhibits for his companion and master, with the instinct which tells him when that master is menaced by danger. He will do the same service for a white as for a red man; and often does the weary trapper take his lone rest with full confidence that the right will be faithfully kept by his horse.

Had there been dogs in the Indian camp, my apprehensions would have been still more acute—the danger would have been more than doubled. Even within the lines, these cunning brutes would have known me as an enemy: the disguise of garments would not avail; by the scent, an Indian dog can at once tell the white from the red man; and they appear to hold a real antipathy against the race of the Saxon. Even in time of truce, a white man entering an Indian camp can scarcely be protected from the wolfish pack.

I knew there were no dogs—we saw tracks of some. The Indians had been upon the war-trail; and when

they proceed on these grand expeditions, their dogs, like their women, are left 'at home.' I had reason to be thankful that such was their custom.

Of course it was my intention to go disguised; it could have been madness to have gone otherwise. In the darkest night, my uniform would have betrayed me; but necessarily, in my search for the captive, I could be led within the light of the fires.

It was my design, therefore, to counterfeit the Indian costume; and how to do this had been for some time the subject of my reflections. I had been congratulating myself on the possession of the buffalo-belt. That would go far towards the disguise; but her articles were wanting to complete my costume. The leggings and moccasins—the plumed head-dress and neck ornaments, the long straggling locks, the bronze complexion of arms and breast—the piebald face of chalk, charcoal, and vermilion—where were these to be obtained? There was no *costumerie* in the desert.

In the moment of excitement that succeeded the capture of the savage, I had been thinking of other things. It was only when we were about to part from him that the idea jumped into my mind—that bright idea—that he could furnish me—the very man.

I turned back to reconnoitre his person. Dismounting, I scanned him from head to foot. With delight my eyes rested upon his buckskin-leggings, his bead-embroidered moccasins, his pendent collar of javaliskus, his eagle plumes, stained red, and the ample robe of jaguar-skins that draped his back—all pleased me much.

But that we were bent on an errand of peril, the fact would not have been left there. My followers had eyed it with avidity, and more than one of them had been desirous of removing it; but proximate peril had impeded the ardour for spoil, and the splendid robe had been permitted to remain where so gracefully it hung upon the shoulders of the savage.

It soon replaced the buffalo-robe upon mine; my boots were cast aside, and my legs encased in the calf-fringed leggings; my hips were swathed in the pattern 'breach-clout'; and my feet thrust into the hot-gear of the Comanche, which, by good-fortune, fitted to a hair.

There was yet much required to make me an Indian. Comanches upon the war-trail go naked from the waist upward—the tunic-shirt is only worn upon the hunt, or on ordinary occasions. How was I to counterfeit the copper skin—the bronzed arms and shoulders?—the mottled breast—the face of red, and white, and black? Paint only could aid me; and there was paint to be procured? The black we could mix with gunpowder, but —

'Wagh!' ejaculated Rube, who was seen holding in his hands a wolf-skin, prettily trimmed and garnished with quills and beads—it was the medicine-bag of the Indian. 'Wagh! I thort we'd find the matceruls in the nigger's possible-sack—hyur they be!'

Rube had dived his hand to the bottom of the embroidered bag; and, while speaking, drew it triumphantly forth. Several little leathern packets appeared between his fingers, which, from their stained outside, evidently contained pigments of various colours; whilst a small shining object in their midst moved, on closer inspection, to be a looking-glass!

Neither the trappers nor myself were astonished at finding these odd 'notions' in such a place; on the contrary, it was natural we should have looked for them there. Seldom in peace, but never in time of war, does the Indian ride abroad without his rouge and his mirror!

The colours were of the right sort, and corresponded exactly with those that glittered upon the skin of the captive warrior.

Under the keen edge of a bowie, my mustaches

came off in a twinkling: a little grease was procured; the paints were mixed; and placing myself side by side with the Indian, I stood for his portrait. Rube was the painter—a piece of soft buckskin his brush, the broad palm of Garey his pallet.

The operation did not last a great while. In twenty minutes it was all over, and the Indian brave and I appeared the exact counterparts of each other. Streak by streak, and spot by spot, had the old trapper imitated those hideous hieroglyphics—even to the red hand upon the breast, and the cross upon the brow. In horrid aspect, the copy quite equalled the original.

One thing was still lacking—an important element in the metamorphosis of disguise: I wanted the long snaky black tresses that adorned the head of the Comanche.

The want was soon supplied. Again the bowie blade was called upon to serve as scissors; and with Garey to perform the tonsorial feat, the *chevelure* of the Indian was shorn of its flowing glories.

The savage winced as the keen blade glistened around his brow; he had no other thought than that he was about to be scalped alive!

'Tain't the way I'd raise his har, the dodrotted nigger!' muttered Rube, as he stood watching the operation. 'Fotch the hide along wi' it, Bill! It'll save bother—ee'll hev to make a wig ef 'ee don't; skin 'im, durn 'im!'

Of course Garey did not give heed to the cruel counsel, which he knew was not meant for earnest.

A rude 'scratch' was soon constructed, and being placed upon my head, was attached to my own waving locks. Fortunately, these were of dark colour, and the hue corresponded.

I fancied I saw the Indian smile when he perceived the use we were making of his splendid tresses. It was a grim smile, however, and from the first moment to the last, neither word nor ejaculation escaped from his lips.

Even I was forced to smile; I could not restrain myself. The odd travesty in which we were engaged—the strange commingling of the comic and serious in the act—and above all, the ludicrous look of the captive Indian, after they had close cropped him, was enough to make a stone smile. My comrades could not contain themselves, but laughed outright.

The plume-bonnet was now placed on my head. It was fortunate the brave had one—for this magnificent head-dress is rarely worn on a war-expedition; fortunate, for it aided materially in concealing the counterfeit. The false hair could hardly have been detected even under the light of day.

There was no more to be done. The painter, hair-dresser, and costumier had performed their several offices—I was ready for the masquerade.

CHAPTER LXXXV.

THE LAST HOURS ON THE TRAIL.

More cautiously than ever, we now crept along the trail, advancing only after the ground had been thoroughly 'quartered' by the scouts. Time was of the least consequence. The fresh sign of the Indians told us they were but a short way ahead of us: we could have ridden within sight of them at any moment.

We did not wish to set eyes on them before sunset. It could be no advantage to us to overtake them on the march, but the contrary. Some lagging Indian might be found in the rear of the band; we might come in contact with him, and thus defeat all our designs.

We hung back, therefore, allowing time for the savages to pitch their camp, and for their stragglers to get into it.

On the other hand, I did not desire to arrive late. The council was to be held that night—so she had learned—and after the council would come the crisis. I must be in time for both.

At what hour would the council take place? It might be just after they had halted. The son of a chief, and a chief himself—for the white renegade was a leader of red men—a question between two such men would not remain long undecided. And a question of so much importance—involving such consequence—property in body and soul—possession of the most beautiful woman in the world!

Oh! I wondered! Could these hideous, ochre-stained, grease-bedaubed brutes appreciate that peerless beauty? Impossible, I thought. The delicate lines of her loveliness would be lost upon their gross eyes and coarse sensual hearts. That pearl beyond price—paste would have satisfied them as well—they could not distinguish the diamond from common glass.

And yet the Comanche is not without love-craft. Coarse as might be the passion, they must have loved her—both must have loved her—red savage and white savage.

For this very reason, the 'trial' would not be delayed; the question would be speedily decided, so that the quarrel of the chiefs might be brought to an end. For this very reason, the crisis might be hastened, the council take place at an early hour; for this very reason, I too must needs be upon the spot at an early hour.

It was my aim to arrive within sight of the Indian encampment just before night—in the twilight, if possible—that we might be able to make reconnaissance of the ground before darkness would cover it from our view. We were desirous of acquainting ourselves with the lay of the surrounding country as well, so that, in the event of our escape, we should know which was the best direction to take.

We timed our advance by the sign upon the trail. The keen scouts could tell, almost to a minute, when the latest tracks were made; and by this we were guided. Both glided silently along, their eyes constantly and earnestly turned upon the ground.

Mine were more anxiously bent upon the sky; from that quarter I most feared an obstacle to the execution of my purpose. What a change had come over my desires!—how different were they from those of the two preceding nights! The very same aspect of the heavens that had hitherto chagrined and baffled me, would now have been welcome. In my heart, I had lately execrated the clouds; in that same heart I was now praying for cloud, and storm, and darkness!

Now could I have blessed the clouds—there were none to bless; not a speck appeared over the whole face of the firmament—the eye beheld only the illimitable ether.

In another hour, that boundless blue would be studded with millions of bright stars; and, silvered by the light of a resplendent moon—the night would be as day.

I was dismayed at the prospect. I prayed for cloud, and storm, and darkness. Human heart! when blinded by its own petty passions, unreasoning and unreasonable; my petition was opposed to the unalterable laws of nature—it could not be heard.

I can scarcely describe how the aspect of that bright sky troubled and pained me. The night-bird, which joys only in deepest darkness, could not have liked it less. Should there be moonlight, the enterprise would be made more perilous—doubly more. Should there be moonlight—why need I form an hypothesis? Moonlight there *would* be to a certainty. It was the middle of the lunar month, and the moon would be up almost as the sun went down—full, round, and almost as bright as he, with no cloud to cover her face—to

shroud the earth from her white diaphanous light. Certainly there would be moonlight!

Well thought of was that disguise—well spent was our labour in making it so perfect. Under the moonlight, to it only could I trust; by it only might I expect to preserve my incognito.

But the eye of the Indian savage is sharp, and his perception keen—almost as instinct itself. I could not rely much upon my borrowed plumes should speech be required from me. Just on account of the cunning imitation, the perfectness of the pattern, some friends of the original might have business with me—might approach and address me. I knew but a few words of Comanche—how should I escape from the colloquy?

Such thoughts were troubling me as we rode along the trail.

Night was near; the sun's lower limb rested on the far horizon of the west: the hour was an anxious one to me.

The scouts had been for some time in the advance without returning to report; and we had halted in a cove to wait for them. A high hill was before us, wooded only at the summit; over this hill the way-trail led. We had observed the scouts go into the timber. We kept our eyes upon the spot, waiting for their return.

Presently one of them appeared just outside the edge of the wood—Garey, we saw it was. He made signs to us to come on.

We rode up the hill, and entered among the trees; here we diverged from the trail. The scout guided us through the trunks over the high summit. On the other side, the wood extended only a little below; here we did not ride beyond it; we halted before coming to its edge, and dismounting, tied our horses to the trees.

We crept forward on our hands and knees till we had reached the utmost verge of the timber; through the leaves we peered, looking down into the plain beyond. We saw smokes and fires, and a skin-lodge in their midst; we saw dark forms around—men moving over the ground, and horses with their heads to the grass: we were looking upon the Comanche camp.

CHAPTER LXXXIV.

THE COMANCHE CAMP.

We had reached our ground just at the moment we had desired. It was twilight—dark enough to render ourselves inconspicuous under the additional shade of the trees, yet sufficiently clear to allow a full reconnaissance of the enemy's position. Our point of view was a good one—under a single *coup d'œil* commanded the encampment, and a vast extent of country around. The hill we had climbed—a sort of isolated *butte*—was the only eminence of any considerable elevation for miles around; and the site of the camp was upon a plain that stretched away from its base—apparently beyond limit.

This plain was what is termed a 'pecan' prairie—that is, a prairie half-covered with groves, copses, and lists of woodland—in which the predominant tree is the pecan—a species of hickory (*carya albertaensis*), bearing an oval, edible nut of commercial value. Between the groves and *mottes* of timber, single trees stood apart, their heads fully developed by the play given to their branches. These park-like trees, with the coppice-like groves of the pines, lent an air of high civilisation to the landscape; and a winding stream, whose water, under the still *languid* rays, glistened with the sheen of silver, added to the deception. Withal, it was a wilderness—a beautiful wilderness. Human hands had never planted these groves—human agency had nought to do with the formation or adornment of that lovely landscape.

Upon the bank of the stream, and about half a mile from the base of the hill, stood the Indian camp. A

lance at the position shewed how well it had been chosen—not so much for defence, as to protect it against a surprise.

Assuming the lodge—there was but one—as the centre of the camp, it was placed upon the edge of a tall grove, and fronting the stream. From the tent, the water's edge, the plain sloped gently downward, to the glacis of a fortification. The smooth sward that covered the space between the trees and the water was the ground of the camp. On this could be seen the dusky warriors, some aloft, standing in various attitudes, or moving about; others reclining upon the grass, and still others bending over the fires, as if engaged in the preparation of their evening meal.

A line of spears, regularly placed, marked the allotment of each. These slender shafts, nearly five yards in length, rose tall above the turf, like masts of distant ships, displaying their profusion of pennons and banners, of painted plumes and human hair. At the base of each could be seen the gaudy shield, the bow and quiver, the embroidered pouch and medicine-bag of the owner; and grouped around many of them appeared objects of a far different character—objects that we could not contemplate without acute emotion. They were women: enough of light still ruled the sky to shew us their faces; they were white women—the captives. Strange were my sensations as I regarded these forms and faces; but they were far off—even a over's eye was unequal to the distance.

Flanking the camp on right and left were the horses. They occupied a broad belt of ground, for they were led out to feed, and each was allowed the length of a lazo. Their line converged to the rear, and met behind the grove, so that the camp was embraced by a sort of browsing animals, the river forming its head. Across the stream, the encampment did not extend.

I have said that the spot was well selected to guard against a surprise. Its peculiar adaptability consisted in the fact, that the little grove that backed the camp was the only timber within a radius of a thousand yards. All around, and even on the opposite side of the stream, the plain was treeless and free from cover of any kind. There were no inequalities of ground, neither 'brake, bush, nor scaur' to shelter the approach of an enemy.

Had this position been chosen, or was it accidental? At such a place and at such a time, it was not likely that I had any fear of a surprise; but with the Indian, caution is so habitually exercised, that it becomes almost an instinct; and doubtless under such an impulse, and without any forethought whatever, the horses had aptly fixed upon the spot where they were camped. The grove gave them wood; the stream, water; the plain, pasturage for their horses. With all of these last for their own food, they had all the requisites of an Indian camp.

At the first glance, I saw the strength of their position—not so much with the eye of a soldier, as with that of a hunter and bush-fighter did I perceive it. In a military sense, it offered no point of defence; but it could not be approached by stratagem, and that is the horse-Indian's ever fear. Alarm him, not too suddenly, give him five minutes' warning, and he cannot be attacked. If superior in strength, you may force him, but you must be better mounted than he to bring him to close combat. Retreat, not defence, is generally the leading idea of Comanche strategy, when opposed to a Mexican foe. Then he will stand fight with the courage of a master.

As I continued to gaze at the Indian encampment, my heart sank within me. Except under cover of a dark night, a very dark night, it could not be entered. The nearest spy could not have approached it: it appeared unapproachable.

The same thought must at that moment have

occupied the minds of my companions; I saw the gloom of disappointment on the brows of all, silent and sullen. None of them said a word; they had not spoken since we came upon the ground.

PRESENT STATE OF THE BESSEMER QUESTION.

It is only some few months since all Europe was standing on tiptoe, in expectation of witnessing a great and marvellous revolution in the manufacture of iron and steel, by a new and ingenious process, to which it is only necessary to allude in passing as that patented by Mr Bessemer. It was something quite astounding to those who knew by what tedious and expensive means steel was produced from iron in the olden time, to be told that, by the new process, steel was the easier and cheaper production of the two. It was no less wonderful in the eyes of those who had considered iron as, at least in the open air, an incombustible, to be shewn that it was, in fact, a highly combustible material; and that, if once heated by fire to a certain point, it might then, by strong air-currents, be actually *itself set on fire*, and made to burn with a fierce incandescence.

It is humiliating to think upon what small matters great ones often depend. There appears to be no reasonable doubt that Mr Bessemer would have realised all he promised to accomplish but for one slight circumstance, which it is our intention now to explain, and the difficulty connected with which has, at least for the present, frustrated his expectations.

The subject of iron-founding has been so completely popularised by the discussions of this patent in the public press, that it will only be necessary for us to recall attention to the fact, that iron ore contains several foreign matters in intimate combination, and that upon their expulsion during the founding process depends the success of the ironmaster's work. These foreign bodies are chiefly carbon, silicon, sulphur, and phosphorus. The old methods of roasting, casting, refining, puddling, and rolling were found to effect the object in view sufficiently for all practical purposes. In Mr Bessemer's process, all these substances, *except phosphorus*, are effectually expelled. It would seem that up to the present time this material has resisted all the efforts of Mr Bessemer. It defies the utmost heat of his furnaces, and has no sufficient affinity for oxygen, or any other body brought in contact with it, to consent, for its sake, to let go its tenacious grasp of the iron. Now, phosphorus in iron is, as it appears, fatal to the useful qualities of the metal; it renders the iron brittle and unserviceable; and as no portion of it can be detected in the *slag* of the furnace, it would seem that, so far as its expulsion is concerned, Mr Bessemer has as yet altogether failed. But it would surely not be at all philosophical to conclude that the question is finally set at rest, however serious the objection may be to which we have now called attention. It can hardly be too much to expect that in the resources of modern science some ingredient may yet be discovered, the results of which, in the instance before us, will be no less striking than those of soda, borax, and potash, when used as fluxes in various industrial operations. We should not be surprised any day to hear that some such depurative had been discovered, and that its admixture with the incandescent iron in the furnace was found to detach the phosphorus, and leave the iron in a perfectly pure state. We wish we could go further than suggest the existence of some such drug, or metal, or mineral, whatever it may be. We suspect that the man who could go further than this, and supply Mr Bessemer with its local habitation and its name, would participate

largely in a most lucrative as well as scientifically honourable discovery.

We could ourselves easily indicate certain metallic combinations which, in dealing with phosphorus in its uncombined state, possess the power of neutralising its caustic properties; but this may be far indeed from indicating a power in such preparations to deal with that wonderful substance as it is found in nature, united with the crude oxide of iron. Indeed, we take for granted that men of the highest mark in chemical science are just now eagerly devoting their attention to this interesting problem; and, as we have said, we look forward rather hopefully than otherwise to the result.

We are very far from participating in the triumph expressed by many at the partial, and, in truth, temporary failure in the expectations raised in the public mind by Mr Bessemer and his discoveries; but it is still true that, up to the present time, the 'revolution' has not come off. The new aspirants for dominion in the realms of metallurgy—we mean, of course, air-blast and oxygen—have not as yet been able to wrest the sceptre from the hand of 'Old King Coal.' His carbonaceous majesty is still 'master of the situation;' how long he may continue so, we by no means venture to take on ourselves even to conjecture.

A LEAP IN THE DARK.

ONE of the gentlemen who visited Mount Sinai in company with Bishop Clayton, happened, on his return to England, to pass through Sicily. Though by no means a person of romantic character, he had a fancy for wandering about mountains, for getting belated in forests, and supping by the light of wood-fires under a rock. It was perfectly natural, therefore, that he should wish to visit Mount Etna, look at the great chestnut-trees, and examine that marvellous belt of vegetation, so admirably described by the commandant Dollinian, which encircles the cone of the volcano, and marks the point at which in general the streams of lava are arrested in their downward progress.

Our traveller's unromantic name was Fennel, and he had along with him two friends, considerably younger than himself, the one a clergyman, the other a barrister. Two servants, not much accustomed to sojourn in strange countries, rough Yorkshiremen, speaking their native dialect in perfection, and despising everything not English, waited upon the triad of travellers; and when they left Catania, two guides were hired to conduct the party through the labyrinth of woods, gorges, glens, ravines, and precipices which intercepts the ascent to the crater, and renders it at all times an enterprise of considerable danger.

For nearly a week before they set out, the mountain had exhibited some symptoms of internal uneasiness. Earthquakes passed like gentle tremors beneath the city—not rocking or heaving up the earth—not cracking the walls, or dismantling the houses—but just giving a tremulous motion to the pavement under your feet, and at night causing the pillow under your head to seem for an instant about to float away. To the Catanians, this was nothing: they had been used to it from the cradle. Their houses all stood upon lava, were built with lava; the detritus of lava formed the very soil in their gardens, and the fruits they ate had a rich lava relish. In some sense, they were half lava themselves—cold without, fiery within, feeling much, reflecting little, always on the brink of an impassioned eruption, but kept from running over, except at widely distant periods, by the paucity of materials in their constitution.

Mr Fennel, as a true Englishman, loved to see sights, and therefore longed for an eruption; but the Catanians assured him he would have to wait at

least a month, in order to enjoy that peculiar spectacle. He determined to wait two months if necessary; but in the meantime, thought it would be pleasant and interesting to run up and get a peep at the crater. The wind blew strongly from the west, and spun out the dusky smoke into long ribbons in the air. Once or twice in the night, he thought he could detect red sparks among the fuliginous vapour, which now and then increased largely in volume, and issued from the breast of the mountain with something like a deep grunt. The young clergyman observed jocularly that Enceladus was snorting or snoring in his sleep. But the barrister, familiar with the slang of men about town, maintained that there was a row among the Titans, and that Typhoeus having got Mr Enceladus's head into Chancery, was pommelling him about the nob, and making him seek to deliver himself with fierce puffing and contortions. Mr Fennel laughed at their absurdity, which he did not even pretend to mistake for wit, and determined to set out early in the evening to see with his own eyes, as he expressed it, what it was all about. At the hour appointed, the mules were ready, and off they went. To describe what they saw, what they felt, what they thought, and what they said, would fill a volume of no small dimensions. Sicily is big, every inch of it, with wonder; and no writer, so far as I know, has succeeded in conveying to an untraveller reader any idea of its awe-inspiring scenery. You know very well that every step you take conducts you over unfathomable gulfs of fire, from which you are separated only by a thin crust, which may at any moment crack and fall in. You know that interminable beds of sulphur extend from the great volcanic peak in unnumbered leagues out beneath the sea, and that for thousands of years they have supplied fuel to that prodigious fireplace, whose chimney rises 10,000 feet towards the empyrean. You feel mingling with the air you breathe the warmth of that mighty conflagration, which, forcing its way throughout the earth and the rocks, communicates a luxuriance to every kind of vegetation unknown in other parts of the world. But in spite of this knowledge, you are led, by the example of the inhabitants, to put confidence in appearances, and to imagine that those more stupendous Phlegrean fields will continue safely for your time to hang floating over subterranean fires, displaying their beauty and their sublimity, and concealing altogether from the eye the fearful apparatus by which their splendours are produced.

As everybody knows, the ascent of Mount Etna is not to be accomplished in an hour or two. If you wish to reach it by daybreak, that you may witness sunrise from its summit, you must set out early the evening before. If your mules are vigorous, you may perhaps find time for a short nap, a little after midnight, and recommence the ascent about three o'clock. In the case of Mr Fennel and his companions, the mules performed their part with great perseverance and fidelity. If you have travelled by night in a mountainous and woody country, you must know what an exciting thing it is; what gulfs of shadow you gaze at from time to time, straining your eyes in vain to penetrate into their depths; what towering precipices nod and frown over you; what sounds, wild and startling, and proceeding from you know not what cause, come at intervals through the woods; and how your heart beats with something very much like fear, but yet not unmingled with pleasure, as you spring over chasms, after the example of your guide, and climb zigzag along the face of cliffs which seem inclined to carry you up higher than Babel's projected tower into the sky!

It was already one o'clock, when the guides, who are perfectly despot during such undertakings, pronounced it time to halt and take a little refreshment after which, if so inclined, the whole party, they said,

might sleep for two hours without running the least risk of not reaching the edge of the crater by sunrise. They did halt; and while the servants were kindling a fire with dried wood, which lay about in plenty, Mr Fennel amused himself with looking down the vast sweeps of the mountain towards the sea. In that part of the world, nobody appears to sit up late; and at the time to which I now refer, the Sicilian cities had no lamps. You consequently beheld nothing on shore, save dusky irregularities descending and undulating to the extreme verge of the shore. But the sea, when it bares its breast to the stars, has always a faint glimmer diffused over it. On the present occasion, there were patches of phosphorescence which, like small luminous isles, flashed and floated between you and the Tarentine promontory. Science may dissipate as it pleases the mystery of these phenomena, but nothing can still that disquietude of the heart with which you contemplate the waves on fire, looking like so many glowworms several leagues in dimensions, floating leisurely away before the wind. From enjoying this curious prospect, Mr Fennel was called away by the announcement that supper was ready. He then joined his companions, ate, drank, and went, wrapped in his cloak, to sleep, like a red Indian, with his feet towards the fire.

We men are very clever in our way, but nature is often too many for us. According to their day and generation, those travellers were highly scientific, knew all about volcanoes, could dissertate learnedly on gases, and decide beforehand to an inch how far a heavy body, by whatever cause put in motion, could travel in two hours. With regard to the guides, it was altogether impossible that they could ever be taken napping: they understood all the tricks of Etna as well as he did himself, and could always decide whole days beforehand what he was going to do next. Nevertheless, he now stole a march upon them. Awaking with a start, they were surprised at feeling a warmth much greater than their wood-fire was calculated to impart; the sky, moreover, was filled with a blood-red glare, which bewildered at once their senses and their imagination, and the terrible idea suggested itself to their minds that the eruption was in full progress. Indeed, they had but to look around them to discover undeniable proofs of it. They were standing on a knoll skirted on the side of the cone with trees, and on the right and left, a broad stream of fire, glowing like a furnace, was rushing down into the plain, overthrowing everything in its passage—trees, rocks, and, where it encountered them, human dwellings. Never did Mr Fennel witness anything so awful as the red glare cast upon the woods by the desolating torrent as it swept on. He turned to the guides, who stood beside him paralysed with terror.

'How are we to get out of this situation?' inquired he.

'We don't know,' they replied; 'we have never before been placed in such circumstances. But we must make some movement, and that speedily, too, or we shall be burned to cinders where we stand. Look! the lava is coming; and those vast trees are bending and cracking at its touch like fine grass.'

'Well,' replied the traveller, 'lead the way—you must know it better than we—that we may get out into the plain country before the fiery streams meet below, and hem us in.'

'You are right,' declared the guides; 'for the lava is pursuing the course of two ravines which have their confluence below yonder hill; and if we fail to precede them, we are lost.'

The jokers of the morning were not at all inclined to joke now. The lava was sending its intolerable heat before it, warning them that inevitable death was near unless they escaped from it by miraculous

celerity. Down the mountain, therefore, they went, leaving everything behind them but the iron-shod staves which they carried in their hands. The landscape, previously so silent, was now filled on all sides with fearful noises—the bellowing of terrified herds, the shouts and shrieks of human beings, the sudden bursting up of flames here and there, as the torrents reached some combustible matters, the tumbling down of rocks, and the crash of forests, as the irresistible lava forced its way through them. Every moment the glowing flood rose higher and higher, until it overflowed its banks, and began to diffuse itself over the rocky plateau along which the travellers were rushing towards the distant city. At length they came suddenly upon the edge of a precipice, down which they looked, but could discern no bottom. On the right and left was the fire; in front, a gulf of unknown depth; behind, the lava rolling towards them with terrific rapidity, scorching, in its advance, trees, grass, nay, the very earth, which it absorbed and liquefied by its indescribable heat.

'Are you ignorant of this cliff?' inquired Mr Fennel; 'or may we hope to save our lives by throwing ourselves over?'

'It lies entirely out of our usual track,' replied the men, 'and we have never seen it before.'

I do not pretend to describe Mr Fennel's feelings at that moment, because he has left behind him no record of them. It is well known that extreme danger often renders men silent: they do not converse, do not discuss their means of escape, do not communicate their fears; their mental powers appear for the moment to be annihilated—they only feel. But what feelings are theirs! All Sicily now appeared to be on fire. The earth was reddening on every side; the sky overhead glowed like a furnace-mouth, and clouds dense, charged with igneous particles, and emitting an intolerable stench, were precipitated upon them by the west wind. To be scorched to death, or suffocated, appeared now inevitable, unless they threw themselves over the precipice, and so delivered themselves from such fate by suicide. While they were meditating on this idea, the earth under them began to rock violently. It shook: there was a wild crash; the rock parted and yawned, and they beheld a red streak making its way eastward through the bottom of the crevice. They fled, not knowing whither, towards the left; but their progress was soon arrested by the heat thrown out by the lava. All thoughts, all eyes, were now directed towards the precipice: should they dash over, and, by one leap in the dark, either deliver themselves from the most fearful of deaths, or put an end to their agonies at once? With sensations which baffle all description, they approached the edge of the rock, and looked over it. Could they discern anything below? No; all was thick darkness, suggesting unfathomable depth. They would remain therefore where they were, in the hope that the lava might rise no higher, and that when the light of day should make its appearance, they might see some avenue of deliverance. But this hope the guides dissipated. They knew too well that the lava-streams now separated would meet and mix before morning, and leave not one inch of the ground they now stood on unflooded by fire. Yet all hesitated to plunge down they knew not whither in the dark. While they lived, while they breathed, something like a miracle perhaps might occur to preserve them. They would therefore hope, and defer taking the fatal plunge till there should be nothing else left them. It soon came to this: the fiery circle became contracted, the heat and the sense of suffocation intolerable, and at length the young clergyman, with a mixture of horror and resignation in his countenance, volunteered to make the first plunge. In spite of the volcanic glow, his face assumed the hue of death as he approached the rock. He did not dash forward—he did not throw

himself headlong—he turned round, and clinging to the rock with his hands, remained there suspended for a moment, and then—

What was that noise?—that of a body dashing against the rocks—down, down fearfully into some unfathomable gulf. The survivors shouted in agony, and besought him to reply if he still lived. But no answer. Mr Fennel then said it was his turn, and in the same way he committed himself into the depths of air. There was another pause of suspense and agony. Again the survivors listened: again no answer came. Then followed the barrister; and after that, pell-mell, rushed down servants and guides, and there was silence. They had all taken the leap in the dark, and were they on the shores of Acheron? The precipice, if I may borrow an Hibernianism for the occasion, was no precipice at all, but a very shallow rock, with soft grass growing up to its base. Why, then, did they who leaped not answer? They thought they were going to inevitable death, and that thought for a moment paralysed them, so that they did not recover the use of speech for several minutes. Those minutes had appeared an age to those who awaited a reply. But, long as the time seemed, there elapsed, probably, only a few seconds between the plunge of the clergyman and the simultaneous spring of the servants and guides. What roused them at last was the lava glow, flashing upon them from the rocks above. They rose with a feeling of indescribable gratitude, mingled with fear, and hastened eastward over the plain. They were not yet beyond the reach of the Etnean surges, and therefore pushed along with eager speed till they reached the point where the lava-streams must soon have their confluence. They dashed through the gap—they ascended the rocks on the side of Catania, and soon stood upon a high terrace before the city walls, from whence they beheld Etna vomiting forth in smoke and thunder those red torrents, which, at wide intervals, desolate and fertilise the plains of Sicily, suggesting ideas of immeasurable antiquity, since all that part of the island has been gradually created by the mountain. With sobered feelings, and curiosity thoroughly quenched, Mr Fennel set sail, on the following day, for England, where he often spoke of his leap in the dark.

FRIDAY AN UNLUCKY DAY?

NONSENSE: it is nothing of the kind. And the best way to prove this, if we would only take the trouble so to do, is to collect and adduce groups of instances in which joys and successes, happy enterprises, fortunate determinations, world-improving schemes, have been initiated on Friday. Do not, good reader, deem this process of proof beneath you: it is always worth while to remove prejudices; for to shew the fallacy of aught that is untrue, is to render due allegiance to that august lady who is said by some learned men to 'live at the bottom of a well.'

Not that we can ever remove such prejudices entirely. To whatever subject science has not yet reached, there luck and ill-luck maintain a sovereignty in popular belief. Lucky numbers have had a prodigious reputation ever since the days of the astrologers, and long before. Three, four, five, six, seven, nine, ten, twelve, twenty-one—all have had advocates, as being numbers to which certain special attributes pertain. Number seven had a long reign, but it is being gradually deposed; for the talk of seven metals and seven planets will no longer accord with the discoveries of modern times. We know—indeed the number of such believers is still considerable—a person of education and general good sense, who would refuse to sit down at table if the number of diners were thirteen; he

would rather have a domestic servant included among the guests, or would go without his own dinner, or would retain a supplementary guest at hand for exigencies, than be placed under the cloud of the dreaded thirteen. Ask him why; he can only say it is 'unlucky.' Ask him why it is unlucky; he can only say, 'because it is.' In the old days of lotteries, when it was optional in the purchaser to select a ticket of any particular number, the theory of lucky and unlucky numbers was in full power. Some adventurer in the lottery would select the number representing his own age; another, the current year of the Christian era; another, the year in which he was born; another, the number of pounds in the greatest prize; another, a number revealed to him in a dream. The *Spectator* discourses of a nonconformist, who being a great enemy to popery, and believing the bad men are the most fortunate in this world, selected 666 against any other number, because it is the number of the Beast. Lotteries are now dead by law in England; but let us only look down the advertising columns of the sporting newspapers, and consider how astounding is the credulity there implied; seeing the men will give money to knavish charlatans for the expression of a *guess* concerning the name of the horse that will win in the forthcoming Derby, Oaks, or St Leger race. If a man would toss heads and tails with himself, it would be better; for the guess would be just as good, and he would save the charlatan's fee, but in either case, it is a relic of the old feeling, belief in lucky numbers or lucky names.

Certain days of the year have had celebrity, either lucky or unlucky days; sometimes only in the thought of individuals, but occasionally throughout wide circles of society. There was a queer little volume published two centuries ago, something midway in character between Buchan's *Domestic Medicine* and the *Yankee's Best Companion*, in which it is said: 'Six days of the year are perilous of death; and therefore philosophers forbid men to let blood on them, or take any drink: that is to say, January 8, July 1, October 4, April 80, August 1, December 21. These six days with great diligence ought to be kept, but mainly the latter three, for all the veins are then full. . . . any child be born in these three latter days, they shall die a wicked death.' In an old Roman calendar, of the 18th of December, prognostications of the week were drawn for the whole year. Another old weather-book asserts that the feast of St Barnabas and the feast of St Simon and St Jude are often tempestuous days. A writer of the Elizabethan times enumerates no less than sixty 'unlucky' days in the year; the month of January was especially unfortunate in the matter; for the 1st, 2d, 4th, 5th, 10th, 15th, 17th, and 29th days of this month were included in the date catalogue. The ancients had their *dies albi* and *dies atri*—'white days' and 'black days.' St Augustine, in commenting on a passage in St Paul's epistle to the Galatians, says that it was meant to apply to those persons who regulated their conduct by reference to the particular day of the month, or to the age of the moon, or to the relative positions of the planets, or to the year being leap-year, &c. There are many calendars and breviaries, produced before the days of printing, which contain a sort of calendar in Latin enumerating the days in the year which are to be regarded as unlucky: these are January 1 and 2, February 8 and 4, March 1 and 4, April 10 and 11, May 7, June 10 and 15, July 10 and 18, August 1 and 2, September 3 and 10, October 3 and 10, November 3 and 5, December 7 and 10; all kinds of misadventures, slaying, dying, blood, wounds, death, treachery, malaria, serpent-bites, &c.—are associated with these

perplexity, however, the unlucky days do not at all accord with those given by the Elizabethan writer. A treatise was published in 1687 with the sole purpose of proving that the 14th of October is a lucky day; because 'our magnanimous magnificent sovereign, James II., was born upon that augural day;' because that day

Gave the Norman duke

That victory when he England's sceptre took;

because Edward III. safely landed on that day after his tempestuous voyage from France; because the siege of Calais by the French king was frustrated on that day; and because on that day, in 1557, a treaty of peace was signed between Rome, France, and Spain. When a date is said to have some connection with a particular state of the weather, the assertion is worthy of a little more attention; since modern meteorologists have found themselves justified in looking out for meteors on certain days in August and November, and since the sun's place in the ecliptic may have much to do with the weather; therefore, when it is stated that the feast of St Barnabas, and that of St Simon and St Jude (June 11th and October 28th) are likely to be stormy days; or when it is stated by Dr Forster in his *Perennial Calendar*, that the 15th of September is fine in six years out of seven—the assertion may possibly rest rather upon science than upon superstition.

Particular days of the week, again, have had their lucky and unlucky attributes in the minds of some persons. Stow remarks that Thursday was connected with many disastrous events in the career of Henry VIII. and those of his line. A book published during the reign of Charles I., discoursed on the unlucky characteristics of three Mondays in the year—namely, the first Monday in April, as that on which Cain was born and Abel was slain; the second Monday in August, as that on which Sodom and Gomorrah were destroyed; and the last Monday in December, as that on which Judas was born. In the old *Statistical Account of Scotland*, under the heading of Logierait in Perthshire, the inhabitants of the parish are spoken of as being prone to the belief in lucky and unlucky days. 'The day of the week on which the 14th of May happens to fall, for instance, is deemed unlucky through all the remainder of the year. In fevers, the illness is expected to be more severe on Sunday than on other days of the week; if easier on Sunday, a relapse is feared.' In the parish of Kirkwall, the same authority states that many of the inhabitants 'will neither go to sea in search of fish, nor perform any sort of work at home,' on certain days of the year. In Caithness, 'no gentleman of the name of Sinclair will put on green apparel, or think of crossing the Ord, upon a Monday. They were dressed in green and they crossed the Ord upon a Monday on their way to the battle of Flodden, where they fought and fell in the cause of their country, almost without leaving a representative of their name behind them. The day and the dress are accordingly regarded as inauspicious. If the Ord must be got beyond on Monday, the journey is preferred by sea.' Supposing these statements to be true, in reference to the time when Sir John Sinclair collected the materials for his valuable work, it would be interesting to know whether the subsequent period has been marked by any changes in the popular belief in question.

But Friday is the unlucky day, *par excellence*, according to the opinion of the million. Singular, indeed, is it to notice how wide-spread is this credence or credulity. Some writers, who claim to know all about the chronology of early events, even to days and hours, tell us that Adam and Eve ate the forbidden fruit on Friday, and died on Friday; hence the inauspicious characteristics of that day. Others have picked out a few Fridays in connection with

events and persons at the time of the introduction of Christianity, and have made poor Friday responsible for ever afterwards. For the greater part, however, the dictum has been accepted without any troublesome inquiry into its cause or authority: we know that the cat breaks everything, no other culprit coming forward; and on some such principle, Friday is selected as a scapegoat among the days of the week. The Spaniards have a pretty general opinion that it is unlucky to begin any enterprise on a Friday; and the Finlanders couple that day with Monday in the same bad list. The *Statistical Account of Scotland*, already quoted, tells us that, half a century ago, in some parts of Banffshire, 'few persons would choose to be married on a Friday.' Richard Cœur de Lion was killed on a Friday; and the event was chronicled in a ballad, in which Friday is frowned upon for evermore. A Shropshire adage holds the balance evenly between this day and the other days of the week; for it announces that Friday has always either the *best* or the *worst* weather in the week. Seamen are the most redoubtable defenders of the ill-Friday theory; they generally dislike to start for a voyage on that day; and some of the bluff old admirals and captains are believed to retain the prejudices in this matter imbibed in the early days when they served before the mast. In 1848, it was whispered at one of our southern ports that the port-admiral had delayed the departure of a ship in the government service for one day, in order that Friday might give place to the better-omened Saturday. If you tell a seaman this is pure nonsense, he will quote you instances in abundance. He will adduce the case in which, to disabuse sailors of their prejudice, a shipowner caused a ship to be laid down on Friday, launched on Friday, sent forth on her first voyage on Friday, and placed under the command of a captain named Friday: the ship was never again heard of. He will tell you that the *Amazon* West India mail-steamer left Plymouth on her first voyage on Friday, January 2, 1852, and was burnt to the water's edge, with a loss of 115 lives; and that the *Birkenhead* troop-steamer, which left Southampton on that very same day, was wrecked in her voyage, with a loss of 454 lives. He will tell you that one of the survivors of the *Amazon* joined the ship on a Friday, procured his register-ticket on a Friday, received his appointment on a Friday, left London in the ship for Plymouth on a Friday, and sailed from that port on a Friday; and that a foreboding of disaster arose in his sailor-mind when this list of Fridays came to his recollection.

But what the sailors have *not* told, and what the ill-Friday believers have not cared to inquire about, is the number of disasters that occur upon, and are associated with, the other six days of the week. Let them give poor Friday fair-play, and he will come up to a level with his companions. If it be a catalogue of shipwrecks, burnings, or other disasters, why not inquire whether such do not occur on the other days of the week in as large number as on Friday? If it be a list of fortunate or happy events, why not search candidly for a fair seventh of these on Fridays? The Great Mogul, Aurungzebe, is said to have exclaimed: 'O that my death may happen on a Friday, for blessed is he that dieth on that day!' but as we do not know why he adopted this theory, we can say nothing further about it. As an example, however, of the mode in which a sensible person may upset a stupid prejudice, we will quote a passage from an American newspaper, shewing that the great republic, at all events, has had no reason to consider Friday an unlucky day: 'On Friday, August 21, 1492, Christopher Columbus sailed on his great voyage of discovery; on Friday, October 12, 1492, he first discovered land; on Friday, January 4, 1493, he sailed on his return to Spain, which, if he

had not reached in safety, the happy result would never have been known which led to the settlement of this vast continent; on Friday, March 15, 1493, he arrived at Palos in safety; on Friday, November 22, 1493, he arrived at Hispaniola, on his second voyage to America; on Friday, June 13, 1494, he, though unknown to himself, discovered the continent of America. On Friday, March 5, 1496, Henry VII. of England gave to John Cabot his commission, which led to the discovery of North America: this is the first American state-paper in England. On Friday, September 7, 1565, Melendez founded St Augustine, the oldest town in the United States by more than forty years. On Friday, November 10, 1620, the *Mayflower*, with the Pilgrims, made the harbour of Province Town, and on the same day they signed that august compact, the forerunner of our present glorious constitution. On Friday, December 22, 1620, the Pilgrims made their final landing at Plymouth Rock. On Friday, February 22, George Washington, the father of American freedom, was born. On Friday, June 16, Bunker Hill was seized and fortified. On Friday, October 7, 1777, the surrender of Saratoga was made, which had such power and influence in inducing France to declare for our cause. On Friday, October 19, 1781, the surrender at Yorktown, the crowning glory of the American arms, occurred. On Friday, July 7, 1776, the motion in congress was made by John Adams, seconded by Richard Henry Lee, that the United States colonies were, and of right ought to be, free and independent.* We have not verified these dates; but supposing them to be correct, they certainly send Friday up to a premium, so far as America is concerned. But we do not want any premiums: all we ask is—*fair-play for Friday*.

WAR-DECORATIONS.

The Victoria Medal, given by our gracious Queen to the distinguished *braves* of the French army, seems to have inspired no less gratitude and enthusiasm than the crosses and medals so liberally bestowed by Napoleon I. We read that the ribbons by which they are suspended have begun to get shabby, but the present emperor has graciously given orders that the wearers shall be supplied with fresh ones at the public expense every three months. This reminds us of a more eccentric thoughtfulness of the kind on the part of his great predecessor. It was in the year 1809, after the victory of Ebersberg, between Linz and Vienna, that the emperor took up his quarters in a cottage, half destroyed by fire; and a private soldier, named Jean Coluche, was posted as sentry at the door, in company with a soldier of the Imperial Guard, with strict orders to allow no one to go in or out, unless accompanied by a staff-officer. About dusk, a figure enveloped in a gray overcoat quitted the ruined cottage. 'You can't pass here,' cried Coluche. Wrapped in thought, and with his arms folded, Napoleon, for it was he, continued to walk on towards the sentry. Coluche at once brought his musket to the charge, and cried out: 'You can't pass: not if you were the Little Corporal himself. Another step, and my bayonet is in your breast!' At the noise of this challenge, the generals and staff-officers came up; Napoleon re-entered the house; and poor Coluche was carried off to the guard-house. 'All up with you, my boy!' said his comrades; 'you have insulted the emperor, and they'll make an example of you, depend upon it.' 'Wait a bit—wait a bit,' replied Coluche; 'wasn't it my orders? I'll explain all that before the court-martial.' Without delay he was summoned to the presence of the emperor. He entered, and saluted with his hand to his cap. 'Grenadier,' said Napoleon, 'you may henceforward wear the red ribbon at your button-hole: I give you the cross of the legion of honour.' 'Thanks, emperor,' replied Coluche; 'but there are no shops in this country to buy the ribbon.' 'Never mind,' said the emperor; 'take a piece of stuff out of the first red petticoat you meet: that will answer the purpose.'

THE SWEET-SEDGE.

BY THE LATE MAJOR CALDER CAMPBELL.*

[In former days, the sweet-sedge (*Acorus calamus*) was used the garlands hung in churches or dwellings. From time immemorial, it has been used for strewing the floors of the cathedrals of Norwich, and been thrown on some of the adjoining streets the day of choosing the mayor of that city. When trodden its fragrance becomes stronger, and the old cathedral seems to be with incense.]—ANNE PRATT'S *Plants of Great Britain*.]

Oh, river-side,
Where soft green rushes bear dark flowers,
And reedy grasses weave dark bowers,
Through which fleet minnows glide—
Oh, river-banks, let me from you convey
Something to scatter in yon ancient minster gray.

Oh, minster gray!
Where graves of friends beloved are found,
I come to thee with strewments.—Round
Each blade of grass, each spray
Of *Acorus*, a fragrant essence breathes,
Nature's own incense shed to sanctify these wreaths.

Oh, rushes green,
With blossoms wan or brown!—and ye
Sweet flags, from whose scent-roots to me
Come thoughts of the Has Been,
Ye are the fitting plants at eve to shed
A vague mysterious perfume o'er the silent dead.

'Not so!—not so!'
A voice replies: 'For joy alone
These reeds and rushes here are strewn.'
But I again cry: 'Lo!
Joy's emblems here I fitly use, to prove
That life and death alike spring from God's holy love.'

HOW TO IMPART ODOUR TO FLOWERS.

Every day, man is extending his empire over external nature. Flowers, more especially, spring at his bidding into forms and colours so much richer and more beautiful than the original type, that he might almost boast them his own. He has now gone a step further: he has acquired the art of imparting odour to the most scentless flowers, by constraining those beautiful things to delight the sense of smell as well as sight.* A florist of Aricia, as we are informed by the *Emporio Italiano*, has made some successful experiments of this kind in heaping the roots of flowers an odoriferous compost, and producing the required scent. By means, for instance, of decoction of roses, he has given to the rhododendron the perfect odour of the rose. 'To insure success, however, the seeds themselves of the plant to which it is desired to impart fragrance should be acted upon. Let them be immersed for two or three days in any essence that will be preferred, and then thoroughly dry them in the sun, and shortly after sow them. This operation is to be repeated to those plants which have none whatever. If it is required to substitute one scent for another in the plant, it is necessary to double or triple the quantity of the essence; and besides preparing the seed, it is well to modify the nutritive substance. In order to retain the perfume, it will be necessary to repeat moistening with the odorous substance several days in the spring-season, for two or three consecutive days. Fragrance may be given at the will of the horticulturist, to any plant or tree, by boring a hole from one side of the stem to the other, or through the roots, and introducing the odoriferous ingredients into the hole.'

* The sudden and untimely death of this amiable and accomplished man will spread much grief throughout a wide circle of friends and the good.'

Price 1½d.

THE BEARDS OF OUR FATHERS.

ONE of the conventional semi-slang phrases of the day, not long since stereotyped upon our ductile language by the powerful agency of the diurnal press, is contained in the words, 'a great fact.' If we recollect rightly, it was first used by the *Times*, a few years ago, when that colossal paper condescended to recognise the existence, and rapidly increasing influence, of an important political movement. Destined to cruise in the pleasant waters of polite literature, this happy Journal ever avoids the boisterous billows of political partisanship; yet even in these pages another 'great fact' may be noticed; and though it has not organised a powerful league, raised large sums of money, published reams of tracts, nor spouted from a thousand platforms, still its existence—whether for an age or for all time, for weal or wo, for encomium or ridicule—cannot possibly be denied. So obvious, indeed, is this 'great fact,' so portentous are its accompaniments, that even who runs may observe it. Without opening a book, without unfolding a newspaper, without a word being spoken, we may distinctly recognise its unmistakable expression on the faces of our fellow-men, be they where they may. In court or camp, church or council-chamber, market or mansion, parliament or pot-house, street or station, stage-coach or steam-boat—everywhere, in short, we are daily bearded by this novel, synagogical sign of the times. Still, it is perfectly intrusive, the very remarkable circumstance being wholly true, that however gentish and impudent its followers may previously have been, their bitterest enemies cannot now term them barefaced. Need we say more! The important feature, the head question, countenanced by so many, agitates the face of society at the present day is our 'great fact'—the beard-movement.

Now, we are not going, neither do we consider it our province, to enter into the disputed case of beard or no razor—whether a man should, in Shakspeare's words, be 'bearded like the pard,' or

Fresh as a bridegroom, and his chin, new reaped,
Show like a stubble-land at harvest-home.

Now, our principal aim is to give some account of the beards of our fathers, for the benefit of the would-be beard-wearers of the rising generation; to endeavour to impress upon their minds a strong sense of that self-respect towards themselves, and courtesy to others, which the high and honourable antiquity of the beard, in the grave, dignified, and learned associations connected with it, so forcibly suggest. Nay, more; we even point out the different modes of wearing

that natural ornament of the face which prevailed among our ancestors, for the information, not only of the beard-wearers, but also of the barbers—we beg pardon, gentlemen—hair-dressers, we should say, of the present time. What, indeed, do the latter know about trimming a beard, except to cut it smooth off with a razor! All the beards we have met with, since the movement has commenced, are of the same stamp and pattern, without the slightest approach to originality or expression. Certes, we might as well ask a bombardier of the horse-artillery to handle a catapult, or a drill-sergeant of the Coldstream Guards to 'clap i' the clout at twelve score and carry a fore-hand shaft a fourteen and a half,' like that famous archer old Double, whom John of Gaunt loved so well, and of whom Justice Shallow prated so garrulously—as ask a tonsor of the present day to trim a beard in the Roman *T*, pique devant, spade, or any other of the various styles our ancestors so tastefully delighted in.

Morgan, the quaint, old heraldic writer, in his *Sphere of Gentry*, and in all seriousness too, informs us that Adam was the first gentleman who introduced fur, or, as it is technically termed, *vair*, into heraldry, he having adopted a sur-coat made of the hairy skins of beasts, after his marriage with Eve, whose arms he bore as an *escotcheon of pretence*, she being an heiress. Now, as the wearers of skin seldom shave so closely as the wearers of broadcloth, we may assume that Adam wore his beard. This opinion is strengthened by a remark of the English Josephus—no great authority, however—who, when speaking of the form of Adam's beard, says he must have worn it long; that is, a long time, before Tubal Cain had made a razor wherewith to shave it. It may be as well, however, to leave the antediluvians to themselves. Aaron, we learn, wore a forked beard, which was anointed with butter, like the head of Mr Mansfield Parkyns, the Abyssinian Brummel. The Theban Ammon-ra wore a narrow elongated beard, as Egyptian monuments testify; and the indomitable energy of Layard has made evident to us, as a nation of shopkeepers, the extraordinary demand for curling-tongs which must have existed among the ancient Assyrians, from the elaborate manner in which they dressed their beards. In short, from the earliest antiquity, the beard has been highly esteemed as an emblem of dignity and wisdom.

Homer, in terms of the warmest admiration, speaks of the snow-white beards of Priam and Nestor. Virgil, with all the ardour of a poet, descants on the flowing beard which covered the breast of Mezentius. Pliny, the Younger, seems to take a pleasure in relating how the flaxen beard of Euphrates, the Syrian philosopher,

inspired his fellow-countrymen with the most respectful veneration. Persius, convinced that the beard was the symbol of all wisdom and knowledge, considered that he could not bestow a higher encomium on Socrates than terming him *magistrum barbatum*—the bearded master.

When Louis XIII. ascended the throne of France, a mere lad, the supple courtiers shaved off their beards in compliment to the youthful king. But shortly afterwards, circumstances of danger and difficulty arising, the court was compelled to solicit the assistance and advice of the distinguished soldier and statesman, Sully. The brave old warrior disdaining to conform to what he considered an effeminate custom, wore a beard of magnificent dimensions, and was consequently a conspicuous object among the close-cropped courtiers, who greeted his unfashionable appearance with sneers and contemptuous laughter. Sully, unabashed by such demonstrations, advanced to the king, and said: 'Sire, when your father, of glorious memory, did me the honour to consult me on grave affairs of state, he first dismissed the buffoons and stage-dancers from the presence-chamber.'

The succession of the boy-king, Philip V., to the crown of Spain, had an exactly similar effect upon the beard; but, as a proof of the estimation in which it was held, its suppression gave rise to a well-known Spanish proverb, 'Desde que no hay barba, no hay mas alma'—(Since we have lost our beards, we have also lost our souls.)

Even among the lowest classes, the beard was formerly considered to be the symbol of wisdom and command. In Beaumont and Fletcher's comedy, *The Beggar's Bush*—or Fletcher's rather, for it was written after Beaumont's death, and acted, for the first time, before the court in 1622—when Oswin, a stranger, has, at the beggars' request, chosen the one who had the longest beard to be their king, Higgen, the beggar-ordinator, thus addresses the new-made monarch:

But what need presage
To us, that might have read it in thy beard,
As well as he that chose thee? By that beard,
Thou wert found out and marked for sovereignty.
Oh happy beard! but happier prince whose beard
Was so remarked, as marked out our prince,
Not bating us a hair.

The most sacred oath of the Mohammedan is, 'by the beard of the Prophet; and when a 'turbaned Turk' suspects that any one is trying to humbug him, the expressive inquiry, 'Do you mean to laugh at my beard?' is tantamount to the Englishman's, 'Do you see anything green about me?' This is also the signification of the old phrase, 'making a beard,' we find in Chaucer. In the reeve's tale, the miller says:

I trow the clerks were afeared,
Yet can a miller make a clerk's beard,
For all his art.

In the olden time, when an inferior was addressing a person of higher rank, or when a person was soliciting a favour, it was always the custom to stroke the beard downwards, as a token of inferiority, deference, or entreaty. Butler, who seems to have never missed the slightest shade of manner or character, represents Hudibras making submissive congees to the widow:

And all due ceremonies paid,
He stroked his beard, and thus he said.

This observance is as ancient as Homer: we read in the tenth book of the *Iliad*, when Dolon is earnestly supplicating Diomedes for mercy:

Sternly he spoke, and as the wretch prepared,
With humble blandishment, to stroke his beard,
Like lightning swift, the wrathful falchion flew.

The custom is also alluded to in that most amusing

episode in *Don Quixote*, where the fictitious Trifaldin, of the white beard, squire to the equally fictitious, disconsolate matron, implores assistance from the knight of the woful countenance. 'He coughed,' says the author, 'and stroked his unwieldy beard from top to bottom with both hands.'

How much more graceful a gesture this is, than the ridiculous and unmeaning mock-hand-washing manœuvre, so regularly performed by tavern-waiters and walking-gentlemen! Even our tragedians overlook this graceful, natural expression of submission, and deferential appeal, though they have the high authority of Shakspeare for it. In *Troilus and Cressida*, Ulysses describes Patroclus mimicking the Grecian warriors for the amusement of Achilles, and the latter saying:

Now play me Nestor—hem and stroke thy beard,
As he, being dressed to some oration.

Probably this gesture arose from the beard being frequently consecrated, as a most precious offering, to the heathen deities. Chaucer, in the knight's tale, describes Arcite as offering his beard to Mars, in the following words:

And evermore until the day I die,
Eternal fire I will before thee find:
And eke to this avow, I will me bind,
My beard, my hair that hangeth long adown,
That never yet felt no offension
Of razor nor of shears, I will thee give,
And be thy true servant while I live.

Our Saxon ancestors delighted in wearing long forked beards; the Normans, on the contrary, at the period of the Conquest, not only shaved their chin but also the back parts of their heads. They had not, however, been long established in England before they permitted their beards to grow to extraordinary dimensions. The long beards, painted hoods, and gowns of the English were thus satirised by the Scottish visitors to London in the reign of Richard I.

Long beards heartless,
Painted hoods witless,
Gray coats graceless,
Make England thriftless.

From the time of Henry IV., the beard began to decrease in size and popularity; and growing less by degrees and beautifully less during the long and disastrous commotions of the Wars of the Roses, became almost extinct, until it was once more called into existence by the Reformation. Yes, dear reader, by the Reformation. Small events may arise from great causes, as well as great events from small causes; and thus it was how that ever-memorable occurrence affected the beard.

After the separation of the Greek and Latin Churches, the practice of shaving became a religious duty among the Roman ecclesiastics, by way of distinction to the Greeks, who, to this day, have continued to pay reverence to a well-clad chin, and are greatly shocked by the beardless images of saints in the Latin churches. The shaving of the chin by the clergy was imperatively commanded by various statutes in the Romish Church; and so strictly were these statutes adhered to, that Duprat, Bishop of Clermont, desirous to break them, found one Easter-Sunday morning the doors of his own cathedral shut in his face. But the dignitaries of the chapter were awaiting him in the porch, one holding a razor, another a pair of scissors, and the third an open book, containing the statutes of the church, with his finger pointing to the words *circumcisis*. In vain did the bishop urge the sanctity of shaving on so holy a day; he was not listened to. Prevented from entering the cathedral, he returned home with his beard, and in a short time died of a broken heart.

By the monastic laws, the lay-monks were commanded to let their beards grow, and only the priests to shave; and a writer, previous to the Reformation, complains that the manners of the clergy had become so corrupt, that they could not be distinguished from the laity by their actions, but only by their want of beards. Consequently, the early reformers suffered their beards to grow, to distinguish themselves from the adherents to Rome; and the Reformation becoming general in England, the beard by this means came into fashion among the clergy.

Verheiden's portraits of the Reformation afford us some good specimens of beards. Beza wore his long and forked; Calvin's was long and pointed, with a slight waving curl; Fox and Cranmer wore goodly appendages to their chins; but John Knox eclipsed all his contemporaries, his beard flowing down to his girdle. These reverend fathers did not wish to concede the use of the beard to the laity, considering that it should be the distinguishing feature of the ecclesiastic alone.

The archaeological inquirers of a future era, thanks to the still-increasing triumphs of the graver's art, will have an easy task when tracing the modes and costumes of our days. A few copies of *Punch* or the *Illustrated News* preserved from oblivion, will make the all-round collar and the alpaca poncho, the wide-awake hat and the Wellington boot, the palétot and the Paxton, almost as familiar to our descendants as those brilliant triumphs of æsthetic invention are to ourselves. We, however, when looking back among the dim shadows of antiquity, have no such advantage; in the earlier periods of our history, we are able to trace the form of the beard only in hideous pre-Raphaelitish figures, worked on tawdry threadbare tapestry, or on the sculptured stones and brasses that so faithfully represent the living forms of the dead, whose memory they were erected. From the reign of Elizabeth, however, the dawning of the modern drama, as the dramatic writers, those brief chroniclers of the times, hold their mirrors up to nature, we are enabled to glean a few reflections; and the satirists, too, when vigorously lashing, afford us many glimpses of the fashions and follies of their era. Holinshed, writing about the middle of the sixteenth century, says:

'Neither will I meddle with our variety of beards, of which some are shaven from the chin, like those of the Turks, not a few cut short like to the beard of Marquis Otto; some made round, like a rubbing-brush; other with a pique devant (Oh, fine fashion!), or now and then suffered to grow long; and the barbers being known to be so cunning in this behalf as the tailors. Therefore, if a man have a lean and straight face, a Marquis of Otto's cut will make it broad and large; if it be platter-like, a long slender beard will make it seem the narrower; if he be weasel-beaked, then such hair left on the cheeks will make the owner look like a bowdled hen, and so grim as a goose, if Cornelius Chelmerford say true; many old men wear no beards at all.'

'Without presuming to insinuate in the slightest degree that any of the supporters of the present beard-arrangement are 'weasel-beaked,' or that any amount of hair on the face would make any of them look 'so platter as a goose,' we would earnestly solicit their attention to the fact, thus alluded to by Holinshed, that our ancestors cut their beards according to the shape of their faces; and that they, if they wish to wear their beards to the adornment of their persons, must undoubtedly do the same.

The Lyly's *Midas*, published in 1591, we find one barber, thus addressing his apprentice: 'Besides, I instructed thee in the phrases of our frequent occupation, as—How, sir, will you be shaved? Will you have your beard like a spade or

a bodkin? a penthouse on your upper lip, or an alley on your chin? your mustaches sharp at the end, like shoemaker's awls, or hanging down to your mouth like goat's flakes?'

The spade-beard, in form like the iron part of a spade, was that mostly worn by soldiers. At a period when almost all men wore swords, and those weapons were frequently drawn to decide very trifling quarrels—in an age, we may say, of 'difficulties,' as our transatlantic brethren mildly term combats *à l'outrance*, a beard cut to look terrible to an enemy was probably no small advantage to the wearer. Shirley, however, in *A Contention for Honour and Riches*, written about 1630, shews that the terrible beard had not always a terrific effect:

Soldier. You have worn a sword thus long to shew the hilt,

Now let the blade appear.

Courtier. Good Captain Voice,

I shall, and teach you manners; I have yet

No ague; I can look upon your buff

And punto beard, and call for no strong waters.

The spade-beard, however, was not always the distinguishing mark of a soldier: the unfortunate Earl of Essex wore a spade; but his friend Lord Southampton, the patron of Shakespeare, who passed a great part of his life in camps, wore the long slender tuft of hair, diminishing to a point, termed the stiletto-beard. But the fashions of beards, like everything else, were always changing. One of the characters in Middleton's *Time's Metamorphosis*, exclaims to another:

Why dost thou wear this beard?

'Tis clean gone out of fashion.

It is highly probable that the officers and private soldiers of an army wore their beards as their general did his. In *King Henry V.*, Gower, when enlightening Fluellen as to the true character of the cowardly braggart Pistol, says: 'And what a beard of the general's cut, and a horrid suit of the camp will do among foaming bottles and ale-washed wits, is marvellous to be thought on; but you must learn to know such slanders of the age.'

The almost endless variety of beards that were fashionable in the reign of Charles I., have been sung by Taylor in the *Superbia Flagellum*, though, curiously enough, he does not mention the kind of beard he himself wore. It was a corkscrew-beard, a single tuft of hair, hanging down from the centre of the chin, and twisted into a spiral form. Taylor's description of beards occupies some pages; we shall quote only the close of it:

Some like a spade, some like a fork, some square,
Some round, some mowed like stubble, some stark bare,
Some sharp stiletto fashion, dagger-like,
That may, with whispering, a man's eyes outpike;
Some with the hammer-cut or Roman T,
Their beards extravagant reformed must be;
Some in the quadrate, some triangle fashion;
Some circular, some oval in translation;
Some perpendicular in longitude;
Some like a thicket for their crassitude;
That heights, depths, breadths, triforms, square, oval,
round,

And rules geometrical in beards are found.

The Roman T or hammer-cut beard was a plain tuft down the centre of the chin, the mustaches parted straight out on each side to form the cross, or upper part of the T. The beard worn by the present emperor of France is an exact Roman T, as may be verified by many old portraits. It was all the vogue in the time of Charles I., as we learn from the *Queen of Corinth*:

He strokes his beard,

Which now he puts i' the posture of a T,

The Roman T; your T-beard is the fashion.

A beard somewhat resembling the spade form, but of an equal breadth throughout its length, was known as the tile-beard—a term still more appropriate when it was of a reddish colour. Thus we read in *Hudibras*:

His tawny beard was th' equal grace
Both of his wisdom and his face,
In cut and dye so like a tile,
A sudden view it would beguile.

A tile-coloured beard, however fashionable or unfashionable its shape might have been, was not by any means considered a blemish in the olden time. The exquisites of that period used to dye their dark hair and beards a light colour, as some now-a-days dye their light hair dark. In the old books of recipes or 'secrets,' as they are termed, we never meet with the modern friseur's motto, 'No more gray hairs;' on the contrary, we are told how to change black hair to gray, white, yellow, red, and even green. In the seventeenth century, the Jewish females in Holland and Flanders used to cut off their fine black hair, and wear yellow wigs instead. So much for the caprices of fashion.

We think it our duty, however, to warn the youthful reader that the ladies, even in the olden time, did not always admire the beard, especially when it was accompanied by the fumes of tobacco-smoke. A conversation similar to the following might very readily take place at the present day, though we actually extract it from Marston's *Antonio and Melida*, a comedy first acted in 1662:

Piero. Faith, mad niece, I wonder when thou wilt marry.

Rosaline. Faith, kind uncle, when men forsake taking of tobacco, and cease to wear their beards so rudely long. Oh! to have a husband with a mouth continually smoking, with a bush of furze on the ridge of his chin, ready still to flop into his foaming chops; ah! 'tis more than most intolerable.

The beard, too, was on some occasions, and might be still, a tell-tale. Ralph Kettle, preaching in St Mary's Church at Oxford, at the conclusion of his sermon said: 'But now I see it is time for me to shut up my book, for I see the doctor's men come in, wiping their beards from the ale-house.' 'He could,' says Aubrey the antiquary, 'plainly see them, and 'twas their custom to go there, and about the end of the sermon to return to wait on their masters.'

Even in its high and palmy days, the beard, when too large, was not unfrequently a subject of ridicule. In Lyly's *Midas*, we read of

A dozen of beards
To stuff two dozen of cushions.

And in the same play, another character says:

All my mistress's lines that she dries her clothes on are made of moustachio stuff.

Again, Menenius, in *Coriolanus*, tells the tribunes that their 'beards deserve not so honourable a grave as to stuff a butcher's cushion, or to be entombed in an ass's pack-saddle.'

In Charles II.'s time, the beard became smaller and smaller, till at last a new style of decorating the head put it entirely out of fashion: this was the detestable monstrosity termed a periwig, worn in servile imitation of the French courtiers, who wore it in servile adulation of Louis XIV. The Grand Monarque, it appears, when a boy, had a remarkably beautiful head of hair, which hung down in long waving curls upon his shoulders; and the courtiers, out of compliment to their young sovereign, had wigs made to imitate his natural locks, which obtained the name of perukes. The base subservieney of the English to the French court at that period, placed this absurd head-dress on the shoulders of English gentlemen, and the common

people contemptuously termed it a periwig—a name which had previously been given to a theatrical character-wig, worn, as Hamlet says, 'by a robustious periwig-pated fellow.'

So late as the first half of the last century, some of the clergy continued to wear the beard. Clubbea, in his *Free Advice to a Young Clergyman*, written about that period, recommends him 'not to come into that Jewish fashion of wearing a beard round his face; in them [the Jews] it may be proper enough, but, with us, openness of countenance is the characteristic of an ingenuous mind.'

The periwig, after extinguishing the beard, fell into the oblivion it so well merited. Custom, tyrannical custom, still inflicts it on the heads of lawyers, its last refuge. The beard, aided perhaps more than is generally considered, by the loosely fitting forms of our present garments, seems likely to regain some of its ancient importance. But, alas! the black, inconvenient cylinder, termed a hat, still tortures our weary heads. Assuredly, a majority of the adult male population of England would accept the beard, ay, and dye it green too, if inexorable fashion required it, on condition that a new and easily worn hat were introduced at the same time.

SKY-HIEROGLYPHICS.

WHEN the remote regions of space are reconnoitred by the help of very powerful telescopes, miniature star-systems are discerned scattered about there, some looking only like minute specks of faint cloud, on account of the collective light of their twinkling host being paled down, almost to disappearance, by extreme distance; but others having distinct star-points dotted and stippled in upon their faces in various ways, so that they assume individual and characteristic forms, which can be at once recognised whenever they are encountered by astronomers.

Among these more individualised star-systems of the remote firmament, there are some twelve or fourteen which possess an especial interest on account of the intelligence which beams forth from their features. A family likeness pervades all the members of this group, the fundamental idea of the physiognomy being a spirally contorted arrangement of light streaks, with scintillating balls concentrated in the midst, and depending from the outer extremities of the spires. They all look very much as if they might have been whirling fireworks, whose sparks were suddenly, and as they flew, fixed into indelible fire-petrifications. Some of these star-scrolls are viewed in full face, with all their convolutions open, like the partitions of the nautilus-shell seen in section and edgeways; others are contemplated three-quarters full, and others in profile, with the scrolls setting away from the observer. Science is indebted to the skill and perseverance of Lord Rosse for its knowledge of these strange objects. It was the noble instruments of this illustrious observer that first brought into view these star-shells of the celestial deep.

In these spiral star-systems, the scrolled or convoluted arrangement is so obvious and complete, that there can be no doubt of the peculiar figure expressing the dominant operation of some special power. The spires of these starry miniatures as much declare the active influence of some scrolling agency, as the whorls of the Catharine-wheel intimate that the body which emits the sparks is in rapid revolution. Hence the discovery of the scrolled nebulae by Lord Rosse was very soon followed by speculations, on the part of inquisitive philosophy, concerning the forces that were probably at the bottom of the scrolling. Scientists are now pressing with great urgency the question, 'What can the meaning be that is hidden within these hieroglyphical inscriptions of the sky?' What can

the proceedings of nature that are recorded by these curled and contorted characters?

The sails of a wind-mill go round because their sloping vanes are pressed laterally as the breeze sweeps along past them. But now, let it be conceived, for the sake of illustration, that the tables for once are turned upon the wind; let it be imagined that the sails are whirled round by means of machinery acting upon the central shaft within, just as the blades of the screw are whirled round by the shaft, at the stern of the screw steam-ship. Then they would be resisted by the wind, as they turned, and would have to drive currents of it out of their way, as the blades of the steam-screw drive backwards currents of water by their revolution. The sails of the wind-mill would, on this supposition, succeed in dashing the air out of their way, principally because their framework was made of strong unbending timber. But if it were formed of yielding whalebone, or India-rubber, instead of being composed of rigid timber, how would the case then stand? The elastic ribs of the sails would give way, to a certain extent, before the resistance they experienced, and would curve before it, as the whalebone frame of an umbrella curves before a violent blast of wind. The rotating mill-sails, if viewed from a distance, would then cease to look like a revolving cross, as mill-sails ordinarily do in the face of the landscape, and would assume instead the appearance of convoluted spires turning upon their centres. They would, in fact, wear the same general aspect as the scrolled nebulae or star-systems brought to light by the researches of Lord Rosse. This, then, is what many natural philosophers are inclined to hold that these convoluted objects are. They believe them to be revolving sails, whose skeletons and ribs are of yielding consistence, instead of being composed of rigid material; so that the radiating arms get bent into spiral curves when they are whirled round in the midst of a resisting force that serves to oppose their movement.

An apparent difficulty presents itself upon the threshold of this explanation, which seems at the first glance to affect its principles in an unfavourable way: the revolving sails of a wind-mill can be seen going round; their movements can be traced by the eye; but no motion can be detected in the star-scrolls; none of them have yet perceptibly changed the positions of their spirally curved arms since the period when they first came under observation. They are not seen to be going round. Upon further consideration, however, this obstacle complaisantly withdraws itself out of the way. When an observer stands near to a wind-mill, the ends of the revolving sails rush past him with terrific impetuosity and speed; but if he then moves off gradually from the mill, he will observe that the sails appear to turn more and more gently, although, in fact, the velocity of their movement is in no way altered. Under this experience, the notion is soon realised, that it is altogether possible for such a thing to exist as mill-sails so vast, that although their extremities are rushing along with a speed of almost inconceivable amount, they may nevertheless be contemplated from a distance at which the revolutionary progress ceases to be perceptible during any interval of time that can be employed in observation. If the star-scrolls be revolving spiral sails, it is obvious that they really must stand in this precise category. It is known that their stupendous forms extend through distances light could not flash across in thousands of years, although it passes round the earth six times in a second; and that, consequently, if the outer extremities of their spires were sweeping onwards with a velocity many times greater than that with which the iron ball flies from the mouth of the cannon, that velocity would nevertheless be altogether inappreciable to observers watching it from minute

to minute, and from day to day. So enormous must the circles be through which those celestial mill-sails wheel, that they can only be completed in intervals of thousands upon thousands of years, whatever may be the speed of the movement. In such a state of affairs, it is manifest that short-lived man must watch in vain for any indication of the mighty progress. Its almost infinite march must, of necessity, altogether elude the finite sense that endures but for a few short years.

Having summarily disposed, then, of this weighty difficulty, three other very important considerations next arise: What is the nature of the movement wherewith these gigantic firmamental mill-sails are wheeled round? what is the character of the resistance that curves their huge arms? and what is the composition of these arms, that they are strong enough to hold together, and yet pliable enough to bend to the pressure? We want to know, what are those firmamental mill-sails made of? why are they spirally bent? and why do they whirl?

The most direct road to the solution of these queries lies nearer home than the far-off regions in which the strange objects themselves are placed. Bring back your attention, for a brief interval, to the earth—What is that body? It is both very large and very heavy. Take a million of tons of some solid substance, like iron ore—that is, as many tons as it would require eleven days and a half to count, if one ton were reckoned off every second—place them all in a heap; then make a million such heaps, and lump them all together as a billion of tons. Next form as many billion heaps as there are individual tons in the lump, add one quarter as much again, and roll up the whole into a ball. There you will have the earth, so far as massiveness is concerned. The terrestrial sphere weighs a billion and a quarter of billions of tons!

But how is this ponderous ball sustained in space? Where is the pillar upon which its enormous bulk is laid? or where are the chains by which it is suspended? Go round the earth from east to west, and from north to south, and you will see nowhere any material support. All is transparency and void, until the eye reaches the far-removed orbs which gleam in the remote firmament. The earth is an island of matter, in the ocean of immensity, with only waves of impalpable and incoherent ether breaking upon its shores.

As might be anticipated, then, since this ponderous sphere is not supported in space, it is falling through it, sweeping along onwards, and still onwards, for ever, with fearful impetuosity. The speed of its movement is sixty-eight times as great as that of a ball shot from a rifle; ninety times as great as the velocity of sound; and *eleven thousand times* as great as the speed of the express railway-train! The earth performs a surprising journey of nearly sixty-eight thousand miles every hour.

But whither is the earth falling? To what point does its rapid movement tend? Its own inherent tendency of movement is towards the next very large substantial body that lies out in space as its next-door neighbour. It endeavours to fall to that neighbouring body, as a small stone strives always to fall to it, when raised away from the terrestrial surface. It has been arranged by the Creative fiat which established the order of nature, that all heavy bodies shall act as magnets towards each other. Each one draws, and is drawn by, all the rest. If a series of heavy bodies, like the earth, were simultaneously set down in different situations in space, and then were abandoned there, free from external control, they would all immediately rush together under the influence of this magnet-like attraction.

The nearest very large substantial body that lies out in space, as a next-door neighbour to the earth, is

the sun. This neighbour is a very large sphere indeed; it has in itself a bulk that is equal to a million and a half of earths, and it consequently plays the part of a proportionally powerful magnet to its terrestrial companion. If the earth were abandoned to the influence of this mighty magnet, it would of necessity be drawn to the sun, and would find itself held fast there after a few hours' rapid flight. It is not, however, abandoned to the solar attraction, for it was primevally thrown into space, so to speak, and not set down there; and it was thrown in such a direction that its own momental impulse carried it, not *towards* the sun, but *across* the direction in which the sun forthwith began to pull it. The consequence was, that it went on moving, neither in the line in which it was launched by the Creative hand, nor yet in the direction along which the sun pulled it, but in a course that was intermediate to, or compounded of both. This, then, is how the ponderous earth is sustained without material upholding. It is sustained by the combined influence of movement and attraction. It is rushing along with the momental force with which its vast mass was originally launched into space; but as it is doing so, it is caught in the strings of the sun's attractive energy, and is made to whirl round the sun, as a stone is caused to whirl round the head of a slinger, by the strings of the sling. The earth's onward momental movement is diverted into a whirl round the sun by the solar attraction. The ponderous earth is falling *round the sun in a circle*, or, more correctly speaking, in an ellipse, that for ever returns very nearly into itself.

But upon what is the yet more ponderous sun pillared or hung in its turn? The sun, too, hangs upon nothing. It is falling through space. With its dependent earth, it is rushing along for ever with a speed sufficient to carry it through the vast distance of one hundred and fifty-four millions of miles in the course of a year. As, however, it is doing so, it, too, is caught in the strings of attraction, and is made to whirl round, instead of flying onward. It is whirling round large orbs like to itself, which, nevertheless, on account of extreme remoteness, look to human eyes only like twinkling stars.

What is true in regard to the earth and the sun, is also true of the other material members of the universe. All the bright stars are wheeling through space, rushing onwards with the momenta primarily impressed upon their several masses, but gracefully bending round each other as they do so, under the influence of mutual attraction. The stellar orbs are sustained in space in precisely the same way as the earth and the sun: motion and attraction uphold them as securely as if they were hung in material chains. The twinkling stars which are scattered so confusedly in the nocturnal firmament, are all connected into a system by the meshes of mutual attraction, but are continually keeping the threads of those meshes stretched by their gyratory energies. They cannot fly asunder, because each is restrained by the magnet-like hold of its neighbours; they cannot rush together, because each is impelled by innate impulse of great power another way: consequently, they all sweep round and round, like drops in a mighty whirlpool. If some superhuman intelligence, freed from the restrictions of space and time, could rest on the far shore of the immensity, and look back, in sustained contemplation, upon the twinkling brotherhood, it would see this star-whirlpool dimpling the even face of the firmament, as man sees the watery eddies dimpling the smooth face of the mill-pool.

Even so when the astronomer, aided by the telescope, looks out into surrounding space, he sees dimples on the face of the firmament, caused by eddies of stars. He has not time, it is true, to follow the movement, but he sees the fact of the movement in the form of

the eddy. Those spiral scrolls discovered by Lord Rosse are eddies of stars caught in the act of gyration. The elastic and flexible connection that holds together the spiral arms, is the magnet-like attraction of star for star; the resistance that curves the arms into spires, is the preponderance of the magnet-like attraction in the direction in which most stars are concentrated at the time; and the movement which produces the whirl, is the impulse communicated to the stars by the hand of the Creator. The stars in the distant and external systems, detected beyond the utmost bounds of the earth's more immediate star-group, are sustained in space by precisely the same agency as those nearer bodies.

Such is the interpretation the Daniels of science now offer as the correct reading of these scroll-hieroglyphics. They tell us that, in those spiral nebulae, stars are seen, hanging in clusters upon each other, like bees in a swarm, yet kept from actual contact by the rapidity with which they are eddying. Streaks and knobs of superior brilliancy appear wherever the whirling stars set in more closely together for the time. In the rich depths of the universe there are, in all probability, star-systems of every degree of diversity. In some, for instance, the several orbs are sweeping in concentric ellipses round a common focus, as the planets roll in concentric orbits around the sun; in others, the stars are rushing along in every direction, layer over layer, spherically arranged, as shell beyond shell; and in yet others, subordinate dimples are circling in more comprehensive revolutions, just as the satellites are whirling about the planets, and the planets about the sun.

But it by no means follows that any of these star-systems are of fixed and unalterable character; it is far more accordant with the plan of cyclical progress, which seems to be of such general prevalence in the universe, that the condition present in either of them at any one time is but a single figure in a mazy dance that passes on through a long series of changes, at length to return again and again upon itself, exactly as each varied configuration of the planets and satellites is renewed after prolonged periods. These spiral scrolls, indeed, look to the eye as if they were unrolling their star-streams. Possibly, myriads of centuries hence, they will have expanded themselves into hollow rings; and then, after yet other myriads of centuries, will be found reconcondensed into compact spherical clusters, in their turn once more to unroll into spires. It is a very remarkable fact, that hollowing star-systems, and spherically compacted systems, are discerned in the firmament, just as if different members of the same organisation were exhibited to the eye in the successive stages of their progressive change, to compensate for man's inability to trace out the progress of the change in any individual case.

SCHOOLS CHEAP AND NASTY.

The schoolmaster is a rising man in our age. It may be safely said that, in income and in social consideration, he is at twice the height he was in the early years of this century. Yet the *Times* continues to inform us of instances in which the expectations of this functionary appear quite as low as ever, if they are not indeed lower. Take the following example, selected from a late number:

Education sixteen guineas per annum.—A lady having a highly respectable establishment, offers to receive a few young ladies on these reduced terms, including Music, Drawing, and French. House very large, with ample playground. School-room, 40 by 18 feet. Trained daughters taken in exchange. Unexceptionable references. Address with real name, &c.

In the next column we find a similar one, only young gentlemen are advertised for, and the terms are a little lower than in the above:

Education sixteen pounds per annum (no extras).—Parents of limited income and those having large families are invited to address the advertiser. The education embraces the Latin, Greek, French, and German languages, the Mathematics and English generally. The house is spacious, standing in its own beautiful and extensive pleasure-grounds. A liberal table is kept, and every domestic comfort may be depended on. References to parents of pupils now at the school.

In a third, taken from the same page, an offer is made to board, clothe, and educate young gentlemen for L.18 per annum; and numbers of others may be found even within the limits of the same paper, offering board and an education including numerous accomplishments, on terms varying from this sum to L.25 a year.

One can hardly think that Mr Dickens's Dotheboys Hall is an overdrawn picture, or that such establishments as the one kept by Mr Squeers have ceased to exist, when we read such advertisements as the above. The age in which we live, philanthropical as it may be, is not so overflowing with the commodity that a crowd of benevolent individuals are to be found willing and eager to educate the children of other people at the cost of their own pockets; and yet a little analysis will show that education on such terms cannot otherwise be given.

Let us calculate the cost of a pupil fed in the plainest manner, and at the least possible expense—but not actually dipping under the starving-point—for forty weeks out of the fifty-two, allowing the remaining twelve for vacations. Let us suppose this child to have three meals a day—a number parents have a predilection for as the minimum; and that the morning and evening repast cost sixpence *together*: these meals alone, for 280 days, will take L.7 out of the annual stipend. Dinner, with however small a quantity of animal food, could not be supplied for the same sum; but calculating it to cost a fraction above fourpence per day (including the luscious vehicle of the sulphur), L.6 more will be required; so that at least L.12 per annum must be expended in the actual cost of food. But it is not only food that has to be provided, but lodging. The veriest outcasts on the face of the earth pay threepence a night for bare shelter, with a couch of straw, not particularly clean. Allow but the same for the lodging of your child night and day, and L.3, 10s. more is expended out of the sixteen guineas named in the first advertisement. At this computation, which certainly does not admit of anything very luxurious either in food or accommodation, twenty-six shillings will remain to pay for the instruction of the young ladies for the year, including music, drawing, and French. In the second advertisement, in which pounds are mentioned instead of guineas, the sum of ten shillings per annum remains to pay for the education, 'which embraces Latin, Greek, French, and German; mathematics and English generally.' In the third, as clothing is offered, in addition to board, lodging, and education, for L.2 a year more, we may consider there is no very important difference in the terms.

But it is not only for what has been already mentioned that the head of an educational establishment must look for remuneration; in the first place, some capital is necessary to take and furnish a house large enough for scholastic purposes; and let the furniture be of the very plainest and most homely description that can be procured, it will still cost something. Of course, for this capital expended, interest must be looked for. Then there is the actual rent of a large

house and grounds—if the advertisement can be credited which describes them—the wages and food of servants, with other items almost innumerable. All this is positive outlay, independently of the educational part of the bargain. Supposing the master to be so admirable a Crichton as to be able to teach all the varied branches of learning himself, and the lady-principal so completely finished as to undertake the whole conduct of the school, accomplishments included, surely the time of such talented persons is worth a trifle. They should at least earn a living by exercising these powers; and not only that, but some little return might naturally be expected, by way of interest, for the sums spent in fitting them for the position they occupy. But as it can scarcely be thought that a single head, with the pair of hands which usually—not always—accompany it, will be able, unaided, to go through the whole work of a school, suppose an assistant to be employed. This does not always imply that the individual is paid; for, referring again to the columns of the *Times*, we find advertisements inserted by persons at least professing to be able to teach a great deal, and stating their willingness to do so without any other remuneration for their services than simply board and lodging, or, to use the prescriptive term, 'a comfortable home.' The teacher, however, even when receiving no salary whatever, must cost the principal at least as much as one of the pupils.

Now comes the question, how are all these expenses met? Sometimes we hear of additional items of various kinds inserted in the bills, which so swell their amount as to make the concern pay in spite of the apparent lowness of the charge; but in one of these advertisements we see the ominous words, 'no extras;' so we are driven from that idea in despair.

And yet some profit must be obtained out of the miserable pittances quoted, or why are such pupils thought not only worth having, but advertised for? Advertisements, it is true, are now pretty cheap; but being frequently, almost constantly, repeated by the philanthropical educators of juvenile England, they must cost a good deal in the aggregate.

That it is quite impossible for a teacher, in such circumstances, to fulfil his bargain honestly to himself and his employers, must be apparent. Yet I should almost blame more than the school-speculators, the parent who committed his child into such hands without making any calculation as to whether the other party in the bargain can be reasonably expected to fulfil his share of the contract. This, however, is often the last thing thought of; the main object being to have their children taken entirely off the parents' hands, and brought up with as little trouble and expense to themselves as possible. That there is a great demand for these cheap schools is evidenced by the number of advertisements, similar in class to those cited, which appear daily in the provincial papers as well as the *Times* and other metropolitan journals.

It would be amusing, were it not for the ideas of a different nature which are also suggested by them, to notice such sentences—as, for instance, this, from one of the advertisements given above: 'Parents of large families and of limited income are invited to address the advertiser;' and again, 'Tradesmen's daughters taken in exchange.' The family should indeed be large if a member is condemned to be educated and boarded on such terms. The remark as regards 'tradesmen's daughters' is, to say the least of it, a little ambiguous. Are they to be taken in exchange for the children of the school, the deficiency of the latter in flesh being made up for in learning? Or are the olive branches of the tradesman to be done for in payment of his account for the goods he deals in? If this is the true explanation—and we suspect it is so, notwithstanding the absurdity of the phrase 'children taken in exchange'—the advertisements are

doubtless meant exclusively for the dealers in adulterations and imitations, as articles of any quality whatever will fully remunerate the school for such board and education.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LXXXVII.—NO COVER.

In silence I continued to scrutinise the camp, but could discover no mode of approaching it secretly or in safety.

As I have said, the adjacent plain, for nearly a thousand yards' radius, was a smooth grass-covered prairie. Even the grass was short; it would scarcely have sheltered the smallest game, much less afford cover for the body of a man—much less for that of a horse.

I should willingly have crawled on hands and knees over the half-mile that separated us from the encampment; but that would have been of no service; I might just as well have walked erect. Erect or prostrate, I should be seen all the same by the occupants of the camp, or the guards of the horses. Even if I succeeded in effecting an entrance within the lines, what then? Even should I succeed in finding Isolina, what hope was there of our getting off?

There was no probability of our being able to leave the lines unseen—not the least. We should certainly be pursued, and what chance for us to escape? It was not probable we could run for a thousand yards with the hue and cry after us? No; we should be overtaken, recaptured, speared or tomahawked upon the spot!

The design I had formed was to bring my horse as close as possible to the Indian lines; to leave him under cover, and within such a distance as would make it possible to reach him by a run; then mounting with my betrothed in my arms, to gallop to my comrades. These I had intended should be placed in ambush, as near to the camp as the nature of the ground would permit.

But my preconceived plan was entirely frustrated by the peculiar situation of the Indian encampment. I had anticipated that there would be either trees, brushwood, or broken ground in its neighbourhood, under shelter of which we might approach. To my chagrin, there was none of the three. There was no timber nearer than the grove in which we were lying—the copse excepted—and to have reached this would have been to enter the camp itself.

We appeared to have advanced to the utmost limit possible that afforded cover. A few feet further would have carried us outside the margin of the timber; and then we should have been as conspicuous to the denizens of the camp, as they now were to us. Forward we dared not stir—not a step further.

I was puzzled and perplexed. Once more I turned my eyes upon the sky, but I drew not thence a ray of hope; the heavens were too bright; the sun had gone down in the west; but in the east was rising, full, round, and red, almost his counterpart. How I should have welcomed an eclipse! I thought of omnipotent power; I thought of the command of the Israelitish captain. I should have joyed to see the shadow of the opaque earth pass over that shining orb, and rob it of its borrowed light, if only for a single hour!

Eclipse or cloud there was none—no prospect of one or other—no hope either from the earth or the sky.

Verily, then, must I abandon my design, and adopt some other for the rescue of my betrothed? What other? I could think of none: there was no other that might be termed a plan. We might gallop for-

ward, and openly attack the camp? Sheer desperation alone could impel to such a course, and the result would be ruin to all—to her among the rest. We could not hope to rescue her—nine to a hundred—far we saw and could now count our dusky foemen. They would see us afar off; would be prepared to receive us—prepared to hurl their masses upon us—to destroy us altogether. Sheer desperation!

What other plan?—what— Something of one occurred to me at that moment: a slight shadow of it had crossed my mind before. It seemed practicable though fearfully perilous; but what of peril? It was not the time, nor was I in the mood, to regard danger. Anything short of the prospect of certain death had no terror for me then; and even this I should have preferred to failure.

We had along with us the horse of the captive Comanche. Stanfield had brought the animal, having left his own in exchange. My new design was to mount the Indian horse, and ride him into the camp. In this consisted the whole of my newly conceived scheme.

Surely the idea was a good one—a slight alteration of my original plan. I had already undertaken to play the rôle of an Indian warrior, while within the camp; it would only require me to begin the personation outside the lines, and make my *entrée* along with my *début*. There would be more dramatic appropriateness, with a proportionate increase of danger. But I did not jest thus; I had no thought of merriment at the time. The travesty I had undertaken was no burlesque.

The worst feature of this new scheme was the increased risk of being brought in contact with the friends of this warrior of the red hand—of being accosted by them, and of course expected to make reply. How could I avoid meeting them—one or more of them? If interrogated, how shun making answer? I knew a few words of the Comanche tongue, but not enough to hold a conversation in it. Either my falset accent or my voice would betray me! True, I might answer in Spanish. Many of the Comanches speak this language; but my using it would appear suspicious circumstance.

There was another source of apprehension: I could not confide in the Indian horse. He had endeavoured to fling Stanfield all along the way—kicking violently and biting at his rider while seated upon his back. Should he behave in a similar manner with me when entering the camp, it would certainly attract the attention of the Indians. It would lead to scrutiny and suspicion.

Still another fear: even should I succeed in the main points—in entering the camp, finding the captive, and wresting her from the hands of her jailers—how should I could never depend upon this capricious *mustang* carry us clear of the pursuit—there would be others swift, perhaps swifter than he, and we should only be carried back to die. Oh! that I could have taken my own steed near to the line of yonder guard—oh! that could have hidden him there!

It might not be; I saw that it could not be; as I was forced to abandon all thought of it.

I had well-nigh made up my mind to risk all the chances of my assumed character, by mounting the Indian horse. To my comrades I imparted the idea and asked their counsel.

All regarded it as fraught with danger; one or two advised me against it. They were those who did not understand my motives—who could not comprehend the sentiment of love—who knew not the strength of courage which that noble passion may impart. They understood they how its emotions inspire to deeds of daring—how love absorbs all selfishness—even it becoming a secondary consideration, when weighed against the happiness or safety of its object. They

rude men had never loved as I. I gave no ear to their too prudent counsels.

Others acknowledged the danger, but saw not how I could act differently. One or two had in their life's course experienced a touch of tender feeling akin to mine. These could appreciate; and counselled me in consonance with my half-formed resolution. I liked their counsel best.

One had not yet spoken—one upon whose advice I placed a higher value than upon the combined wisdom of all the others. I had not yet taken the opinion of the earless trapper.

CHAPTER LXXXVIII.

RUBE CONSULTING HIS ORACLE.

He was standing apart from the rest—leaning, I should rather say, for his body was not erect, but diagonal. In this attitude it was propped by his rifle, the butt of which was steadied against the stump of a tree, whilst the muzzle appeared to rest upon the bridge of Rube's own nose.

As the man and the piece were about of a length, the two thus placed in juxtaposition presented the exact figure of an inverted V, and the small close-capped skull of the trapper formed a sufficiently tapering apex to the angle. Both his hands were clasped round the barrel, near its muzzle, his fingers interlocking, while the thumbs lay flat—one upon each side of his nose.

At first glance, it was difficult to tell whether he was gazing into the barrel of the piece, or beyond it upon the Indian camp.

The attitude was not new to him nor to me; it was not the first time I had observed him in a posture precisely similar. I knew it was his favourite pose, when any question of unusual difficulty required all the energy of his 'instincts.' He was now, as often of yore, consulting his 'divinity,' presumed to dwell far down within the dark tube of 'Targuts.'

After a time, all the others ceased to speak, and stood watching him. They knew that no step would be taken before Rube's advice had been received; and they waited with more or less patience for him to speak.

Full ten minutes passed, and still the old trapper neither stirred nor spoke. Nor lip nor muscle of him was seen to move; the eyes alone could be detected in motion, and these small orbs scintillating in their deep sockets, were the only signs of life which he showed. Standing rigid and still, he appeared, not a statue, but a scarecrow, propped up by a stick; and the long, brown, weather-washed rifle did not belie the semblance. Full ten minutes passed, and still he spoke not; his 'oracle' had not yet yielded its response.

I have said that at the first glance it was difficult to tell whether the old man was gazing into the barrel of his gun or beyond it. After watching him closely, I saw that he was doing both. Now his eyes were a little raised, as if he looked upon the plain—anon they were lowered, and evidently peering into the tube. He was drawing the data of his problem from facts—he was trusting to his divinity for the solution.

For a long time he kept up this singular process of conjuration—alternating his glances in equal distribution between the hollow cylinder and the small circle of vision that covered the Indian camp.

The others began to grow impatient; all were interested in the result, and not without reason. Standing upon the limits of a life-danger, it is not strange they should feel anxiety about the issue.

Thus far, however, none had offered to interrupt or question the queer old man. None dared. One or two of the party had already had a taste of his quality

when fretted or interfered with, and no one desired to draw upon himself the sharp 'talk' of the earless trapper.

Garey at length approached, but not until Rube, with a triumphant toss of his head and a scarcely audible 'whEEP' from his thin lips, shewed signs that the consultation had ended, and that the 'joss' who dwelt at the bottom of his rifle-barrel had vouchsafed an answer!

I had watched him with the rest. I liked that expressive hitch of the head; I liked the low, but momentous sibilation that terminated the *séance* between him and his familiar spirit. They were signs that the knot was unravelled—that the old trapper had devised some feasible plan by which the Indian camp might be entered.

Garey and I drew near, but not to question him; we understood him too well for that. We knew that he must be left free to develop his purpose in his own time; and we left him free—simply placing ourselves by his side.

'Wal, Billee!' he said, after drawing a long breath, 'an yurself, young fellur! whet do 'ee both think o' this hyur bizness: looks ugly, don't it—eh, boyees?'

'Tarnal ugly,' was Garey's laconic answer.

'Thort so meself at fust.'

'Thar ain't no plan o' gettin into thar camp,' said the young trapper, in a desponding tone.

'The doose thur ain't! What greenhorn put thet idee inter yur brain-pan, Bill?'

'Wal, thar are a plan; but 'tain't much o' a one: we've been talkin it over hyar.'

'Le's hear it,' rejoined Rube, with an exulting chuckle—'le's hev it, boyee! an quick, Bill, fur time's dodrotted precious 'bout now. Wal?'

'It's jest this, Rube, neyther less nor more: the capt'n proposes to take the Injun's hoss, and ride straight into thar camp.'

'Straight custrin in do 'ee?'

'Ov coorse; it 'ud be no use goin about the bush: they kin see him acomin from ony side.'

'I'll be burned ef they kin—thet I'll be burned. Wagh! they cudn't 'a see me—thet they cudn't, ef ivery niggur o' 'em hed the eyes o' an Argoose—thet they cudn't, Billee.'

'How?' I inquired. 'Do you mean to say that it is possible for any one to approach yonder camp without being observed? Is that what you mean, Rube?'

'Thet ur preezactly whet I mean, young fellur. No—not adzactly thet eyther. One o' you I didn't say: whet I sayed wur, that this hyur trapper, Rube Rawlins o' the Rocky Mountains, kud slide inter yander campmint jest like greased lightnin through a gooseberry-bush, 'thout e'er an Injun seein 'im; an thet, too, ef the red-skinned vamints hed more eyes in thur heads than they hev lice; which, accordin to this child's reck'nin, 'ud hev ivery squaw's son o' the gang as many peepers as thur ur spots in a peacock's tail, an a wheen over to breed, I kalkerlate. No plan to git inter thur camp 'thout bein seed! Wagh! yur gettin green, Bill Garey!'

'How can it be accomplished, Rube? Pray, explain! You know how impatient!—'

'Don't git unpayshint, young fellur! thet ur's no use whetsomdiver. Yu'll need payshinse, an a good grist o' thet ur, afore ye kin warm yur shins at yander fires; but 'ee kin do it, an in the nick o' time too, ef yu'll go preezactly accordin to whet ole Rube tells ye, an keep yur eye well skinned an yur teeth from chat-terin: I knows yu'll do all thet. I knows yur weasel to the back o' yur neck, an kin whip yur weight in wild cat any day i' the year. Now? D'yr agree to follur my direkshuns?'

'I promise faithfully to act according to your advice.'

'Thet ur sensible sayed—durnation'd sensible. Wal, then, I'll gi' ye my device.'

As Rube said this, he moved forward to the edge of the timber, making a sign for Garey and myself to follow.

On reaching its outer edge, but still within cover, he dropped down upon his knees, behind some ever-green bushes.

I imitated his example, and knelt upon his right, while Garey crouched down on the left.

Our eyes were directed upon the Indian camp, of which, and the plain around it, we had a good view—as good as could be obtained under the light of a too brilliant moon.

After he had surveyed the scene for some moments in silence, the old trapper condescended to begin the conversation.

CHAPTER LXXXIX.

THE TRAPPER'S COUNSEL.

'Now, Bill Garey, an you, young fellur, jest clap yur eyes on thet 'ere campmint, an see ef thur ain't a road leadin inter the very heart o' it, strait as the tail o' a skeart fox. 'Ee see it? eh?'

'Not under kiver?' replied Garey interrogatively.

'Unner kiver—ivery step o' the way—the best o' kiver.'

Garey and I once more scrutinised the whole circumference of the encampment, and the ground adjacent. We could perceive no cover by which the camp could be approached. Surely there was none.

What could Rube mean? Were there clouds in the sky? Had he perceived some portent of coming darkness? Had his words reference to this?

I raised my eyes, and swept the whole canopy with inquiring glances. Up to the zenith, around the horizon—east, west, north, and south—I looked for clouds, but looked in vain. A few light cirrhi floated high in the atmosphere; but these, even when crossing the moon's disk, cast no perceptible shadow. On the contrary, they were tokens of settled weather; and moving slowly, almost fixed upon the face of the heavens, were evidence that no sudden change might be expected. When the trapper talked of entering the camp under cover, he could not have meant under cover of darkness. What then?

'Don't see ony kiver, old boss,' rejoined Garey, after a pause; 'neither bush nor weed.'

'Bush!' echoed Rube—'weed! who's talkin 'bout weeds an bushes? Thur's other ways o' hidin yur karkidge 'sides stickin it in a bush or unner a weed. Yur a gettin durnation'd pumpkin-headed, Bill Garey. I gin to think yur in the same purdicamint as the young fellur hisself. Yu've been a humbuggin wi' one o' them ur Mexikin moochachera.'

'No, Rube, no.'

'Durn me, ef I don't b'lieve you hev, boy. I heern ye tell one o' 'em'—

'What?'

'Wagh! ye know well enuf. Didn't 'ee tell one o' 'em gurls at the rancherie thet ye loved her as hard as a mule kud kick—sartintly ye did; them wur yur preezact words, Billee.'

'I was only jokin, boss.'

'Putty jokin thet ur 'll be when I gits back to Bent's Fort, an tell yur Coco squaw. He, he, he—ho, ho, hoo! Geehosophat! thur will be a rumpus.'

'Nonsense, Rube; thar's nothin ov it.'

'Thur must 'a be: yur brain-pan's out o' order, Bill; ye hain't hed a clur idee for days back. Bushes! an weeds too! Wagh! who sayed thur wur bushes? Whur's yur eyes? d' yur see a bank?'

'A bank!' echoed Garey and I simultaneously.

'Ye-es,' drawled Rube—'a bank. I guess thur's a bank, right afore yur noses, ef both o' yur ain't as blind as the kittlins o' a 'possum. Now, do 'ee see it?'

Neither of us made reply to the final interrogatory.

For the first time, we began to comprehend Rube's meaning; and our eyes as well as thoughts were suddenly directed upon the object indicated by his words—the bank of the stream—for to that he referred.

I have stated that the little river ran close to the Indian lines, and on one side formed the boundary of the camp. We could tell that the current was towards us; for the stream, on reaching the hill upon which we were, turned sharply off, and swept round its base. The Indian camp was on the left bank, though upon its right when viewed up-stream, as we were regarding it. Any one proceeding up the left bank must therefore necessarily pass within the lines, and through among the horses that were staked nearest to the water.

It need not be supposed that under our keen scrutiny the stream had hitherto escaped observation; I myself had long ago thought of it as a means of covering my approach. Time after time had my eyes dwelt upon it, but without result. In its channel I could perceive no shelter from observation. Its banks were low, and without either rush or bush upon them. The green turf of the prairie stretched up to the very brink, and scarcely twelve inches below its level was the surface of the current. This was especially the case along the front of the encampment, and for some distance above and below.

Any one endeavouring to enter the camp by stealing up the channel, must have gone completely under the water, for even a swimmer could have been observed upon its surface; or even if a man could have approached in this way, there was no hope that a horse could be taken near; and without the horse, what prospect of ultimate escape?

It had seemed to me impossible. More than once had I taken into consideration, and as often rejected the idea.

Not so Rube. It was the very scheme he had conceived, and he now proceeded to point out its practicability.

'Now, theen—ees see a bank, do 'ee?'

'Tain't much o' a bank,' replied Garey, rather discouragingly.

'No; 'tain't as high as Massoora bluffs, nor the kenyons o' Snake River—thet nob'dy durnies; but o' 'tain't as high as it mout be, it ur ivery minnit a gittin higherer, I reck'n.'

'Getting higher, you say?'

'Ye-es; or whet ur putty consid'able the same thing, the t'other ur a gittin lower.'

'The water, you mean?'

'The water ur a fallin—gwine down by inches at a jump; an in a hour from this, thur 'll be bluffs aforet o' the camp half a yurd high—thet's whet thur 'll be.'

'And you think I could get into the camp by creeping under them?'

'Sure o't. Whet's to hinner ye? it ur easy as fallin off a log.'

'But the horse—how could I bring him near?'

'Jest the same way as yurself. I tell yur the bod o' thet river ur deep enuf to hide the biggest hoss in creashun. 'Tur now fall, for the reexun thur's been a fresh in consykwince o' last night's rain: 'ee needn't mind thet—the hoss kin wade or swim eyther, an the bank 'll kiver 'im from the eyes o' the Ingens. You kin leave 'im in the river.'

'In the water?'

'In coorse—yur hoss 'll stan thur; an ef he don't, you kin tie his nose to the bank. You kin take 'em as near as you please; but don't go too far to wader, else them mustangs 'll smell 'im, an then it ur all up both wi' yurself an yur hoss. About two hundred yurds ull be yur likeliest distence. Ef you gits the gurl clur, ye kin easy run thet, I reck'n; put straight for the hoss; an whun yur mounted, gallop like

durnation up hyur for the timmer, whur we'll be cached; an then, durn 'em! ef the red-skins don't git goes out o' our rifles. Wagh! thet's the way to do the thing—*it ur.*'

Certainly, the plan appeared practicable enough. The sinking of the water was a new element; it had escaped my observation, though Rube had noted it. It was this that had delayed him so long in giving his opinion; he had been watching it while leaning upon his rifle, though none of the rest of us had thought of such a thing. He remembered the heavy rain of the night before; he saw that it had caused a freshet in the little river, that its subsidence had begun; and, as in most prairie-streams, it was progressing with rapidity. His keen eye had detected a fall of several inches during the half hour we had been upon the ground. I could myself observe, now that it was pointed out to me, that the banks were *higher* than before.

Certainly, the plan of approaching by the stream had assumed a more feasible aspect. If the channel should prove deep enough, I might get the horse sufficiently near: the rest would have to be left to stratagem and chance.

'*Tur ridin in the Injun hoss,*' said Rube, '*ud niver do: it mout, on the wust pinch; an ef ee don't git in the t'other way, yur kin still try it; but ye kud niver git acrost through the cayward: 'em mustangs 'ud be sure to make sich a smortin an stompin, an whigherin, as 'ud bring the hul campmint about ye; an some o' the sharp-eyed niggurs 'ud be sartint to find out yur hide wur white. T'other way ur fur the safest—it ur.*'

I was not long in making up my mind. Rube's counsel at once decided me, and I resolved to act accordingly.

CHAPTER XC.

TAKING TO THE WATER.

I spent but little time in preparations; these had been made already. It remained only to tighten my saddle-girth, look to the caps of my revolvers, and place both pistols and knife in the belt behind my back; there the weapons would be concealed by the pendent robe of jaguar-skins. In a few minutes I was ready.

I still loitered a while, to wait for the falling of the water; not long—I was too anxious to tarry long. The hour of the council might be nigh—I might be too late for the crisis. Not long did I loiter.

It was not necessary. Even by the moonlight, we could distinguish the dark line of the bank separating the grassy turf from the surface of the water. The slipping current was shining like silver-lace, and, by contrast, the dark earthy strip that rose vertically above it, could be observed more distinctly. It was sensibly broader.

I could wait no longer. I leaped into the saddle. My comrades crowded around me to say a parting word; with a wish or a prayer upon their lips, one after another pressed my hand. Some doubted of their ever seeing me again—I could tell this from the tone of their leave-taking; others were more confident. All vowed to revenge me if I fell.

Rube and Garey went with me down the hill. At the point where the stream impinged upon it, there were bushes; these continued up the declivity, and joined the timber upon the summit. Under their cover we had descended, reaching the bank just at the salient angle of the bend. A thin skirting of similar bushes ran around the base of the hill, and following the path by which we had come, the ambuscade might have been moved a little nearer to the camp. But the cover was not so good as the grove upon the summit, and in case of a retreat, it would be necessary to

gallop up the naked face of the slope, and thus expose our numbers. It was decided, therefore, to leave the men where they were.

From the bend to the Indian camp, the river trended almost in a straight line, and its long reach lay before my eyes like a band of shining metal. Along its banks, the bush extended no further. A single step towards the camp would have exposed me to the view of its occupants.

At this point, therefore, it was necessary for me to take to the water; and dismounting, I made ready for the immersion.

The trappers had spoken their last words of instruction and counsel; they had both grasped my hand, giving it a significant squeeze that promised more than words; but to these, too, had they given utterance.

'Don't be afeerd, capt'n!' said the younger. 'Rube and I won't be far off. If we hear your pistols, we'll make a rush to 'rest you, and meet you half-way anyhow; and if anything should happen amiss'—here Garey spoke with emphasis—'you may depend on't we'll take a bloody revenge.'

'Yees!' echoed Rube, 'we'll do jest thet. Thur'll be many a nick in Targuts afore next Krissmuss ef you ur rubbed out, young fellur; thet I swar to ye. But don't be skeart! Keep yur eye sharp-skinned, an yur claws steady, an thur's no fear but yu'll git clur. Oncest yur clur o' the camp, 'ee may reck'n on us. Put straight for the timmer, an gallip as ef Ole Scratch wur aggrupp'n at the tail o' yur critter.'

I waited to hear no more, but leading Moro down the bank, at a place where it sloped, I stepped gently into the current. My well-trained steed followed without hesitation, and in another instant we were both breast-deep in the flood. The water was just the depth I desired. There was a half yard of bank that rose vertically above the surface; and this was sufficient to shelter either my own head, as I stood erect, or the frontlet of my horse. Should the channel continue of uniform depth as far as the camp, the approach would be easy indeed; and, for certain hydrographic reasons, I was under the belief it would.

The plumes of the Indian bonnet rose above the level of the meadow-turf, and as the feathers—dyed of gay colours—would have formed a conspicuous object, I took off the gaudy head-dress, and carried it in my hand.

I also raised the robe of jaguar-skin over my shoulders, in order to keep it dry; and for the same reason, temporarily carried my pistols above the water-line.

The making of these slight alterations occupied only a minute or so; and as soon as they were completed, I moved forward through the water.

The very depth of the stream proved a circumstance in my favour. In wading, both horse and man make less noise in deep than in shallow water; and this was an important consideration. The night was still—too still for my wishes—and the plunging sound would have been heard afar off; but fortunately there were rapids below—just where the stream forced its way through the spur of the hill—and the hissing sough of these, louder in the still night, was borne upon the air to the distance of many miles. Their noise, to my own ears, almost drowned the splashing made by Moro and myself. I had noted this *point d'avantage* before embarking upon the enterprise.

At the distance of two hundred yards from the bushes, I paused to look back. My purpose was to fix in my memory the direction of the hill, and more especially the point where my comrades had been left in ambush: in the event of a close pursuit, it would not do to mistake their exact situation.

I easily made out the place, and saw that, for several reasons, a better could not have been chosen. The

trees that timbered the crest of the hill were of a peculiar kind—none more so upon the earth. They were a species of arborescent yucca, then unknown to botanists. Many of them were forty feet in height; and their thick angular branches, and terminal fascicles of rigid leaves, outlined against the sky, formed a singular, almost an unearthly spectacle. It was unlike any other vegetation upon earth, more resembling a grove of cast iron than a wood of exogenous trees.

Why I regarded the spot as favourable for an ambush, was chiefly this: a party approaching it from the plain, and climbing the hill, might fancy a host of enemies in their front; for the trees themselves, with their heads of radiating blades, bore a striking resemblance to an array of plumed gigantic warriors. Many of the yuccas were only six feet in height, with tufted heads, and branchless trunks as gross as the body of a man, and they might readily have been mistaken for human beings.

I saw at a glance the advantage of the position. Should the Indians pursue me, and I should succeed in reaching the timber before them, a volley from my comrades would check the pursuers, however numerous. The nine rifles would be enough, with a few shots from the revolvers. The savages would fancy nine hundred under the mystifying shadows of that spectral-like grove.

With confidence, strengthened by these considerations, I once more turned my face up-stream; and 'breasting the current, kept on.

CHAPTER XCI.

UP-STREAM.

My advance was far from being rapid. The water was occasionally deeper or shallower, but generally rising above my hips—deep enough to render wading a task of time and difficulty. The current was of course against me; and though not very swift, seriously impeded my progress. I could have advanced more rapidly, but for the necessity of keeping my head and that of my horse below the escarpment of the bank. At times it was a close fit, with scarcely an inch to spare; and in several places I was compelled to move with my neck bent, and my horse's nose held down to the surface of the water.

At intervals, I paused to rest myself—for the exertion of wading against the current wearied me, and took away my breath. This was particularly the case when I was required to crouch; but I chose my resting-places where the channel was deepest, and where I could stand erect.

I was all the while anxious to look up and take a survey of the camp: I wished to ascertain its distance and position; but I dared not raise my head above the level of the bank. The sword that crowned it was smooth as a mown meadow, and the edge-line of the turf even and unbroken. Had I shewn but my hand above it, it might have been seen in that clear white light. I dared not shew either hand or head.

I had advanced I knew not how far, but I fancied I must be near the lines. All the way, I had kept close under the left bank, which, as Rupe had predicted, now rose a full half yard above the water-line. This was a favourable circumstance, and another equally so was the fact that the moon on that—the eastern side—was yet low in the sky, and consequently the bank flung a broad black shadow that extended nearly half-way across the stream. In this shadow I walked, and its friendly darkness sheltered both myself and my horse.

I fancied I must be near the lines, and longed to reconnoitre them, but, for the reasons already given, dared not.

I was equally afraid to make any further advance—for that might be still more perilous. I had already

noted the direction of the wind: it blew *from* the river, and *towards* the camp; and should I bring my horse opposite the line of the mustangs, I would then be directly to windward of them, and in danger from their keen nostrils. They would be almost certain to take up the scent of my steed, and utter their warning snorts. The breeze was light, but so much the worse. There was sufficient to carry the smell, and not enough to drown the plunging noise necessarily made by my horse moving through the water, with the hollow pounding of his hoofs upon the rocks at the bottom.

If I raised my head over the bank, there was the danger of being observed; if I advanced, the prospect was one of still greater peril.

For some moments I stood hesitating—uncertain as to whether I should leave my horse, or lead him a little further. I heard noises from the camp, but they were not distinct enough to guide me.

I looked back down the river, with the hope of being able to calculate the distance I had come, and by that means decide where I was; but my observation furnished no data by which I could determine my position. With my eyes almost on a level with the surface of the water, I could not judge satisfactorily of distance.

I turned my face up-stream again, and scrutinised the parapet line of the bank. Just then I saw an object over its edge that answered well to guide me; it was the croup and hip-bones of a horse—one of the mustangs staked near the bank. I saw neither the head nor shoulders of the animal; its hind quarters were towards the stream; its head was to the grass—it was browsing.

The sight gratified me. The mustang was full two hundred yards above the point I had reached. I knew that its position marked the outer line of the encampment. I was just in the place where I wanted to be—about two hundred yards from the lines. Just at that distance I desired to leave my horse. I had taken the precaution to bring with me my picket-pin—one of the essentials of the prairie traveller. It was the work of a moment to delve it into the bank. I needed not to drive it with violence: my well-trained steed never broke fastening, however slight. With him the stake was only required as a sign that he was not free to wander.

In a moment, then, he was staked; and with a 'whisper' I parted from him, and kept on up-stream.

I had not gone a dozen yards further, when I perceived a break in the line of the bank. It was a little gully that led slantingly from the level of the prairie down to the bed of the stream. Its counterpart I perceived on the opposite side. The two indicated a ford or crossing used by buffaloes, wild-horses, and other denizens of the prairie.

At first, I viewed it with apprehension; I feared it might uncover my body to the eyes of the enemy; but on coming opposite, my fears were allayed: the slope was abrupt, and the high ground screened me as before. There would be no danger in passing the place.

As I was about moving on, an idea arrested me; and I paused to regard the gully with a look of greater interest. It offered me an advantage.

I had been troubled about the position in which I had left my horse. Should I succeed in getting back of course it would be under the pressure of a hot pursuit, and my steed was not conveniently placed; his back was below the level of the bank. He might easily be mounted, but how should I get out of the bottom of the stream. Only by a desperate leap might I reach the plain above; and he might fall in the effort—time might be lost, when time and speed would be most wanted.

I had been troubled with this thought; it now troubled me no longer. The 'crossing' afforded opportunity.

access either to or from the channel of the river—the very thing I wanted.

I was not slow to profit by the discovery. I turned back, and having released the rein, led my horse gently up to the break.

Choosing a spot under the highest part of the bank, I fastened him as before, and there left him.

I now moved with more ease and confidence, but with increased caution. I was getting too near to risk making the slightest noise in the water; a single splash might betray me.

It was my intention to keep in the channel, until I had passed the point where the horses were staked; by so doing, I should avoid crossing the line of the horse-guards, and, what was quite as important, that of the horses themselves, for I was equally apprehensive of being discovered by the latter. Once inside their circle, they would take no notice of me, for doubtless there would be other Indians within sight; and I trusted to my well-counterfeited semblance of savagery to deceive the eyes of the equine sentinels.

I did not wish to go far beyond their line; that would bring me in front of the camp itself—too near its fires and its idle groups.

I had noticed before starting that there was a broad belt between the place occupied by the men, and that where their horses were staked. This 'neutral' ground was little used by the camp loungers, and somewhere on the edge of it I was desirous of making my *entrée*.

I succeeded to my utmost wishes. Closely hugging the bank, I passed the browsing mustangs; under their very noses I glided past, for I could hear them munching the herbage right over me; but so silently did I steal along, that neither snort nor hoof-stroke heralded my advance.

In a few minutes, I was sufficiently beyond them to make halt.

I raised my head; slowly and gently I raised it, till my eyes were above the level of the prairie slope. No one was near. I could see the swarth savages grouped around their fires; but they were a hundred yards off, or more. They were capering, and talking, and laughing; but no ear was bent, and no eye seemed turned towards me. No one was near.

I grasped the bank with my hands, and drew myself up. Slowly and silently I ascended, like some demon from the dark trap-door of a stage. On my knees, I reached the level of the turf; and, then gently rising to my feet, I stood erect within the limits of the Indian camp—to all appearance as complete a savage as any upon the ground!

THE GLORIOUS UNCERTAINTY OF THE LAW.

It has now for some years been a very well-accredited fact, that there are many big as well as little matters in our otherwise excellent system of jurisprudence which require improvement; and although lawyers, as a class, are perhaps not generally favourable to alteration, some defects in legal proceedings are so glaring, and their evil influence on the community at large so considerable, that those in as well as those out of the profession of the law alike agree in the desirableness of a change.

Attention has of late been very much directed towards the subject of appeals; and although no alteration of any great importance has yet been made in the mode of conducting them in the superior courts, the evils to be remedied are so formidable, that we doubt whether any subject can better illustrate to the general reader the delay and expense which may be attendant upon the administration of the law, than the subject of 'appeals.' That the opinion of a single judge, however eminent and learned he may

be, should be final and conclusive, is what no sensible person will for a moment urge: all men are liable to error; and whatever be the wisdom of the expounder of the law, he may easily see things in a wrong light, and be led to draw conclusions, his judgment upon which, if final, would not only bring odium upon the law which he professes to understand, but entail injustice and oppression upon those who had the misfortune to be the unsuccessful parties.

In our own, and in almost every other civilised country, we find that this opinion has prevailed, and that a right of appealing from the decision of one court to that of another, exceeding the former in the number or presumed greater wisdom of its presiding officers, has been recognised. But in England this system of appeal has become so complicated, as to be unintelligible to the non-legal inquirer, who often wanders through the newspaper summary of some long legal proceeding in which he feels an interest, and after learning that 'the judge on the original trial directed a verdict for the plaintiff'—that the 'court above' granted a 'rule nisi' for a new trial, such rule being subsequently 'discharged,' but a '*venire de novo*' awarded on a 'writ of error,' which was contested in the House of Lords, and 'the decision of the Court in Banc affirmed the proceedings in error being quashed,' casts away the puzzling report in disgust, still without an answer to the only question he cares to ask respecting the matter—'Which side won?'

It may not, therefore, be altogether uninteresting to attempt a short sketch of the complex apparatus at present used in our courts for conducting legal inquiries.

Taking the *common law* first, we find in Westminster Hall three courts—the Queen's Bench, Common Pleas, and Exchequer. Each of these courts has five judges—fifteen in all—who, during the year, try, on the average, in town and country, about 2500 civil causes, every one of such causes being tried by a judge of either of these three courts sitting alone, with the assistance of a jury.

When a verdict is given, whether for plaintiff or defendant, the unsuccessful party may, if he pleases, apply to the judges of the court in which the action commences—who sit four of them together, in *Banc*, as it is termed, every day during term to receive such applications—asking them to set the verdict aside. He may assert various grounds for the request: That the judge misdirected the jury; that the jury gave a perverse verdict, or one not warranted by the evidence; that new matters have come to light since the trial, which materially alter the appearance of the case; &c. If the judges think that there is something in the application, and choose to hear what can be said on the other side, they grant what is called a rule *nisi*, or, in plain English, consent to the application *unless* the other side appears before them, and proves its impropriety. When the other side has been heard, the judges, having the whole matter before them, give their solemn opinion as to whether the proceedings in the cause are valid and proper, or the reverse.

Having done so, it might be imagined that the affair was at an end, for it seems altogether unlikely that the solemn decisions of *four* learned judges should be incorrect; but in reality, an appeal lies in almost every instance from the judgment of the four judges in *Banc*, to what is termed the 'Court of Error.' The composition of this court is somewhat ingenious. We have already said that there are three superior courts of common law, in either of which an ordinary action may be brought. The Court of Error is composed of the judges of the two courts in which the action is *not* brought; so that in this way, the judges of the Court of Common Pleas and Exchequer, sitting together, hear errors from the Queen's Bench; the

Courts of Queen's Bench and Exchequer hear those from the Common Pleas; and the Common Pleas and Queen's Bench dispose of those from the Exchequer; and as *all* the judges of either court sit in a Court of Error, ten judges confirm or overrule the judgment of four.

Of course, it requires rather a well-filled pocket to set the Error Court in motion, and the majority of suitors are obliged to be contented with the judgment obtained in Banc. Out of about 500 cases heard annually before the judges in Banc, not more than from twenty-five to thirty find their way into the Court of Error.

But even the Court of Error, with its imposing array of ten sages of the law, is not the *last* resource. The law, wisely considering that the judges of the land are, after all, but *commoners*, and their learning and judgment only those of commoners, has given a right of appeal from their decision as pronounced in a Court of Error, to the House of Lords, presuming—to quote an ancient authority—that ‘those whom the king hath by prerogative and in the discretion of his princely wisdom ennobled, be ennobled in mind and understanding as well as in earthly estate, and be better able to determine dark and weighty matters than are commoners.’ The House of Lords, then, is the ultimate tribunal; and it is there, and there alone, that the suitor, blest with sufficient money and patience to save him from his breaking down on the road, may be presumed to get pure, unimpeachable law—the ‘perfection of reason,’ as Blackstone designates it. Happy suitor! we sincerely hope that when he obtains he may enjoy it.

Whether the members of the House of Lords ever sat in any great number and heard appeals from courts of law, without calling in the assistance and receiving the advice of the judges of such courts, we do not know, and the matter is somewhat doubtful; but of late years, it seems to have been discovered, that ‘the ennobling of the mind and understanding,’ contingent upon an elevation to the peerage, does not at all events give an intuitive perception into profound and difficult legal questions, and that the only ‘coronet wearers’ who are competent to determine such, are, 1st, The lord chancellor, who is ‘ex-officio’ Speaker of the House; and 2d, Certain members of the legal profession who, having once held high judicial offices in courts of law or equity, have retired from their judicial posts, and are now members of the ‘Upper House.’

The number of ‘law-lords,’ as they are technically called, is thus necessarily very limited; and as, from age and infirmity, some cannot attend upon any, and none upon *all* the appeal cases, the actual number of peers before whom any case is heard is small indeed, being, beside the chancellor, not more than three, and oftener two. On this and other accounts, the appellate jurisdiction of the House of Lords is considered by all parties very much in need of improvement, and not more than ten or twelve appeals from the Court of Error—seldom, indeed, so many—annually find their way into it.

If, indeed, the House, as a court of appeal from the common law-courts, was attended *only* by the few individuals we have mentioned, it is probable there would be a good deal more grumbling as to the inefficiency of the court than there is; but from time immemorial, it has been customary to summon all the fifteen judges of England to hear such appeals. These learned individuals, however, judges though they be in other places, are no judges here. In the writs summoning them to every new parliament, they are only called upon to ‘treat and advise,’ whilst the peers themselves are to ‘hear and determine’ matters coming before them. The judges are, therefore, quite secondary individuals in the House of Lords; they cannot, by the rules of the House, ask a question of the counsel

conducting the case; cannot make a single observation, or correct any error during the progress of the argument; and when the long-winded speeches are all over, they must patiently wait the pleasure of the House before they offer their *opinions*, by which the judgment of the lords is not in the slightest degree bound, for two or three of those great individuals may, and more than once have, set at naught the solemn opinions of nearly all the judges, although those opinions have been supported by the grave authority of the lord chancellor himself!

Such, then, are the several tribunals before which an action at common law may be successively brought. ‘Well,’ exclaims the reader, ‘after all, it is an excellent arrangement for securing justice at last.’ True, good friend, but what a long way off the at last is; and what a deal of money it takes to reach it! A millionaire, indeed, may be badly treated at Nisi Prius; may be set on his legs by the Court in Banc; be knocked over by his opponent in Error; and, finally, at a cost altogether of several thousands, have his *rights* awarded him in the House of Lords. But the poor widow, whose bit of freehold has been encroached upon by a rich neighbour, after seeing the verdict she has obtained by the outlay of her last penny set aside by the judges in Banc, must be content to lose both money and land, simply because she has no funds to put the expensive machinery of the Court of Error in motion.

Let us follow a man with a little money into the courts. Here is our friend, Mr John Smith of Norfolk, a decent respectable yeoman, with a farm of some 200 acres, and a snug little matter of L.1000 in the funds. He is not married, but is courting the pretty rosy-cheeked Elizabeth Baker, the belle of the village, and leads altogether a most jolly sunshiny life. But alas! John Smith goes to law! Old Wickens, his neighbour, a grasping curmudgeon, who farms the adjoining land, has for years past asserted his right to about half an acre of marshy soil, on the extreme border of John's farm, called Squash Corner, of no use to anybody, and as to the ownership of which there have been disputes before Old Wickens himself was born. John, of course, won't give up, and so to law they go—a thin, parchment-faced, one-eyed old shark of an attorney ‘looking up’ Wickens's case; and a bland, unctuous, take care of Number One, professional man, Mr Codecil, managing John's little affair. The dry legal matters preliminary to the trial would be perfectly uninteresting to the reader, and we therefore omit them. The cause comes on for trial at the new Norwich Assizes. Before it is half over, a very knot-point arises, to the extreme delight of counsel and attorneys on either side. The judge reflects; looks into some half-dozen books; confers with his brother judge, who is trying criminals in the adjoining court; and eventually says (oh! ominous words), ‘that he shall reserve the point.’ The trial proceeds, and John gains the day. Wickens's parchment-faced friend is in ecstasies: the point reserved is in his favour, and the idea of moving in the court above, quite obliterates any unpleasantness arising from an adverse verdict. ‘Ah!’ says Codecil, as he pockets a little matter of L.200 received from John, ‘those fellows will give some more trouble yet, depend upon it.’

Next term, Wickens's counsel moves in the court above for a rule *nisi* to reverse the verdict, or for a new trial, and, with some difficulty perhaps, obtains it. John, of course, must defend the verdict he has gained at such a heavy cost, and by the advice of Codecil, instructs counsel to argue to ‘discharge’ the rule. Half a year after, the court is prepared to hear the case. John buys a new suit of clothes, and comes up specially to Westminster Hall, but is astonished at the curious way in which the matter is got through. The good old days when one counsel would

long clear speech, and set out all the facts; when either 'followed on the same side;' when each of their numerous 'points'—for counsel were then, as now, in that respect a sort of legal porcupine—was verily answered; and the judges, calm and dignified in the argument, afterwards gave their judgment have long passed away, and now a sort of verbal shorthand is the order of the day.

First, the judge who tried the cause, and who is a member of the same court in which the action is fought, reads his notes of the original trial; then his leading counsel, Mr Nollepross, holds a sort of piped and entangled conversation with the four judges once, and sits down after a very few minutes, quite rare that 'the court is with him.' Wickens's counsel, Mr Yearbook, then takes up the matter, and something like the following conversation is kept up between the learned judges—whom we respectively designate Justices A, B, C, and D—and the counsel:

Yearbook. My lords, I appear to support the rule in this case: it is, as your lordships have heard, a case of trespass, tried last Norwich Assizes, before Mr Justice D.

Justice B. Have you another copy of the pleadings to hand up?

(Handed up.)

Year. My lords, in this case—

Justice C. Is there no plan of the farm?

Year. Here is one, my lords.

(All the four judges look at it and talk about it at once, and eventually Justice B gets it to himself.)

Justice A. Go on, Mr Yearbook.

Year. My lords, I was saying—

Just. B. It's a strange thing; I've sat on the bench a great number of years, and I never knew a plan to be made the right size!

Year. No, my lord. My lords, in this case—

Just. B. Which is the north of the plan?

Year. At bottom, my lord. My lords—

Just. B. I thought so; it's always the way. Why isn't the architect who constructs the plan put the north to the north, and the south to the south?

Year. Yes, my lord. My lords—

Just. B. I wouldn't allow them their expenses, if they can't do work in a proper manner.

Year. No, my lord. My lords, I was saying—

Just. D. The second plea to this declaration, Mr Yearbook, won't hold water.

Just. B. O no; you certainly can't rely on the second plea.

Year. My lords, if your lordships will permit me—

Just. D. I own I can't see the relevancy of the first plea.

Just. B. The pleadings are very inartificial.

Year. I am coming to the second plea, my lord.

Just. A. It may reasonably be presumed from the ordinary nature of pleading, and from the various circumstances.

Just. C. There is no joinder in demurrer, or else a question might arise on the third plea.

Just. B. Clearly not.

Just. C. O yes.

Just. D. Well, I don't think, Mr Yearbook, that you will succeed—that's my impression.

Year. If your lordships think—

Just. B. No, not exactly so; but you see the second plea—

Year. My lord, that's what I am coming to—

Just. C. What we really want to know is—

Just. B. Usher! first Meesom and Welsley, twelfth Barnwall and Alderson, Comyn's digest; title, 'Estoppel.'

Year. Perhaps your lordships are not aware that it has been decided in—

Just. B. O yes, in Sharpe's case; but that is very shaky law; in my own time, in Edger and

Dodger, which you will find in third Manning and Grainger—

Just. A. I was counsel in that case; it occupied five days and a half.

Just. D. I only reserved the point to hear if you could make anything of it, Mr Yearbook.

Just. C. O yes; and we only granted the rule nisi because you pressed it so much.

Just. B. Well, I don't know; I think the ruling was perfectly right.

Just. C. Rule discharged.

Just. D. I think so decidedly.

Just. B. Come, call on the next case.

Year. Then, my lords—

Just. B. O dear, no; it's idle, Mr Yearbook, to—

Just. C. O dear, yes. Rule discharged.

'Bravo!' says Mr Codecil, as he leaves the court; 'we've conquered them now, in good earnest.'

But Codecil, deep fellow! knows as well as possible the nature of his parchment-faced friend, and in this, as in other cases, acts upon the spirit of the ancient distich:

Here are two fat wethers fallen out with one another,
If you'll fleece one, I'll fleece the other!

and therefore it is with no surprise, and with considerable delight, that some few days after he receives a little notice, which he at once communicates to his client, that a 'memorandum has been left with a master of the court, stating that there is *error in law*, in the record and proceedings in *Smith v. Wickens*!'

'Very good, very good!' says Mr Codecil; 'if he chooses to go into *Error*, of course we have nothing to do but to follow him.'

'Will these things *ever* end?' says poor John Smith, as he slowly draws another check for a considerable amount, and hands it to Codecil.

'My dear fellow,' says that excellent professional adviser, 'it will all turn out right in the end, trust me for it.'

John goes back to Norfolk, and in about a year's time his case comes on in *Error*. He does not make his appearance in court this time, for he very justly considers, that if he could not understand five words of the argument before four judges, he is not very likely to understand much of it when conducted before ten. Mr Yearbook, who opens the case in *Error*, has a great deal to say, a great many books to refer to, and is not nearly so much snubbed as in the court below. He and another counsel on the same side occupy an entire day in their arguments, and Mr Nollepross and his junior are even longer. Yearbook replies; the judges take time to consider the question; and a month afterwards they give judgment for the appellant *Wickens*!

What is John Smith to do? 'Go to the House of Lords, decidedly,' says Codecil; 'I know it must come right in the end.' He has a right to go there—to make Wickens go there. A painstaking judge, sitting at Nisi Prius, has said that he is right; twelve impartial jurymen have said that he is right; four judges sitting together have said that he is right; and now he is told, that he has been wrong all along! 'Go to the House of Lords, de-ci-ded-ly,' says Mr Codecil.

Alas! what is to take him there?—L.900 of his L.1000 have disappeared in law-expenses; the horrible amount of costs accruing on the proceedings in *Error*, and yet unpaid, will swallow up a good L.500 or L.600 more, to raise which, part of the farm must be sold; and John sees, that if he goes up to the House of Lords, and is unsuccessful there, he shall scarcely have a penny left him in the world. He therefore does, what Codecil declares is 'a thousand pities,' gives up to Wickens Squash Corner, sells enough of his farm to enable him to pay all his law-expenses, abandons for the present all hopes of marrying Elizabeth Baker, and

sets heartily to work on his remaining bit of property, a far poorer, but far wiser man.

Such is a short sketch of the present method of conducting common-law appeals. Were we not afraid of swelling our article beyond all reasonable bounds, we might shew the operation of the equity and of the spiritual courts in these matters—how, in the equity courts, cases may be heard and re-heard, and little *legal* points arising during their progress, be sent out to be tried as issues in a court of common law, at an enormous expenditure of time and money, until all the property in dispute, and a good deal besides, has been frittered away in costs, and long years of anxiety and vexation have passed over the heads of the devoted suitors, who at length, as a last resource, appeal to the House of Lords, and find as their *sole* judge there the very officer from whose decision they are appealing!

Turning to Doctors' Commons, we might shew also, how, in the Prerogative Court, a decision may be obtained, which shall be soon after set aside by a judgment of the Court of Arches, which will shortly, in its turn, be overruled by a judgment of the judicial committee of Privy Council, and then—some little common-law points arising—the case itself—as occurred not many years ago—be carried, after the long journey it has already made, through every one of the three courts of common law!

Only one branch of our jurisprudence is not subject to this lengthy and costly system of appealing, and it is the *criminal* law.

The case of a prisoner who has been tried and acquitted, can of course never afterwards be inquired into; while that of a person convicted can only again become the subject of judicial investigation should some *legal* point arise which the judge voluntarily reserves for the opinion of the Court of Criminal Appeal. When this is the case, the point is argued at Westminster, as soon as possible after the original trial, before five judges sitting together. If they are uniform in opinion, one way or the other, the matter ends; if they differ, no matter what the majority, the case is re-argued before all the fifteen judges, also sitting together, and their decision, or that of the majority of them, is final and irrevocable. The judges, however, usually dislike to impose upon a prisoner the anxiety which reserving his case must necessarily occasion, and, unless they have grave doubts on the matter, lay down the law themselves upon the trial. Not more than 40 or 50, out of about 8000 or 10,000 prisoners tried annually in England and Wales, have their cases reserved.

Such, reader, is the way 'appeals' are conducted; and after a pretty fair experience of the 'glorious uncertainty of the law,' the best advice we can give you is—never go into court if you can possibly keep out of it!

CONCOMITANCE OF HIGH CIVILISATION AND BAD TEETH.

It is remarkable that this prevalence of disease of the teeth occurs to such an extent only on the race of mankind to which we belong. In the other branches of the human family, the disposition of the teeth to decay does not exist, or, where present, does not prevail to such an extent. It would appear, indeed, as if a faulty structure of the teeth were an attribute of superior civilisation, and that the more savage man becomes, the more perfect and impervious to decay are his teeth. In the negro and similar races, caries of the teeth seldom occurs. There is little doubt that many of the habits and customs which attend the advance of society in luxury and refinement are injurious to the teeth. Still, these can be looked upon only as very unimportant causes, and are quite insufficient to account for the evident predisposition of the teeth to decay, by which the civilised races are characterised. It would form much too abstruse a subject for these pages to inquire into the probable dependence which exists between

the greater cerebral development which is the undesirable result of civilisation, and the deficiency in the bony structure of the teeth—which dependence we have little doubt will yet be recognised as forming the principal cause of the defective teeth of the more civilised races of mankind.—*Nisbet's Digestion and the Teeth.*

'WILL SAIL TO-MORROW.'

THE good ship lies in the crowded dock
Fair as a statue, firm as a rock,
Her tall masts piercing the still blue air,
Her upright funnel all white and bare—
Whence the long soft line of vapoury smoke
Twixt sky and sea like a vision broke,
Or slowly o'er the horizon curled,
Like a lost hope gone to the other world:
She sails to-morrow—
Sails to-morrow.

Out steps the captain, busy and grave,
With his steady footfall—quick and brave,
His hundred thoughts and his thousand cares,
And his quiet eye that all things dares:
Though a little smile o'er the kind face dawns
On the loving brute that leaps and fawns,
And a little shadow comes and goes
As if heart or memory fled—where, who knows!
He sails to-morrow—
Sails to-morrow.

To-morrow the thronged line of ships
Will quick close after her as she slips
Into the unknown Deep once more;
To-morrow, to-morrow, some on shore
With straining eyes shall desperate yearn—
'This is not parting? Return—return!'—
Peace, wild-wrang hands! Hush, quivering breath!
Love keepeth his own through life and death,
Though she sails to-morrow—
Sails to-morrow!

Sail, stately ship; down Southampton-Water
Gliding fair as old Nereus' daughter,
Christian ship that for freightage bears
Christians, followed by Christian prayers.
God! send angels after her track!
Pitiful God, bring the good ship back!—
All the souls in her for ever keep
Thine—living or dying, awake or asleep.
Then, sail to-morrow:
Ship, sail to-morrow!

May 6.

BAVARIAN PRISON-REFORM.

When M. Obermaier first arrived at Munich, he found from 600 to 700 prisoners in the jail, in the worst state of insubordination, and whose excesses, he was told, deserved the harshest and most stringent discipline; the prisoners were all chained together, and attached to each chain was an iron weight, which the strongest found difficulty in dragging along; the guard consisted of about 100 soldiers, who did duty not only at the gates and around the walls, but also in the passages, and even in the workshops, dormitories; and, strangest of all protections against the possibility of an outbreak or individual evasion, twenty or thirty large savage dogs of the blood-hound breed were loose at night in the passages and courts, to keep the watch and ward. M. Obermaier's system of kindness and labour has now so completely changed this pandemonium that the prison-gates stand wide open, without a sentinel at the door, and a guard of only twenty men idling away their time in a guard-room off the entrance-hall. *Murray's Not so Bad as they Seem.*

TANCRED HALL:

A NARRATIVE.

CERTAINLY, as Slawkenbergius observed to the Rosicrucians, the eccentricities of mankind can never be fully expressed by the formula $(a + 1)^n$. For instance, the introduction of a single minus—of an individual who, to use an expressive Yorkshire idiom, is *not all there*, will lead your calculation to most unforeseen results. One of these results, which last summer fell within the scope of our own observation, we propose now to describe, and that in a style as simple and severe as befits the contemporaries of Macaulay and the Rev. George Gilfillan.

On the skirts, then, of the North Riding Hills—those hills which break at last into the crested cliffs of Knaresborough—stands an old Tudor mansion, lonely, demonstrative, not to be passed without inquiry by traveller or tramp. What is it doing there, shorn of its rookery and elms, and mulcted of nearly all its ancient park? You can see all up the terraced gardens from the road below. The ha-ha is abolished, and privacy extinct. Still, somebody must live there, for the hereditary housemaid is even now drawing up the blinds. Come up into the old church-yard, which takes the hall in flank; there is a private door there, leading to the kitchen-garden, and on it is inscribed, '*Tancred Hospital: no admittance except on business.*' How is this? This an hospital, and in the wilds of Yorkshire too! Come directly to the parsonage, and ask our friend the warden: he is an amiable fellow, if ever there was one, and he will tell us. Yes, he will go with us at once; and we enter by the private door; for what is business, madam, but pleasure in harness? We pass round to the terrace-gardens in front. No flowers there now, certainly. The steps, too, are green and 'slape,' and the stone knobs on the balustrade have caps of antique moss; but there is soft grass all over of a century's growth, and plenty of illegitimate footpaths meandering across it. The steps lead up to the fore-court—now a green lawn between the projecting wings of the house; and beyond the fore-court is the great hall-door. The warden tries his key, and we enter. A hall of the period, truly! shooting up at once to the very top of the house; garnished with stately pilasters, and comforted with huge roaring chimneys; but now cold and silent, and ceiled across at half its height, like Ben Nevis in a mist. Still, there are the pictures: Sir Richard Tancred, master of the hounds to William III.; and Charles Tancred, Esq., our hero; and Queen Anne, and Mary Queen of Scots. Here, too, are arms, and luxurious trifles of the Caroline age; and here is the old chair where good Queen Mary sat.

The coffin used to hang from that large hook in the ceiling, till they put it in— But suddenly the hall-door opens, and enter a gentlemanly man in a moustache and a Glengarry bonnet, carrying under his arm—*proh pudor!*—a bundle of cabbages! Certainly, there was something of bathos in the sight of that agreeable esculent—redeemed, however, by the pathos of a second figure that strode in behind the first—an aged tremulous hero, consisting chiefly of a stiff blue cloak and a wide-awake, with a hooked nose by way of copula. The two bowed deferentially to our warden, and vanished into dusky distance. 'Yes, these are two of them,' says the vicar: 'O'Jibaway was a wild fellow once—spent his fortune in keeping the Aniseed hounds; the other is old Trotter of the Blankth—lost an arm tiger-hunting in India before he got his company, poor fellow.' And so we stroll into the great drawing-room, looking out on the bowling-green that was. It is furnished like a club-room, in spite of its wainscot, embossed ceiling, and statuesque mantelpiece; and the round tables with magazines and papers look pretty much as the distinguished moderns in tie-wigs look in Westminster Abbey. Comfortable, however, for the old fellows, when they turn out of their 'studies' in a morning; which they don't always do, though, for some of them haven't the best constitutions. None of them are there now, at anyrate; so we open an inner door, and enter the chapel, which I suspect—and indeed our friend but faintly denies it—was formerly the back drawing-room. However, it has episcopal sanction now; and there's a quaint Georgian pulpit in it, and a singular appearance of altar-rails without an altar, at one end; and here they all meet for service every day. So I think, in this particular at least, we may subtract the minus from old Tancred's character. 'By the way,' says the warden, 'the coffin used to be here at one time; but you haven't seen the dining-room, and they'll be going to dinner at two.'

We don't see them at dinner—that would be an insult, for they are gentlemen still, you know, and are here as such—but we see the room, and John Thomas is setting out the table in a cleanly but somewhat parochial fashion. A strange old room, lining one side of the hall, as the drawing-room the other, and looking out on the fore-court. One wall is smothered to the cornice with the brethren's kists, each bearing his name without, and his mug and spoon within. Just opposite, over the broad fireplace, is an old map of the estate, and near it hangs a print of the hall and park as they appeared in those days, when the hedges were duly clipped and the pleasureau stocked with flowers, and when the avenue extended far beyond the present

usurping road. Sir Richard Tancred is there too with his fox-hounds, on a heroic scale; but John Thomas is a nuisance, so we adjourn to the grand staircase; and here I confess to a disappointment. Certainly, the place is dingy and dark, and near the bottom is an ominous coal-cellar, which looks very like an *oubliette*. Modern housemaids, however, have not the energy of their ancestors, as the mullioned window testifies; and the strong carved balustrade, too, has been painted yellow by some extravagant warden, with a fine eye for colour. After all, though, this is perhaps the most interesting part of the house; for on the landing above is a goodly row of family portraits—Nevilles, and Dacres, and Wyvills of the civil wars; and the bare white walls, as you go up, are covered with the painted pedigree of the Tancred—a planetary system of double stars, ending with the lonely circumference of our hero. As an *amari aliquid* to these aristocrats, the effigies of 'J. Gurth, swineherd to Sir R. T., Knt.,' hangs unabashed among them all—a humorous rustic, with a grizzly beard, and a twinkle in his eye which accounts for his immortality.

These are our limit: beyond, lie the penetralia of the brethren, and the serene adytum of Mrs Jellicoe the housekeeper. It remains for us only to descend—*facilis descensus Averni*, and that is the place we have yet to see. We climb down the rude cellar-stairs, and past the *oubliette*; we creep silently along dim passages full of damp green smells and cold thrilling airs, and awful with the neighbourhood of a ghostly presence; we reach a low black door; the rusty key of our hierophant grates in the unfrequented wards; we enter, and are mute.

Here is blackness of darkness and oblivious silence; the air has a sickly odour of ancientness and death; our feet stick to the cold clammy floor; we hear, but cannot see the fetid moisture trickling down the walls. Only one ray of light slopes down into the place, but it falls upon the thing we seek—it falls upon an *unburied coffin*.

And now, perhaps our readers would like to know what we mean, and what 'our hero' means, and, in fact, what is the meaning of these things in general. We will therefore take the liberty of introducing the following appropriate and authentic details. The Tancred was a Yorkshire family of some note, the male line of which became extinct in the person of Charles Tancred, who died in 1754. Charles Tancred, who was a Cambridge man, and a barrister or benchet of Lincoln's Inn, had the misfortune—so common in those unhappy classes—to be jilted in his youth, and he thereupon made and executed two resolutions: first, to remain always a bachelor; and second, to illustrate the celebrated maxim of Pericopius, that benevolence is the child of selfishness, and the mother of eccentricity. In fact, he had on his death-bed the satisfaction of knowing that in converting his house and estate by will into an hospital—with a large sum in the funds to support it—he had extinguished his family, and impoverished his sisters and their children. The inmates of the hospital were to be twelve decayed gentlemen of the army and navy, and the three learned professions. They were to inhabit and be maintained in the hall, with L.30 apiece to spend per annum; and the park, with forty head of deer in it, was to be kept up for ever for their use. No condition that we know of was annexed to these munificent privileges, except the arduous one of attending daily service in the chapel. The vicar of the parish was to be the warden; but, notwithstanding these proofs of religious feeling, Charles Tancred decreed further—perhaps from modesty, or a disinclination to the society of worms—that his body should never be buried, but should remain for a sweet savour perpetually in the abode of his ancestors.

The will was at first strictly carried out; the gallant,

reverend, and learned trustees took possession, peopled the hall with decayed gentlemen as required, and set the thing fairly agoing. How strange and how pleasant for that primeval twelve, when they first assembled in the hall, beneath the pendent coffin of their founder! If that was a *memento mori* to them, it was one of the jolliest kind, and the sight of it must have soothed the rancorous recollections of any jilted bachelor among them; for was it not through the conduct of that abominable female that they were here—joint-lords of a fine estate, with no bothering steward or teasing tenants to annoy—jovial monks without a cloister, enjoying all the comforts, and bound by none of the vows of Bolton or of Rivaux? Lucky for them that they had passed the frantic heats of youth; for the warden was an easy abbot; night after night they toddled down to his cosy parsonage, and talked with him over the port of Mr Garrick, and the young king, who could actually speak English; day after day they toddled into the village, and drank their home-brewed at the Tancred Arms, and patted the little Gurths on the head as they ran out wondering at the funny old gentlemen who had come to live at the hall. And in summer-time, how tranquilly they smoked their noon-day pipes upon the lawn terrace! how benignantly they gazed out on the park—their own park, where the forty head of deer were continually performing feats of agility for their amusement!

Yes, they had a pleasant life of it; but alas! even twelve old gentlemen of the first respectability cannot always dwell together in peace. One may be a soldier, a doctor, or even a lawyer, without quite fulfilling a perfect morality; and besides, if philosophy had gone so far north, it might have discovered that these lay-brethren wanted above all things a *principle*. *Principal* won't do alone; you must spell it with an *e*, my friends, if you want to bind men together in any other bonds than those of kindred. Could you expect the fogies at White's to live in harmonious unity from morning to night, even under the auspices of an exclusive and aristocratic committee?

And so it came to pass that there arose strifes and dissensions in the fraternity. They chose a purveyor, and then quarrelled with him about the soup; they grudging one another the chief places in chapel, and the uppermost seats at dinner; they thought it strange when the warden shewed, as he sometimes did, that their nightly visits to the parsonage were becoming a bore. Oh, had there been but an Uncle Toby among them, to trace out ravelins and counterscarps in the orchard, and make a few timely breaches in the garden-wall! Yet even he would have had some unsympathising Shandy to annoy him; Bulkhead, R.N., would have demolished his works with a broadside of coarse invective, or the Rev. Growley Brimston would have shewn him that such amusements were no fit preparation for another world. And there were fears without as well as fightings within; lawsuits, promoted by the envy of disappointed collaterals, arose from time to time; and though they invariably terminated in favour of justice and the hospital, it was not pleasant, meanwhile, for the twelve old men whose comforts were at stake. At length, too, the glorious nineteenth century appeared, and the goddess of retrenchment shewed her clipped pinions to an admiring world. Even in Yorkshire, she was seen at last; and the trustees began to ask what was the use of keeping up the forty head of deer, and of maintaining a whole park for the use of fellows who could hardly crawl beyond the garden-door.

So they got an act of parliament—entitled an act for the regulation of attorneys and solicitors, and for improving the breed of horned cattle, and for other purposes—whereby the poor animals were instantaneously converted into venison for the million, and the broad old park was cleared, and hedged, and ploughed into fields, or else invaded by hordes of manful

cows and ignominious porkers. Bulkhead, R.N., and the Rev. Growley Brimston, were not sentimental, fortunately; but poor old M'Muller, the broken-down physician, was heard to say with a sigh that he wished the horns of the deer were in the belly—*abdomen* we call it now-a-days—of the trustees. However, the storm blew over the tea-cup: a new generation arose which knew not the deer-park; and all went well and smoothly till an event occurred which had well-nigh robbed Tancred Hall of its palladium, and done more than those impoverished collaterals to ruin and disperse the brethren.

After hanging in chains for many a long year from the roof of his own hall, the founder's body was removed into the chapel, there to be an object of affectionate solicitude to his protégés, and to point an effective moral from the pulpit just above. But familiarity did not breed respect; and, whether it were to gratify the senses or the feelings, poor Charles Tancred's coffin was again disturbed, and he was consigned to an open vault in one of the cellars, to sleep in peace till doom.

One day, however—and not very long ago either—the water of the household well was found to possess a new and peculiar flavour. Most of the brethren were acquainted with the neighbouring waters of Harrogate: was it possible that they were to possess in their own yard a constant supply of that delightful beverage? Alas! experience soon checked the pleasing thought; and then the warden, looking round for explanation, remembered with horror—*THE COFFIN*!

Yes, coffins are not quite impervious; and we have all of us, especially after death, a tendency to ooze and fritter into our kindred earth; and so it was that truth and Tancred were found in solution at the bottom of the well. Why not, indeed, when, as is well known, the dust of Cæsar was used for stopping bungholes? It was easy to dig a new well, and place the body elsewhere; but our friend the warden wisely determined to seize the moment of disgust, and remove for ever what he justly thought a scandal to his parish. 'This poor spirit,' said he, 'has been wandering a full century on the shore of Styx; let us charitably ferry it over, and lay it gently within the prayerful shades.' 'By all means,' wrote the trustees in reply: 'the nineteenth century is with us, and we perfectly agree with you; let it be done at once.'

Great was the excitement through the whole countryside when it became known that Squire Tancred, who died a hundred years ago, and had been above-ground ever since, was to lie in state in the old hall that night, and be buried like a Christian on the morrow. From hall, and farm, and cottage, they came in troops to see the wonder; and well they might, for truly it was what Rembrandt should paint and Hamlet's soul interpret. In a new coffin—for the old one had fallen in pieces—beneath a new velvet pall, and upon a new black bier, lay that strange superannuated corpse: above it was a glare of torches, driving back the darkness into far-off ghostly corners; around it, a whispering crowd, whose grandfathers were children when it ceased to live. Where were the tender women who closed those shrunken eyes, and folded that ragged ancient shroud? Where were the strong men who carried him out from this very house just a century ago, and left him alone with darkness in the church? Where were the mourners who should follow him to that church again to-morrow, and weep as they laid him in the moist bosom of our mother? The last of the Tancreds lay dead in his own mansion, and not one of those around him had ever seen his face, or possessed, by blood or friendship, the slenderest clue of sympathy to link them with his life.

So great a gulf is there between us and our great-grandfathers—so soon does affection transfer itself from our own progenitors to those who are the

intellectual ancestry of our age. Think you that your descendants will care at all for you as they will for Tennyson or Carlyle? And this man, in the midst of his own dependents, in the centre of his own domain, found but one friend wise enough to save his body from the miserable outlawry to which he had condemned it; and that friend was the village pastor. Truly, as saith the prophet, the sight was 'significant of several things.'

But while the throng of silent rustics was passing through the hall, confused between awe and curiosity, where were the brethren of the hospital?

When Tancred's buried, and not till then,
The heir shall have his own again.

So ran the legend, which was whispered around the bier; and our friends, of all men, were least likely to forget it. The body of their founder was like to prove a Patroclus to these worthy Trojans; and they were at that moment assembled in secret conclave overhead, devising means for getting it out of the hands of the enemy, and defeating the odious machinations of their warden. No one had missed them at such a time; but it mattered not, for the poor old fellows had outlived both wit and energy, and could only storm and bluster at an inevitable fate. At last the eventful morning came; the brethren sat apart in their rooms up stairs, waiting sullenly for the close of a ceremony which was to exorcise them into an unkind world once more; whilst the warden, in hood and surplice, stood ready in the hall, satisfied and cheerful. All was tranquil and triumphant; the grave had been dug, and the old sexton, whose grandfather tolled the bell for this very corpse a hundred years ago, was tolling for it now; in half an hour, the mouldering remains of Charles Tancred would be safe.

Already the clerk had marshalled the funeral procession, with the vicar and himself at its head; already the villagers had formed in line along its route; the bearers were just setting their shoulders to the coffin, and all was in act to move, when, hold! the hall-door bursts open, and enter in hot haste a messenger of that *Deus ex machina* the electric telegraph.

'We have read the will again, and taken counsel's opinion; and the burial *must not* take place.' The warden's voice quivers as he reads these words aloud to the assembly. Man's will, not God's, must be done!

The corpse returns self-condemned to its cellar; the good vicar goes sorrowing home; the crowd slink away in a fresh wonder, or stay behind to gossip with the sexton as he fills up the empty grave; whilst the brethren emerge victorious from their cells, and subside once more—who knows for how long?—into the calm security of their *status quo*.

A WOMAN'S THOUGHTS ABOUT WOMEN.

FEMALE PROFESSIONS.

GRANTED, the necessity of something to do, and the self-dependence required for its achievement, we may go on to the very obvious question—*what is a woman to do?*

A question more easily asked than answered; and the numerous replies to which, now current in book, pamphlet, newspaper, and review, suggesting everything possible and impossible, from compulsory wifehood in Australia, to voluntary watchmaking at home, do at present rather confuse the matter than otherwise. No doubt, out of these 'many words,' which 'darken speech,' some plain word or two will one day take shape in action, so as to evolve a practical good. In the meantime, it does no harm to have the muddy pond stirred up a little; any disturbance is better than stagnation.

These Thoughts—however desultory and unsatisfactory, seeing the great need there is for deeds rather than words—are those of a 'working' woman, who has been such all her life, with opportunity of comparing the experience of other working women with her own; she therefore at least escapes the folly of talking about what she does not know.

Female professions, as distinct from what may be termed female handicrafts, which merit separate classification and discussion, may, I think, be thus divided: the instruction of youth; art; literature; and the vocation of public entertainment—including actresses, singers, musicians, and the like.

The first of these, being a calling universally wanted, and the easiest in which to win, at all events, daily bread, is the great chasm into which the helpless and penniless of our sex generally plunge; and this indiscriminate Quintus Curtianism, so far from filling up the gulf, widens it every hour. It must be so, while young women of all classes and all degrees of capability rush into governing much as young men enter the church, because they think it a 'respectable' profession to get on in, and are fit for nothing else. Thus, the most important of ours, and the highest of all men's vocations, are both degraded—in so far as they can be degraded—by the unworthiness and incompetency of their professors.

If, in the most solemn sense, not one woman in five thousand is fit to be a mother, we may safely say that not two out of that number are fit to be governesses. Consider all that the office implies: very many of a mother's duties, added to which, considerable mental attainments, firmness of character, good sense, good temper, good breeding; patience, gentleness, loving-kindness. In short, every quality that goes to make a perfect woman, is required of her who presumes to undertake the education of one single little child.

Does any one pause to reflect what a 'little child' is? Not sentimentally, as a creature to be philosophised upon, painted and poetised; nor selfishly, as a kissable, scoldable, sugar-plum-feedable plaything; but as a human soul and body, to be moulded, instructed, and influenced, in order that it likewise may mould, instruct, and influence unborn generations. And yet, in face of this awful responsibility, wherein each deed and word of hers may bear fruit, good or ill, to indefinite ages, does nearly every educated gentlewoman, thrown upon her own resources, nearly every half-educated 'young person' who wishes by that means to step out of her own class into the one above it, enter upon the vocation of a governess.

Whether it really is her vocation, she never stops to think; and yet, perhaps in no calling is a personal bias more indispensable. For knowledge, and the power of imparting it intelligibly, are two distinct and often opposite qualities; the best student by no means necessarily makes the best teacher: nay, when both faculties are combined, they are sometimes neutralised by some fault of disposition, such as want of temper or of will. And allowing all these, granting every possible intellectual and practical competency, there remains still doubtful the moral influence, which, according to the source from which it springs, may ennoble or corrupt a child for life.

All these are facts so trite and so patent, that one would almost feel it superfluous to state them, did we not see how utterly they are ignored day by day by even sensible people; how parents go on lavishing expense on their house, dress, and entertainments—everything but the education of their children; sending their boys to cheap boarding-schools, and engaging for their daughters governesses at L.20 a year, or daily tuition at sixpence an hour; and how, as a natural result, thousands of incapable girls, and ill-informed, unscrupulous women, go on professing to teach everything under the sun, adding lie upon lie, and meanness

upon meanness—often through no voluntary wickedness but sheer helplessness, because they must either do that or starve!

Yet, all the while we expect our rising generation to turn out perfect; instead of which we find it—what?

I do solemnly aver, having seen more than one generation of young girls grow up into womanhood—that the fairest and best specimens of our sex that I have ever known, have been those the least indebted to, or familiar with, either schools or governesses.

Surely such a fact as this—I put it to general experience, whether it is not a fact?—indicates some great flaw in the carrying out of this large branch of women's work. How is it to be remedied? I believe, like all reformations, it must begin at home—with the governesses themselves.

Unless a woman has a decided pleasure and facility in teaching, a thorough knowledge of everything she professes to impart, a liking for children, and above all, a strong moral sense of her responsibility towards them, I hold that for her to enrol herself in the schoolmistress order is absolute profanation. Better turn shopwoman, needlewoman, lady's-maid—even become an honest housemaid, and learn how to sweep a floor, than sell her own soul, and peril many other souls by entering upon what is, or ought to be, a female 'ministry,' unconsecrated, and incapable of the work.

If capable, doubtless she will find it. Not easily, alas! nor soon; but she will find it; for conscientious attainments rarely fail in the long-run to obtain their end. There is no influence so deeply felt in a home, or so anxiously kept, if only for self-interest, as the influence of a good governess over the children. And as in most social questions, where to theorise is easy and to practise very difficult, I think it will be found that the silent remedying of an evil is safer than the loud outcry against it. If every governess, so far as her power extends, would strive to elevate the character of her profession by elevating its members, many of these acknowledged wrongs and miseries of governess-ship would gradually right themselves. A high standard of capability would weed out much current mediocrity; and, competition lessened, the value of labour would rise. I say 'the value of labour,' because, when we women do work, we must learn to rate ourselves at no ideal and picturesque value, but simply as *labourers*—fair and honest competitors in the field of the world; and our wares as mere merchandise, where money's worth alone brings money, or has the right to bring it.

This applies equally to the two next professions, art and literature. I put art first, as being the more difficult—perhaps, in its highest form, almost impossible to women. There are many reasons for this, in the long course of study necessary for a painter, in the unnatural repugnance of 'society' to women's dress, from 'the life,' attending anatomical dissections, and so on—all of which are indispensable to one who would plumb the depths and scale the heights of the most arduous of the liberal arts. Whether any woman will ever do this, remains yet to be proved. Menial, many lower and yet honourable positions, are open to female handlers of the brush.

But in literature, we own no such boundaries; we meet men on level ground—and, shall I say it?—do often beat them in their own field. We are as historians, as clear explanators of science, as novelists, almost—except for Thackeray—and even in the last year we have proved that we can write a great poem as any man among them all. The publisher's list, any handful of weekly or monthly periodicals, can testify to our power of entering heartily on the literary profession, and pursuing it wholeheartedly, and self-reliantly, thwarted by no hindrance and content with no height short of the highest.

So much for the best of us—women whose work will cut down the ages, safe and sure; there is no need to seek of it or them. But there is another secondary class among us, neither 'geniuses' nor ordinary women—aspiring to both destinies, and usually achieving either: of these it is necessary to say a word.

In any profession, there is nothing, short of being violently evil, which is so injurious, so fatal, as mediocrity. To the amateur who writes 'sweetly' or paints 'prettily,' her work is mere recreation; and though it may be less improving for the mind to do small things on your own account, than to be satisfied with appreciating the greater doings of other people, still, it is harmless enough, if it stops there. But all who leave domestic criticism, to plunge into the open arena of art—I use the word in its widest sense—must abide by art's severest laws. One of these is, that every person who paints a common-place picture, writes a mediocre book, contributes temporarily—happily, only temporarily—to lower the standard of public taste, fills unworthily some better competitor's place, and without achieving any private good, does a positive wrong to the community at large.

One is often tempted to believe, in the great influx of small talents which now deluges us, that if half the books written, and pictures painted, were made into one great bonfire, it would be their shortest, easiest, and safest way of illuminating the world.

Therefore, let men do as they will—poor fellows, they are often ten times vainer and more ambitious than we!—but I would advise every woman to examine herself and judge herself, morally and intellectually, by the sharpest canons of criticism before she attempts art or literature, either for abstract fame or as a means of livelihood. Let her take to heart, humbly, the telling truth, that

Fools rush in where angels fear to tread,

and be satisfied that the smallest perfect achievement is nobler than the grandest failure. But having, after mature deliberation, chosen her calling, and conscientiously believing it is her calling—that in which she shall do most good, and best carry out the aim of her existence—let her fulfil to the last iota its solemn requirements.

These entail more, much more, than flighty young genius or easy-satisfied mediocrity ever dreams of: labour incessant, courage inexhaustible, under difficulties, misfortunes, and rebuffs of every conceivable kind—added thereto not unfrequently the temperament to which these things come hardest. *Le génie est la patience*; and though there is a truth beyond, since all the patience in the world will not serve as a substitute for genius, still, never was a truer word spoken than this of old Buffon's. Especially as applied to women, when labourers in a profession which demands from them, no less than from men, the fervent application, and sometimes the total devotion of a lifetime.

For, high as the calling is, it is not always, in the human sense, a happy one; it often results in, if it does not spring from, great sacrifices; and is full of thousand misconstructions, annoyances, and temptations. Nay, since ambition is a quality far oftener deficient in us than in the other sex, its very successes are less sweet to women than to men. Many a 'celebrated authoress' or 'exquisite paintress' must have felt the heart-truth in *Aurora Leigh*:

I might have been a common woman, now,
And happier, less known and less left alone,
Perhaps a better woman after all—
With chubby children hanging round my neck,
To keep me low and wise. Ah me! the vines
That bear such fruit are proud to stoop with it—
The palm stands upright in a realm of sand.

And, setting aside both these opposite poles of the female character and lot, it remains yet doubtful whether the maiden-aunt who goes from house to house, perpetually busy and useful—the maiden house-mother, who keeps together an orphan family, having all the cares, and only half the joys of maternity or mistress-ship—even the active, bustling 'old maid,' determined on setting everybody to rights, and having a finger in every pie that needs her, and a few that don't—I question whether each of these women has not a more natural, and therefore happier existence, than any 'woman of genius' that ever enlightened the world.

But happiness is not the first nor the only thing on earth. Whosoever has entered upon this vocation in the right spirit, let her keep to it, neither afraid nor ashamed. The days of blue-stockings are over: it is a notable fact that the best housekeepers, the neatest needlewomen, the most discreet managers of their own and others' affairs, are ladies whose names the world cons over in library lists and exhibition catalogues. I could give them now—except that the world has no possible business with them, except to read their books and look at their pictures. It must be something deficient in the women themselves, if the rude curiosity of this said public is ever allowed to break in upon that dearest right of every woman—the inviolable sanctity of her home.

Without—in these books and by these pictures—let it always be a fair fight, and no quarter. To exact consideration merely on account of her sex, is the poorest cowardice. She has entered the neutral realm of pure intellect—has donned brain-armour, and must carry on with lawful, consecrated weapons a combat, of which the least reward in her eyes, in which she never can freeze over or burn out either woman-tears or woman-smiles, will be the public acknowledgment called Fame.

This Fame, as gained in art or literature, is certainly of a purer and safer kind than that which falls to the lot of the female *artiste*.

I believe that no human gift is given to be hid under a bushel; that a Sarah Siddons, a Rachel, or a Jenny Lind, being created, were certainly not created for nothing. There seems no reason why a great actress or vocalist should not exercise her talents to the utmost for the world's benefit, and her own; nor that any genius, boiling and bursting up to find expression, should be pent down, cruelly and dangerously, because it refuses to run in the ordinary channel of feminine development. But the last profession, of the four which I have enumerated as the only paths at present open to women, is the one which is the most full of perils and difficulties, on account of the personality involved in its exercise.

We may paint scores of pictures, write shelves-full of books—the errant children of our brain may be familiar half over the known world, and yet we ourselves sit as quiet by our chimney-corner, live a life as simple and peaceful as any happy 'common woman' of them all. But with the *artiste* it is very different; she needs to be constantly before the public, not only mentally, but physically; the general eye becomes familiar, not merely with her genius, but her corporeality; and every comment of admiration or blame awarded her, becomes necessarily an instant and personal criticism. This of itself is a position contrary to the instinctive something—call it reticence, modesty, shyness—what you will—which is inherent in every one of Eve's daughters. Any young girl, standing before a large party in her first *tableau vivant*—any singing-pupil at a public examination—any boy-lover of some adorable actress, at the moment when he first thinks of that goddess as *his wife*, will understand what I mean.

But that is by no means the chief objection; for the

feeling of personal shyness dies out, and, in the true artiste, becomes altogether merged in the love and inspiration of her art—the inexplicable fascination of which turns the many-eyed gazing mass into a mere 'public,' of which the performer is individually no more conscious than was the Pythoness of her curled and scented Greek auditors, when she felt on her tripod the coming of the unconquerable, inevitable god. The saddest phase of artiste-life—which is, doubtless, the natural result of this constant presence before the public eye, this incessant struggle for the public's personal verdict—is its intense involuntary egotism.

No one can have seen anything of theatrical or musical circles without noticing this—the incessant recurrence to 'my part,' 'my song,' 'what the public think of me.' In the hand-to-hand struggle for the capricious public's favour, this sad selfishness is apparently inevitable. 'Each for himself' seems implanted in masculine nature, for its own preservation; but when it comes to 'each for herself'—when you see the fairest Shakespeare heroines turn pale at the name of a rival impersonator—when Miss This cannot be asked to a party for fear of meeting Madame That, or if they do meet, for all their harmony and smiles, you perceive their backs are up, like two strange cats meeting at a parlour-door—I say, this is the most lamentable of all results, not absolutely vicious, which the world, and the necessity of working in it, effect on women.

And for this reason, the profession of public entertainment, in all its gradation, from the inspired *tragedienne* to the poor chorus-singer, is, above any profession I know, to be marked with a spiritual Humane Society's pole, 'Dangerous.' Not after the vulgar notion: we have among us too many chaste, matronly actresses, and charming maiden-vocalists, to enter now into the old question about the 'respectability' of the stage; but on account of the great danger to temperament, character, and mode of thought to which such a life peculiarly exposes its followers.

But, if a woman has chosen it—I repeat in this as in any other—let her not forego it; for in every occupation, the worthiness, like the 'readiness,' 'is all.' Never let her be moulded by her calling, but mould her calling to herself; being, as every woman ought to be, the woman first, the artiste afterwards. And, doubtless, so are many; doubtless one could find, not only among the higher ranks of this profession, where genius itself acts as a purifying and refining fire, but in its lower degrees, many who, under the glare of the footlights and the din of popular applause, have kept their freshness and singleness of character unfaded to the end. Ay, even among poor ballet-dancers, capering with set rouged smiles and leaden hearts—coarse screaming concert-singers, doing sham pathos at a guinea a night—flaunting actresses-of-all-work, firmly believing themselves the best Juliet or Lady Macbeth extant, and yet condescending to take ever so small a part—even the big-headed 'princess' of an Easter extravaganza, for the sake of the old parents, or the fiddler-husband and the sickly babies at home. No doubt, many of them live—let us rather say endure—a life as pure, as patient, as self-denying, as that of hundreds of timid, daintily protected girls, and would-be correct matrons, who shrink in safe privacy from the very thought of these. But Heaven counts and cares for all.

Therefore, in this perilous road, double honour be unto those who walk upright, double pity unto those who fall!

Conning over again these desultory Thoughts, it seems to me they all come to neither more nor less than this: that since a woman, by choosing a definite profession, must necessarily quit the kindly shelter and sweet negativeness of a private life, and assume a substantive position, it is her duty not hastily to decide, and before deciding, in every way to count the cost. But having

chosen, let her fulfil her lot, and keep to it. No hesitations, no regrets, no compromises—they are at once cowardly and vain. She may have missed or foregone much;—I repeat, our natural and happiest life is when we lose ourselves in the exquisite absorption of home, the delicious retirement of dependent love; but what she has, she has, and nothing can ever take it from her. Nor is it, after all, a small thing for any woman—be she governess, painter, author, or artiste—to feel that, higher or lower, according to her degree, she ranks among that crowned band who, whether or not they are the happy ones, are elected to the heaven-given honour of being the Workers of the world.

A GLIMPSE OF SARAWAK.

ON the 11th of August 1852, I embarked at Singapore in a small trading-schooner bound for Sarawak; and aided by a favourable breeze and a rapid tide, we were soon carried past the verdant shores of the Straits of Malacca, into the China Sea, across which we stretched direct for Borneo. After four days' sail, the outlines of the mountains of that island appeared in the distant horizon, blue and bright through the clear atmosphere, gradually rising up from the water, and darkening in colour, and shewing more clearly their spurs and valleys as we closed in with the land. Next appeared the low level coast-line, black with the forests of centuries, whose dark and heavy verdure stretched in unbroken mass over the whole face of the country, far away over and beyond the tops of the highest and most distant mountains. As we passed along, the coast-line was seen to be occasionally broken by the mouths of large rivers, which discharge their waters through gaps in the ceaseless and apparently impenetrable jungle, and which, by their broad and stately streams, afford access to the interior of the country. We were becalmed for some time off Cape Datu—a high bold promontory that projects far into the sea—till, a heavy squall coming down from the top of the bluff, necessitated a rapid reduction of sail, but bore us at the same time gallantly over the waves. As the night closed in, the clouds gathered in masses, but the almost incessant play of sheet-lightning around the horizon afforded a sufficiency of light by which to continue our course; and about midnight we cast anchor off the Santubong entrance of the Sarawak river.

Next morning the weather was stormy and heavy, but unpropitious as the day was, it gave us a favourable idea of the picturesque character of the country. On one side of the river, close to its mouth, and close also to the beach, Santubong mountain shot up almost perpendicularly to the height of nearly 3000 feet, stretching away seaward in a long irregular, broken, and picturesque range, and terminating in a bold bluff cape, round whose base the waters of the China Sea heaved and broke. On the other side rose a lower and less striking hill, between which and Santubong the river opened, like the open gate of an avenue, inviting us to explore the country. There we entered with the flood-tide, and in due time arrived at Kuching, the capital of the world-famed Sarawak.

I do not intend to repeat the story—so well known through the works of Captains Keppell and Munro—of the manner in which Sir James Brooke became rajah of Sarawak; I may, however, be permitted to give the following illustration of the cool climate

in which he looks danger in the face, and prepares against it.

When Mr Brooke first arrived at Kuching in the *Royalist*, he landed and paid his respects to Muda Hassim, the Malay rajah of the place; and in return invited that prince, with several of his nobles and their followers, to visit him on board his yacht. I have shared in the surprise which I have often heard expressed, that Mr Brooke should have invited on board his yacht a Malay prince and his followers, of whom he knew comparatively nothing, except that they belonged to a race whose name is synonymous in the east with ferocity, treachery, and blood-thirstiness, and who, wherever they are known, are noted for their addiction to piracy. It is true, they are by no means so bad as they are represented to be; and it is equally true that they possess many fine qualities, which are discovered upon closer acquaintance; but still the general character they bear, and by which alone Mr Brooke could have known them, is that of treacherous pirates. Mr Brooke, however, resolved to return Muda Hassim's hospitality, without exhibiting either fear or suspicion, while at the same time he took effectual measures to baffle any attempt at treachery, should such be made. On deck, the crew were drawn up under arms, acting ostensibly as a guard of honour to receive the prince, but prepared for hostilities in case of necessity; while at the same time, the ship's guns were loaded with grape, and trained so as to sweep the deck at the first discharge. In the cabin, where Mr Brooke was to receive his visitors, he was seated on a sofa with a broad table placed before him, in order to prevent any sudden stab with a kris, and under the pillow, which lay carelessly beside him, a pair of loaded pistols were concealed. Above the sofa, a large mirror was placed, and behind the mirror were stationed four men, each with four loaded muskets, who on a given signal were to throw down the mirror, and shew themselves armed. Thus fortified, Mr Brooke sat at his ease, and received his distinguished visitors with gentlemanly courtesy. No attempt at violence was made; and Muda Hassim remained till the day of his death ignorant of the precautions taken against his possible treachery.

On another occasion, after the present Sarawak government was established, a chief of the Sarebas Dyaks, by name Lingire, made an attempt to take Mr Brooke's head. He came to Sarawak with several war-boats, ostensibly to pay a visit to the Malay *datus* or magistrates of that place, and moored his boats in the river opposite their campongs, a few hundred yards above Rajah Brooke's house. At length, one night when the tide suited his purpose, he dropped silently down the river to the rajah's wharf, fastened his boats there, and landed with eighty armed men. He then walked up to the house, entered the hall where the rajah was seated at dinner entertaining all the European inhabitants of the settlement, and his men, placing themselves in a semicircle around the table, squatted down, intending to spring upon their victims in the confusion of clearing away the dinner. As soon as Mr Brooke saw Lingire enter with so many men, he suspected his object, and calling a Malay servant who fortunately understood English, he ordered him to cross the river and tell the *datus* to bring over their men as quickly as possible. This being spoken in English, was not understood by the Dyaks, who, thinking that the rajah had merely given some order about the dinner, saw the servant leave the room without suspicion, and sat still, quietly and intently surveying the scene before them, and waiting the signal of attack from their chief. In the meantime, the Europeans continued their dinner with the best appetite they could, and knowing that their safety depended on their prolonging the meal as much as

possible, they were in no hurry to conclude it. From the painful state of suspense in which they were held, they were at length delivered by the arrival of the *Datu Tumang-gong*—a brave old pirate who, in his day, has carried on his depredations within sight of Singapore—who entered the room at the head of thirty Malays. He at once placed himself between the Europeans and Dyaks; and turning upon Lingire, he applied to him many epithets the reverse of complimentary, told him that he knew what he had come for, and ordered him instantly to go down to his boats. The Dyak paused; the odds were eighty to thirty, and he seemed inclined to try the chances of a combat; but while he hesitated, the *Datu Bandar* entered with fifty men, and he then slunk off to his boats like a beaten dog. When he arrived at Sarebas, he gave it out publicly that his object was to have taken the rajah's head, and he further expressed his determination still to have it; nay, he even went so far as to make a basket for the special purpose of containing it after it should be captured. He now appears, however, to have thought better of the matter; for when I last saw him, he was seated at the rajah's table, talking and laughing and drinking arrack.

The Sarawak territory, as seen from the sea, presents a long low dark coast-line, covered with trees to the water's edge, and occasionally intersected by the mouths of rivers, or broken by bold rocky promontories that project far into the sea. Behind the coast-line, the ground rises in many places into hills and mountains, some of them round and swelling, and covered, like all the rest of the country, with dark jungle; others abrupt and craggy in the extreme, with trees and bushes shooting from every crevice, and creepers and parasites hanging from every cliff and from every tree.

On entering one of the rivers which cleaves its way through the apparently impenetrable jungle, the traveller finds himself in a wide open channel, both sides of which are crowded with the same dark and heavy foliage that covered the coast, and which, not content with the possession of the land, seems to aspire to that of the water too, by sending forests of mangroves far into the river. In other parts, the banks are lined by thousands of nipa palms, whose long bending leaves, fringed with their dark and sharp-pointed leaflets, wave gracefully in the breeze, forming the foreground of the mighty jungle that towers up behind. Higher up the river, where the banks are no longer swampy, the mangroves and nipas disappear, but the primeval forest still continues in undiminished and unchanging magnificence; and as the silent stream bears us swiftly onwards over its still and placid waters, glowing with the tints of a tropical evening sky, we pass point after point, and traverse reach after reach, each bank and every change of scene presenting the same wild and lonely grandeur and luxuriance. If a pigeon flies overhead, a monkey leaps from a bough, or the loud and discordant note of some feathered denizen of the forest rings through the air, it is the only sign of life the vast jungle exhibits, except the shrill chirping of the tree grasshoppers which have commenced their evening-song, or the irritating attacks which compel attention to the existence of sand-flies and mosquitoes.

As we ascend the river above the influence of the tides, the channel, though it still continues deep, becomes very narrow, and often appears almost over-arched by the vegetation which clothes its banks. Not only do enormous trees shoot up their giant forms to the height of hundreds of feet, but the margin of the river between the trees and the stream itself is lined with a dense mass of vegetation, as thick and impenetrable, and ten times as high, as a quickset-hedge. One of the most remarkable of the plants that form this fringe to the margin of the stream, is called by the

Dyaks *mudiang*, and exactly resembles the plant of the pine-apple, only that it grows upon a stem some twenty feet high. Its fruit, also, has much the appearance of the pine-apple, but is hard and woody within, and utterly unfit for food. These plants grow in great numbers in the mud that forms the margin of the stream, and are the resort of troops of monkeys, which leap, grin, and chatter among them during the day, and at night hang asleep upon them within oars-length of the passing boat.

Higher up the river still, it again changes its appearance; instead of being deep and muddy, it becomes shallow and clear, assuming to a considerable extent the character of a mountain stream. The bottom is sandy or stony, and the fish are seen playing in the pools; the banks are dry and free from mud, allowing the large trees of the jungle to spring up from the margin of the stream, and to interlace their gigantic branches high overhead. Then it is that the forest is seen in all its beauty and grandeur. Tall trunks, straight as an arrow, support the unbroken shade of verdure which clings to their boughs, while long and fantastic creepers embrace the vast columns with their tangled net-work, and hang like festoons from one to another. Occasionally, accident may have cleared a considerable space along the banks, leaving one vast tree standing in comparative solitude, and then is seen the monarch of the forest in all his glory. A vast, massive trunk rises straight as a ship's mast, and without a single branch, to the height of 200 feet or more; and from the top of this gigantic column, diverge the spreading branches, covered with their heavy masses of dark-green foliage, the whole forming as fine an object as the eye can rest on.

Sometimes these large trees are found in inconvenient proximity to the traveller: they fall across the stream, and bar his progress. If the trunk is immersed so deeply as that there are three or four inches of water on any part of it, the canoe is unloaded, and the crew, jumping into the water, drag her over the impediment; while if it happens to be resting at a height of five or six inches above the surface of the stream, she is again unloaded, and pushed underneath it.

As the trees seldom fall perfectly flat across the surface of the water, one or other of these methods of passing them is generally practicable; but sometimes neither of them can be followed, in which case, there is no other resource than the laborious and tedious process of cutting the trunk through. As there are also shallows and rapids, as well as logs of wood in the rivers, it will easily be imagined that ascending these smaller streams is a toilsome method of journeying; and so numerous are impediments of one kind or another, that I have sometimes seen the crew wading or swimming continuously for several hours.

I have thus endeavoured to give an idea of the country as seen in going up one of the large rivers. I shall now ask the reader to take a walk with me into the jungle. Jungle is of two kinds—old and young. Old jungle is simply the forest, young jungle is the vegetation which springs up wherever old jungle has been cut down. It consists of a dense mass of grass, reeds, and bushes, impervious to man; and when necessity compels him to take his course through it, he must cut his way with his *parang* or chopping-knife, hewing out a path as he goes along. Walking in old jungle, however, is very different. There, there is comparatively little underwood; the ground is moist and soft with decaying leaves; the air is cool and pleasant; and the enormous trees whose foliage completely keeps off the sun, form a 'leafy labyrinth' of the most imposing and extensive dimensions. Every tenth tree is a giant, whose vast stem, straight as a ship's mast, shoots up aloft till its almost undiminished diameter is hid by the foliage of those around it, and from the visible height of the lower trees which conceal

its top, we are left to imagine the size of the higher. Some of them are covered with the strangest-looking creepers and parasites which clothe the stem and festoon the boughs; and occasionally we come to a tree in full flower, which, if it be partially isolated, so as to admit of its being seen from below, affords one of the most beautiful spectacles which the vegetable creation can present. Altogether, though the general appearance of the forest is, except as regards the size of the trees which compose it, very much like that of a wood at home, still the most cursory examination will not fail to shew something very unlike any of the vegetable productions of the temperate zone. Perhaps, however, one of the most striking features of the jungle is the almost entire absence of animal life which it displays—an absence perfectly surprising to the European visitor, who, from the jungle's being unfrequented and almost untrod by man, is prepared to find it filled with tenants of one kind or other. But no; he walks along amidst this luxuriance of vegetation, and scarcely sees an animal. Almost the only signs of life he discovers are the harsh cry of the hornbill, the plaintive wail of the *wawa* or long-armed ape, and loud but melancholy groaning of the *razang* or long-nosed monkey; or perhaps the sight of a lizard ascending the rough trunk of some vast tree, or a snake rustling among the fallen leaves or twining among the branches. It is true, that where there are many fruit-trees, the scene is different; there, troops of monkeys abound, and leap and sport among the boughs, now shaking the forest in very wantonness, again sitting gravely on some lower bough, grinning secure defiance on their two-legged brethren below, treating with majestic contempt the efforts of the Dyaks to frighten them, and gazing with the bliss of ignorance on the terrors of the gun. They are of many hues and of all sizes, from the orang-outang, whose body is as large as that of a tall man, to the smaller species of a span long. There are many birds, too, of different kinds, generally with harsh voices and brilliant plumage, which conceal themselves among the thick leaves, or flit away on too near an approach. Such assemblages of animals, however, are the exception; the rule in the forest is, as I have already stated, great luxuriance of vegetation, and great scarcity of animal life; and in this respect, Borneo at present, I should imagine, somewhat resembles the account given by geologists of England during the formation of the coal. If it be so, it is strange to find the state of our own island many thousand ages ago paralleled by the present state of another island many thousand miles distant.

There is yet another view of the country which I shall endeavour to present—namely, that witnessed from the summit of a lofty mountain. From such a position, as far as the spectator's eye can reach, he looks down upon a generally flat but somewhat undulating country, with hills of various forms and sizes scattered around, some of them round and swelling, some with sharp peaks and ridges, and some abrupt and craggy in the extreme, but all of them covered with the same dark and heavy verdure which overspreads the face of the country, except where some limestone cliff gleams through the mass of vegetation which elsewhere shrouds it. In the low ground, he sees the winding rivers pursuing their tortuous course through the unbroken forest, now appearing lustrous and silvery in the light, now red and muddy as they roll along almost at his feet, now buried in the tall trees which clothe their banks, and again reappearing at a distance brighter and more lustrous than ever. The vast expanse of forest spread out before him, induces ideas somewhat akin to those awakened by gazing on the ocean from a sea-side cliff. There is the same extent of prospect, the same monotony of scene, and the same feeling of solitude in the one

case as in the other; and this similarity of landscape induces a similarity of ideas, cutting off the soul, as it were, from immediate contact with his fellows, and opening it to the greatness and the majesty of that Power who created alike the ocean and the forest.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XCII.—COUP D'ŒIL OF THE CAMP.

For some minutes I stood motionless as a statue; I stirred neither hand nor foot, lest the movement should catch the eye either of the horse-guards or those moving around the fires. I had already donned my plumed head-dress, before climbing out of the channel: my first thought was to replace my pistols in the belt behind my back. The movement was stealthily made; and with like stealthy action, I suffered the mantle of jaguar-skins to drop from my shoulders, and hang to its full length. I had saved the robe from getting wet; and its ample skirt now served me in concealing my soaked breech-cloth as well as the upper half of my leggings. These and the moccasins were, of course, saturated with water, but I had not much uneasiness about that. In a prairie-camp, and upon the banks of a deep stream, an Indian with wet leggings could not be a spectacle to excite suspicion; there would be many reasons why my counterpart might choose to immerse his copper-coloured extremities in the river. Moreover, the buckskin—dressed Indian-fashion—was speedily casting the water; it would soon drip dry, or even if wet, would scarcely be observed under such a light.

The spot where I had 'landed' chanced to be one of the least conspicuous in the whole area of the camp. I was just between two lights—the red glare of the camp-fires, and the mellower beams of the moon; and the atmospheric confusion occasioned by the meeting of the distinct kinds of light favoured me, by producing a species of optical delusion. It was but slight, and I could easily be seen from the centre of the camp, but not with sufficient distinctness for my disguise to be penetrated by any one; therefore, it was hardly probable that any of the savages would approach or trouble their heads about me. I might pass for one of themselves indulging in a solitary saunter, yielding himself to a moment of abstraction or melancholy. I was well enough acquainted with Indian life to know that there was nothing *outré* or unlikely in this behaviour; such conduct was perfectly *en règle*.

I did not remain long on that spot—only long enough to catch the salient features of the scene. I saw there were many fires, and around each was grouped a number of human forms—some squatted, some standing. The night was cold enough to make them draw near to the burning logs; and for this reason, but few were wandering about—a fortunate circumstance for me.

There was one fire larger than the rest; from its dimensions, it might be termed a bonfire, such as is made by the flattering and flunkeyish peasantry of old-world lands when they welcome home the squire and the count. It was placed directly in front of the solitary tent, and not a dozen paces from its entrance. Its blazing pile gave forth a flood of red light that reached even to the spot where I stood, and flickered in my face. I even fancied I could feel its warmth upon my cheeks.

Around this fire were many forms of men—all of them standing up. I could see the faces of those who were upon its further side, but only the figures of these on the nearer. The former I could see with almost as much distinctness as if I had been close beside them; I could trace the lineaments of their features—the

painted devices on their breasts and faces—the style of their habiliments.

The sight of these last somewhat astonished me. I had expected to see red-skinned warriors in leggings, moccasins, and breech-cloth, with heads naked or plumed, and shoulders draped under brown robes of buffalo-skin. Some such there were, but not all of them were so costumed; on the contrary, I beheld savages shrouded in serapés and cloaks of broadcloth, with calzoneros on their legs, and upon their heads huge hats of black glaze—regular Mexican sombreros! In short, I beheld numbers of them in full Mexican costume!

Others, again, were dressed somewhat in a military fashion, with helmets or stiff shakos, ill-fighting uniform coats of red or blue cloth, oddly contrasting with the brown buckskin that covered their legs and feet.

With some astonishment, I observed these 'fancy dresses;' but my surprise passed away, when I reflected as to who were the men before me, and whence they had lately come; where they had been, and on what errand. It was no travesty, but a scene of actual life. The savages were clad in the spoils they had captured from civilisation.

I need not have been at such pains with my toilet; under any guise, I could scarcely have looked odd in the midst of such a motley crew: even my own uniform might have passed muster—all except the colour of my skin.

Fortunately, a few of the band still preserved their native costume—a few appeared in full paint and plumes—else I should have been *too Indian* for such a company.

It cost not a minute to note these peculiarities, nor did I stay to observe them minutely; my eyes were in search of Isolina.

I cast inquiring glances on all sides; I scrutinised the groups around the different fires; I saw others—women—whom I knew to be captives, but I saw not her.

I scanned their forms and the faces of those who were turned towards me. A glance would have been enough; I could easily have recognised her face under the firelight—under any light. It was not before me.

'In the tent—in the tent: she must be there?'

I hastened to move away from the spot where I had hitherto been standing. My eye, quickened by the necessity of action, had fallen upon the copse that covered the entire background of the camp. At a glance I detected the advantage offered by its shadowy cover.

The tent was placed close to the edge of the timber; and in front of the tent, as already stated, was the great fire. Plainly, this was the gravitating point—the centre of motive and motion. If aught of interest was to be enacted, there would lie the scene. In the lodge or near it would she be found—certainly she must be there; and there I resolved to seek her.

CHAPTER XCIII.

A FRIENDLY ENCOUNTER.

Just then the shrill voice of a crier pealed through the camp, and I observed an unusual movement. I could not make out what the man said, but the peculiar intonation told that he was uttering some signal or summons. Something of interest was about to transpire.

The Indians now commenced circling around the blazing pile, meeting and passing each other, as if threading the mazes of some silent and solemn dance. Others were seen hastening up from distant parts of the camp, as if to observe the actions of those around the fire, or join with them in the movement.

I did not wait to watch them; their attention thus occupied, gave me an opportunity of reaching the

copse unobserved, and, without further ado, I started towards it.

I walked slowly, and with an assumed air of careless indifference. I counterfeited the Comanche walk—not that bold free port—the magnificent and inimitable stride, so characteristic of Chippewa and Shawano, of Huron and Iroquois—but the shuffling gingery step of an English jockey, for such in reality is the gait of the Comanche Indian when afoot.

I must have played my part well. A savage, crossing from the horse-guards towards the great fire, passed near me, and hailed me by name:

‘Wakono!’ cried he.

‘Que cosa?’ (Well—what matter?) I replied in Spanish, imitating as well as I could the Indian voice and accent. It was a venture, but I was taken at a straight, and could not well remain silent.

The man appeared some little surprised at being addressed in the language of Mexico; nevertheless, he understood it, and made rejoinder.

‘You hear the summons, Wakono? Why do you not come forward? The council meets; Hissoo-royo is already there.’

I understood what was said, more from the Indian’s gestures than his speech, though the words ‘summons,’ ‘council,’ and the name ‘Hissoo-royo,’ helped me to comprehend his meaning. I chanced to know the Comanche epithets for the two first, and also that Hissoo-royo (the Spanish wolf) was the Indian appellation of the Mexican renegade.

Though I understood what was said, I was not prepared with a reply. I dared not risk the answer in Spanish; for I knew not the extent of Wakono’s proficiency in the Andalusian tongue.

I felt myself in a dilemma; and the importunate savage—no doubt some friend of Wakono himself—appeared determined to stick to me. How was I to get rid of him?

A happy idea came to my relief. Assuming an air of extreme dignity, and as though I did not wish to be disturbed in my meditations, I raised my hand and waved the man a parting salute: at the same time, I turned my head, and walked slowly away.

The Indian accepted the *congé*, and moved off, but evidently with an air of reluctance. As I glanced back over my shoulder, I could see him parting from the spot, with a hesitating step; no doubt somewhat astonished at the strange behaviour of his friend Wakono.

I did not look back again until I had placed myself under the shadow of the timber; then I turned to reconnoitre: my friend had continued on; I saw him just entering among the crowd that circled around the great fire.

Screened from observation by the shadow, I could now pause and reflect. The trifling incident that had caused me some apprehension, had also helped me to some useful knowledge: First, I had learned my own name; second, that a council was about to take place; and thirdly, that the renegade, Hissoo-royo, had something to do with the council.

This was knowledge of importance; combined with my previous information, everything was now made clear. This council could be no other than the jury-trial between the renegade and the yet nameless chief; the same that was to decide to which belonged the right of property in my betrothed. It was about to meet; it had not assembled as yet. Then had I arrived in time. Neither white savage nor red savage had yet come into possession; neither had dared to lay hand on the coveted and priceless gem.

Isolina was still safe—thus singularly preserved from brutal contact. These dogs in the manger, their mutual jealousy had proved her protection! I was consoled by the thought—strange source of consolation!

I was in time, but where was she? From my new

position I had a still better view of the camp, its fires, and its denizens. She was nowhere to be seen!

‘In the lodge, then—she must certainly be there—or’—A new thought occurred to me: ‘She may be kept apart from the other captives?—in the copse—she may be concealed in the copse until the sentence be pronounced?’

This last conjecture brought along with it hopes and resolves. I determined to search the copse. If I should find her there, my emprise would be easy indeed; at all events, easier than I had anticipated. Though guarded by the savages, I should rescue her from their grasp. The lives of six men—perhaps twice that number—were under my belt. The odds of unarmed numbers would be nothing against the deadly bullets from my revolvers, and I saw that most of the savages had laid aside their weapons, confident in the security of their camp.

But I might find her alone, or perhaps with but a single jailer. The meeting of the council favoured the supposition. The men would all be there—some to take part—others interested in the result, or merely from curiosity to watch the proceedings. Yes, all of them would have an interest in the issue—too surely all. The barbarous custom of these savage brutes at that moment came to my remembrance! I stayed no longer to reflect; but gliding into the grove, commenced my search for the captive.

The ground was favourable to my progress: there was not much underwood, and the trees grew thinly; I could easily pass amongst them without the necessity of crouching, and without making noise. The silent tread of the moccasin was in my favour, as also the dark shadowy foliage that stretched overhead, hiding the sky from my view.

The chief timber of the copse was the pecan hickory—almost an evergreen—and the trees were still in full leaf; only here and there, where the trunks stood far apart, did the moonbeams strike through the thick frondage. The surface of the ground was shrouded from her light, and the narrow aisles through which I passed were as dark as if no moon had been shining.

There was still light enough to reveal some horrid scenes. O Heaven! my heart bleeds at the remembrance.

I was wrong in my conjecture. The men had not all gone to the council; the captive women were not all by the camp-fires. I beheld ruffian men beside their helpless victims—women—fair white women—with drooping heads and listless air—diaveilled, weeping! O Heaven! my heart recoils at the remembrance!

It recoiled at the sight—it burned with indignation. At every turn did it prompt me to draw knife or pistol; at every step my fingers itched to immolate a hideous paint-besmeared brute—to slay a ‘savage.’

I was restrained only by my own desperate situation—by my apprehensions for the safety of Isolina, now more acute than ever. What horrid imaginings crowded into my brain, begot by the barbarous drama that was being enacted around me.

The monsters, too earnestly occupied with their captives, took no heed of me; and I passed on without interruption.

I threaded the pathways of the grove one after another, gliding through as rapidly as the path would permit; I entered every aisle and glade; I searched everywhere, even to the furthest limits of the wood. I saw more men—more weeping women—more ruffianism; I saw nought of her for whom I searched.

‘In the tent then—she must be there.’

I turned my face towards the lodge, and moving with stealthy step, soon arrived among the trees that stood in the rear. I halted near the edge, and separating the leaves with my hands, peered cautiously

through. I had no need to search further—Isolina was before my eyes.

CHAPTER XCIV.

THE COUNCIL.

Yes, there was my betrothed—within sight, within hearing, almost within reach of my hands; and I dared not touch, I dared not speak, I scarcely dared look upon her. My fingers trembled among the leaves—my heart rose and fell—I could feel within my breast its strokes, rapid and irregular—I could hear its sonorous vibration.

It was not at the first glance that I saw Isolina. On looking through the leaves, the *coup d'ail* was a scene that quite astonished me, and for a while occupied my attention. Since I had last gazed upon the great fire, the grouping around it had undergone an entire change; a new tableau was presented, that for the moment held me under a spell of surprise.

The fire no longer blazed, or only slightly, and when stirred; the logs had burned into coals, and now yielded a fainter light, but one more red and garish. It was steady, nevertheless, and the vastness of the pile rendered it strong enough to illumine the camp-ground to its utmost limits.

The fire was still encircled by savages, but no longer standing, nor grouped irregularly, as I had before observed them; on the contrary, they were seated, or rather squatted at equal distances from each other, and forming a ring that girdled the huge mound of embers.

There were about twenty of these men—I did not count them—but I observed that all were in their native costume—leggings, and breech-cloth to the waist—nothing above, save the armlets and shell-ornaments of nose, ears, and neck. All were profusely painted with chalk, ochre, and vermilion. Beyond doubt, I was looking upon the 'council.'

The other Indians—they in 'fancy dresses'—were all upon the ground, but they stood behind, retired a pace or two from the circle, and in groups of two, three, or four, talking in low mutterings. Others were moving about, still at a greater distance from the fire.

My observation of all these features of the scene did not occupy ten seconds of time—just so long as my eyes were getting accustomed to the light. At the end of that interval, my glance rested upon Isolina, and there became fixed. My fingers trembled among the leaves; my heart rose and fell; I could feel within my breast its strokes, rapid and irregular; I could hear its sonorous vibration.

In the chain of Indians that encircled the fire, there was a break—an interval of ten or a dozen feet. It was directly in front of the lodge, and above the fire; for the ground gently sloped from the tent towards the stream. In this spot the captive was seated. Her position was exactly between the lodge and the fire, and a little retired behind the circle of the council. The tent intervening between her and my position, had prevented me from seeing her at first.

She was half seated, half reclining upon a robe of wolf-skins. I saw that her arms were free; I saw that her limbs were bound. Her back was to the tent, her face turned towards the council. I could not see it.

To recognise my betrothed, I did not need to look upon her face; her matchless form, outlined against the red embers, was easily identified. The full round curve of the neck—the oval lines of the head—the majestic sweep of the shoulders—the arms smooth and symmetrical—all these were familiar to my eyes, for I had dwelt upon them in admiration. I could not be mistaken; the form before me was that graven upon my heart—it was Isolina's.

There was another salient point in this singular tableau, that could not escape observation. Beyond

the fire, and directly opposite to where Isolina was placed, I saw another well-known object—the white steed! He was not staked there, but haltered and held in hand by one of the Indians. He must have been lately brought upon the ground, for from neither of my former points of observation had I noticed him. He, like his mistress, was to be put on trial—his ownership was also matter of dispute.

There was in sight one more object that interested me—not with friendly interest did I regard it—but with disgust and indignation. Not seated in the council ring, not standing among the idle groups, but apart from all, I beheld Hissoo-royo the renegade. Savage as were the red warriors, fiend-like as they appeared with their paint-smears visages, not one looked so savage or fiend-like as he.

The features of this man were naturally bad; but the paint—for he had adopted this with every other vile custom of barbarian life—rendered their expression positively ferocious. The device upon his forehead was a death's-head and cross-bones, done in white chalk, and upon his breast appeared the well imitated semblance of a bleeding scalp—the appropriate symbols of a cruel disposition.

There was something unnatural in a white skin thus disfigured; for the native complexion was not hidden: here and there it could be perceived forming the ground of the motley elaboration—its pallid hue in strange contrast with the deeper colours that daubed it. It was not the canvas for such a picture.

Yet there the picture was—in red and yellow, black, white, and blue; there stood the deep-dyed villain.

I saw not his rival; I looked for him, but saw him not. Perhaps he was one of those who stood around?—perhaps he had not yet come up? He was the son of the head-chief—perhaps he was inside the lodge? The last was the most probable conjecture.

The great calumet was brought forward and lit by the fire; it was passed around the circle, from mouth to mouth, each savage satisfying himself with a single draw from its tube. I knew that this was the inauguration of the council. The trial was about to proceed.

CHAPTER XCV.

MEASURING THE CHANCES.

The situation in which I was placed by chance, could not have been better had I deliberately chosen it. I had under my eyes the council fire and council, the groups around—in short, the whole area of the camp.

What was of equal importance, I could see without being seen. Along the edge of the copse there extended a narrow belt of shadow, similar to that which had favoured me while in the channel, and produced by a like cause—for the stream and the selvedge of the grove were parallel to each other. The moonbeams fell obliquely upon the grove, and under the thick foliage of the pecans I was well screened from her light behind, while the lodge covered me from the glare of the fire in front.

I could not have been better placed for my purpose. I saw the advantage of the position, and resolved therefore to abide in it.

The observations and reflections thus given in detail occupied me but a few minutes of time. Thought is quick, and at that crisis mine was more than usually on the alert. Almost instantaneously did I perceive the points that most interested me, or had reference to my plans; almost instantaneously I had mastered the situation, and I next bent my mind upon the way to take advantage of it.

I saw there was but one way to proceed: my original scheme must be carried out. Under so many eyes, there was not the slightest chance that the captive could be stolen away; she must be taken

openly, and by a bold stroke. Of this was I convinced.

The question arose, when should I make the attempt? At that moment? She was not ten paces from where I stood! Could I rush forward, and with my knife set free her limbs? Might we then get off before the savages could fling themselves upon us?

Hopeless—impossible. She was too near them; she was too near the renegade who claimed her as his property. He was standing almost over her, within distance of a single leap. In his belt was the long triangular blade, the Spanish knife. He could have cut me down ere I could have severed a cord of her fastenings. The attempt would fail; success was hopeless—impossible. I must wait for a better opportunity; and I waited.

I remembered Rube's last word of counsel, not to act too hastily—and his reasons, that if I must make a 'desprit strike for it,' to leave the grand *coup* to the last moment. The circumstances could be no worse then than now.

Under the influence of this idea, I checked my impatience, and waited.

I watched Hissoo-royo; I watched the squatted forms around the fire; I watched the straggling groups behind them. In turn, my eyes wandered from one to the other.

At intervals, too, they rested upon Isolina. Up to this moment I had not seen her countenance; I saw only the reverse of that beautiful image so deeply graven upon my heart. But even then—under that suspense of peril—strange thoughts were passing within me. I felt a singular longing to look upon her face; I remembered the *herredero*.

It pleased fortune to smile upon me. So many little incidents were occurring in my favour, that I began to believe the fates propitious, and my hopes of success were growing stronger apace. Just then the captive turned her head, and her face was towards me. There was no mark on that fair brow; that soft cheek was without a scar; the delicate skin was intact, smooth, and diaphanous as ever. The *herredero* had been merciful!

Perhaps something had occurred to interrupt or hinder him from his horrid work? Would that the matador had met with a similar interruption! I could not tell—those profuse clusters covered all—neck, bosom, and shoulders were hidden under the dark dishevelment. I could not tell, but I did not dare to hope. Cyprio had seen the blood!

It was but a momentary glance, and her face was again turned away. At intervals she repeated it, and I saw that she looked in other directions. I could note the uneasiness of her manner; I could tell why those glances were given; I knew her design. O for one word in her hearing—one whisper!

It might not be; she was too closely watched. Jealous eyes were upon her; savage hearts were gloating over her beauty. No word could have reached her that would not have been heard by others—by all around the fire—for the silence was profound. The 'council' had not yet essayed to speak.

The stillness was at length broken by the voice of a crier, who in a shrill tone proclaimed that the 'council was in session.'

There was something so ceremonious in the whole proceedings, and every movement was made with such regularity, that but for the open air, the fire, the wild savage costumes, and fierce painted faces, I might have fancied myself in the presence of a civilised court, and witnessing a trial by jury. It was in effect just such a trial, though judge there was none. The members of the jury were themselves the judges, for in the simplicity of such primitive litigation, each was presumed to understand the law without an interpreter.

Pleaders, too, were equally absent; each party—

plaintiff and defendant—was expected to plead his own case. Such is the simple fashion in the high court of the prairies—a fashion which might elsewhere be adopted with advantage.

The name of 'Hissoo-royo' pealed loud upon the air. The crier was calling him into court—another parallel with the customs of civilisation.

Three times the name was pronounced—at each repetition in a shriller and louder tone than before.

The man might have spared his voice; he who was summoned was upon the spot, and ready to answer. Before the echo died away, the renegade uttered a loud response; and stepping to an open space within the ring, halted, drew himself up to his full height, folded his arms, and in this attitude stood waiting.

At that crisis the thought occurred to me, whether I should rush forward, and at once decide the fate of myself and my betrothed. The seated warriors appeared to be all unarmed; and the renegade—whose hand I most regarded—was now further off, having gone round to the opposite side of the fire. The situation was favourable, and for a moment I stood bending upon the spring.

But my eye fell upon the spectators in the background; many of them were directly in the way I should have to take; I saw that many of them carried weapons—either in their hands, or upon their persons—and that Hissoo-royo himself was still too near.

I could never fight my way against such odds. I could not break such a line—it would be madness to attempt it. Rube's counsel was again ringing in my ears; and once more I abandoned the rash design.

CHAPTER XCVI.

THE WHITE-HAIRED CHIEF.

There was an interval of silence—a dramatic pause—that lasted for more than a minute. It was ended by one of the council rising to his feet, and by a gesture inviting Hissoo-royo to speak.

The renegade began:

'Red warriors of the Hietan! brothers! what I have to say before the council will not require many words. I claim yonder Mexican girl as my captive, and therefore as my own. Who denies my right? I claim the white horse as mine—my prize fairly taken.'

The speaker paused, as if to wait for further commands from the council.

'Hissoo-royo has spoken his claim to the Mexican maiden and the white steed. He has not said upon what right he rests it. Let him declare his right in presence of the council!'

This was said by the same Indian who had made the gesture, and who appeared to direct the proceedings. He was not acting by any superior authority, which he may have possessed, but merely by reason of his being the oldest of the party. Among the Indians, age gives precedence.

'Brothers!' said Hissoo-royo, in obedience to the command—'my claim is just—of that you are to be the judges; I know your true hearts—you will not shut them against justice. I need not read to you your own law, that he who makes a captive has the right to keep it—to do with it as he will. This is the law of your tribe—of my tribe as well, for yours is mine.'

Grunts of approbation caused a momentary interruption in the speech.

'Hietans!' resumed the speaker, 'my skin is white, but my heart is the colour of your own. You did me the honour to adopt me into your nation; you honoured me by making me first a warrior, and afterwards a war-chief. Have I ever given you cause to regret what you have done? Have I ever betrayed your trust?'

A volley of exclamations indicated a response in the negative.

'I have confidence, then, in your love of justice and truth; I have no fear that the colour of my skin will blind your eyes, for you all know the colour of my heart.'

Fresh signs of approbation followed this adroit stroke.

'Then, brothers! listen to my cause: I claim the maiden and the horse. I need not tell where they were found, and how; your own eyes were witnesses of their capture. There has been talk of a doubt as to who made it, for many horsemen were in the pursuit. I deny that there is any doubt. My lazo was first over the head of the horse—was first tightened around his throat—first brought him to a stand. To take the horse was to take the rider. It was my deed; both are my captives. I claim both as my property. Who is he that disputes my claim? Let him stand forth!'

Having delivered this challenge with a defiant emphasis, the speaker fell back into his former attitude; and, once more folding his arms, remained silent and immobile.

Another pause followed, which was again terminated by a sign from the old warrior who had first spoken. This gesture was directed to the crier, who the moment after, raising his loud, shrill voice, called out:

'Wakono!'

The name caused me to start as if struck by an arrow. It was my own appellation: I was Wakono!

It was pronounced thrice, each time louder than the preceding:

'Wakono! Wakono! Wakono!'

A light flashed upon me. Wakono was the rival claimant! He whose breech-cloth was around my hips, whose robe hung from my shoulders, whose plumed bonnet adorned my head, whose pigments disfigured my face—he of the red hand upon his breast, and the cross upon his brow, was no other than Wakono!

I cannot describe the singular sensation I felt at this discovery. I was in a perilous position indeed. My fingers trembled among the leaves. I released the branchlets, and let them close up before my face; I dared not trust myself to look forth.

For some moments I stood still and silent, but not without trembling. I could not steady my nerves under such a dread agitation.

I listened, but looked not. There was an interval of breathless silence—no one seemed to stir or speak—they were waiting the effect of the summons.

Once more the voice of the crier was heard pronouncing in triple repetition: 'Wakono! Wakono! Wakono!'

Again followed an interval of silence; but I could hear low mutterings of surprise and disappointment as soon as it was perceived that the Indian did not answer to his name.

I alone knew the reason of his absence; I knew that Wakono could not—the true Wakono—that his counterfeit would not come.

Though I had undertaken to personate the savage chieftain, for this act in the drama I was not prepared. The stage must wait.

Even at that moment I was sensible of the ludicrousness of the situation; so extreme was it, that even at that moment of direst peril, I felt a half inclination for laughter! But the feeling was easily checked; and once more parting the branches, I ventured to look forth.

'I saw there was some confusion. Wakono had been reported 'missing.' The members of the council still preserved both their seats and stoical composure; but the younger warriors behind were uttering harsh speculations, and moving about from place to place with that restless air that betokens at once surprise and disappointment.

At this crisis, an Indian was seen emerging from the tent. He was a man of somewhat venerable aspect, though venerable more from age than any positive expression of virtue. His cheeks were furrowed by time, and his hair white as bleached flax—a rare sight among Indians.

There was something about this individual that bespoke him a person of authority. Wakono was the son of the chief—the chief, then, should be an old man. This must be he?

I had no doubt of it, and my conjecture proved to be correct.

The white-haired Indian stepped forward to the edge of the ring, and with a wave of his hand commanded silence.

He was instantly obeyed. The murmurings ceased, and all placed themselves in fixed attitudes to listen.

THE POSTMAN'S KNOCK.

THE postman's knock is more audible than ever in London:

No. 17 does an acknowledgment get,
And 18 a letter of love;

and—what is still further a matter of interest to us—it is heard at an earlier hour than ever in the morning. Mr Briggs, a year or two ago, was daily obliged to bustle off from Prospect Villas to the City without waiting for the general postman, whose visits were tormentingly delayed beyond the hour when Briggs could conscientiously remain in the bosom of his family; but now, before the breakfast is well ended, up comes the postman, with a letter to state that Aunt Jane will arrive on a visit that very day, and will reach Euston Square by six o'clock—which will just enable Briggs to call for her on his way home from office: whereupon he blesses Rowland Hill, and departs cityward in a benevolent frame of mind. And here we are reminded that the postman's knock is, after all, not a necessary part of the arrangements; for if we would only observe fair-play towards the dignitaries of St Martin's le Grand, as a means of enabling them to observe fair-play towards us, we should provide letter-boxes in our doors: the postman's weary trudge would become marvellously shortened in time though not in distance; and every Briggs or Paterfamilias would be the better for it.

The new postal district reform goes on bravely: we have already gained forty minutes by it in the first morning delivery; and as time is money to a man so thoroughly commercial as John Bull, those minutes do really increase our national wealth. What the districts mean, is not yet clearly known to all; but the knowledge is gradually coming. There are monster maps of London staring at us in the shop-windows, belonging to Guides, and Handbooks, and newspaper supplements—maps

Too broad to be conceived

By any narrow mind,

as Hood might have said—maps in which N. and W., and E. C. and S. E., and other initials, are shewn as belonging each to a huge slice taken out of the metropolis. But before treating of these initials and districts, it may be well to shew how the wonderful postal system of the great city has grown up.

Our country post was originally carried by special messengers, by common carriers, or by relays of pack-horses, according to the circumstances of the times, or the energy of individuals: the letters from one part to another of the same town being easily managed by foot-messengers, each letter being the subject of a separate bargain or arrangement. The corporation records of Bristol contain an entry of one penny given to a carrier for conveying a letter to London. It was not until the time of Charles I. that a regular system

was established for conveying letters between the capitals of the two kingdoms. In 1635, the king issued a proclamation, commanding 'his postmaster of England for foreign parts to settle a morning-post or two, to run night and day between Edinburgh and London, to go thither and come back again in six days, and to take with them all such letters as shall be directed to any post-town in or near that road;' and it was at the same time ordered that by-posts should be connected with many places on the main line, to bring and carry out the letters from and to other towns. The postage-rate was fixed at 2d. the single letter for any distance under 80 miles; 4d. up to 140 miles; 6d. for any greater distance in England; and 8d. to any place in Scotland. The mail-service was a source of perquisite to some of the courtiers; and to secure this privilege, private persons were forbidden to carry letters as a source of profit. This right was tested in 1649, when the common council of London set up a post in rivalry with that of the government; they were instantly proceeded against for breach of privilege, and compelled to abandon their plan.

The penny-post is not a modern invention; for it appears that in 1683, one Robert Murray established a penny-post for the conveyance of letters and small parcels about London and its suburbs; he assigned this to William Dockwra. The plan, however, was denounced by the ultra-Protestant party, as a contrivance of the Jesuits; and it was alleged that if the bags were examined, they would be found full of popish plots. Nevertheless, Dockwra worked his post for several years; till its profits excited the envy of the government, who seized it on the ground of its being an infringement of the rights of the crown, granting him a pension to compensate him for the loss. This was the commencement of the London district post, of which Dockwra was subsequently appointed comptroller. Throughout all the changes, political and civil, of a century and a half, this London post remained a separate department of the general Post-office until 1854. No limit appears to have been placed by Dockwra to the weight of a packet sent by his post, but its value was restricted to L.10. The comptroller brought himself into trouble in 1698. The officers and messengers under him declared, in a memorial to the Treasury, that 'he wilfully doth what in him lyes to lessen the revenue of the penny post-office, that he may farm it or get it into his own hands;' that 'he forbids the taking in any handboxes (except very small), and all parcels above a pound, which, when they were taken, did bring in considerable advantage to the office, they being now at great charge sent by porters into the city, and by coaches and watermen into the country, which formerly went by penny-post messengers, much cheaper and more satisfactory;' and that 'he stops, under spetious pretences, most parcels that are taken in, which is great damage to tradesmen by loosing their customers, or spoiling their goods, and many times hazard the life of the patient when physic is sent by a doctor or an apothecary.' He was, moreover, charged with stopping parcels, which it was hinted he misappropriated; with opening letters, and taking from them bills, &c.; and with persecuting all the officers except his own creatures. These delinquencies, real or alleged, led to the removal of Dockwra from the office of comptroller. The next fact we find relating to London letters was an attempt made in 1708 by a Mr Povey to establish a halfpenny-post in opposition to the official penny-post; but this enterprise likewise was suppressed by law. It thus appears that the penny-post of those days comprised not only the delivery of letters within the limits of London, but that of parcels also, and was thus the prototype of the modern Parcels' Delivery Company.

The state of the London postal service in 1748, about the middle of the reign of George II., is very well represented in *A Tour through the whole Island of Great Britain*, of which a fourth edition was published in that year: the work being originally, as is said—though we know not on what grounds—by Defoe. 'The Post-office,' we are told, 'is kept in Lombard Street, in a large house formerly Sir Robert Viner's, and is under admirable management. The penny-post is a branch of it, and a most useful addition to trade and business; for by it letters are delivered to the remotest corners of the town almost as soon as they could be sent by a messenger, and that from four, five, six, to eight times a day, according as the distance of the place makes it practicable—inasmuch that you may send a letter from Limehouse in the east, to the furthest part of Westminster for a penny, several times in the same day, and to the neighbouring villages, as Kensington, Hammersmith, Chiswick, &c., westward; Newington, Islington, Kentish Town, Hampstead, Holloway, Highgate, &c., northward; Newington Butts, Camberwell, &c., southward; and Stepney, Poplar, Bow, Stratford, Deptford, Greenwich, &c., eastward—once a day. Nor are you tied up to a single piece of paper, as in the general post-office, but any packet under a pound-weight goes at the same price.' If this account be correct, the cheapness excelled that even of this present year, 1857, so far as London alone is concerned; for the boldness of our postal reformers has not yet brought us to the state in which the postman's knock becomes the harbinger of a pound-packet conveyed for a charge of one penny.

We do not here touch upon the large subject of the general post, with its mail-coaches and mail-packets; or upon Mr Palmer's invention, which converted slow into rapid conveyance; or upon the state pensions, through which the never-dying 'heirs of the Duke of Schomberg,' and the Dukes of Grafton and Marlborough, obtain large sums annually out of the postal revenues; or upon the franking system, whereby 'Dr Crichton, carrying with him a cow and divers other necessities,' 'a deal-case with four slices of bacon,' 'a case of knives and forks,' 'fifteen couple of hounds,' and 'two servant-maids going as laundresses to my Lord Ambassador Methuen,' were in Queen Anne's reign 'franked' to their several destinations by virtue of parliamentary privileges—we touch on none of these things, but confine attention to the London district-post.

During the great war with France, when taxes of all kinds were high, the postal rates were increased. In 1801, the London penny-post became a twopenny-post, confined within rather narrow district limits, beyond which there was a zone of threepenny-post, still belonging to the London rather than to the general system. It was about 1814 that the authorities began to find the old house in Lombard Street too small for the increasing business; but with the slowness characteristic of most official undertakings in this country, it was not until 1829 that the vast structure in St Martin's le Grand was opened—certainly at that time the largest and finest post-office in the world, and indeed we are not aware that it has since been equalled. Large as it is, however, it is full to overflowing; the Money-order Office has been driven to find a house over the way; the central hall is nearly blocked up with most inartistic but probably convenient additional receiving and sorting rooms; and we may look forward to a parliamentary demand for a new building by and by. The reader is of course aware that in 1830 the mails first began to be conveyed by railways, and that the number of letters was increased by the facilities thus offered; that in 1835 the newspaper stamp was reduced to one penny, offering a temptation to print, sell, buy, and post more newspapers than before; and that in 1840, after three years' indolence

perseverance, Mr Rowland Hill succeeded in bringing into operation one of the greatest social improvements of our age—the general penny-postal system—inducing those to write letters who never wrote before, and those who had written, to double or quadruple their epistolary correspondence. These matters being borne in mind, it will be easy to understand how they have led to the partition of the metropolis into several distinct postal districts.

It must be remembered, not only that millions of letters are every year conveyed from one part to another of the metropolis itself, but that others arrive daily in London from the country, that a third group leave London daily for transmission into the country, and that a fourth simply pass through London *en route*, being neither posted nor delivered therein. Only by combining these four groups can we rightly appreciate the magnitude of the system. There are 11,000 post-offices or receiving-houses in the United Kingdom, from all of which letters may need to be transmitted to the metropolis, either for delivery there, or *en route* to other places; and as, conversely, London may need to send letters to all these 11,000 places, St Martin's le Grand has much to do besides attending to the merely London letters, and indeed, beyond all this, the entire foreign and colonial mails are managed in London. It is on these several accounts that the letters passing into or out of or through London daily so vastly exceed in number those in any other city in the world. Great as has been the increase in all departments of our postal system, that of London eclipses all the others in rapidity of advance; for whereas the letters of the whole United Kingdom increased *sixfold* between 1840 and 1856, those of London increased *ninefold*. The letters in which London is concerned now amount to more than 200,000,000 annually; that is, in round numbers, 50,000,000 posted in London for delivery in London, 50,000,000 posted in the country for delivery in London, and 100,000,000 that leave London either direct or *in transitu* to places all over the world.

Now, fixing attention on 100,000,000 of these letters, those which are delivered in London comprising more than one-fifth of all the letters that pass into or through any or all parts of the United Kingdom (about 470,000,000 in 1856), we shall at once understand how important must be any improvement that will expedite the delivery of these letters. There are about 500 of the red-coated personages who give the postman's knock, each of whom delivers on an average, say 700 letters in an average day; the number of miles he walks in the performance of this duty is something wonderful; and no one but himself can truly tell how much his labours are increased by any ambiguity or blunder in the direction of the letters.

It was in the Second Report of the postmaster-general relating to the operations of 1855, that the public were first informed of a project concerning the subdivision of the metropolis into postal districts. A hint to this effect had been thrown out by the commissioners of Post-office inquiry in 1837, and again by the Commons' committee on the same subject in 1843; and in December 1854, Viscount Canning, at that time postmaster-general, appointed a committee of officers at St Martin's le Grand to investigate the matter. The project to be examined was this—how best to divide London into districts, with a separate sorting-office for each, and hourly deliveries during twelve hours in the day. It was shewn that the distribution of that large portion of London district-letters intended for delivery near the place of posting, and which amount to about one-fifth of the whole number of London district-letters daily collected, might be much accelerated in the outer parts of the metropolis by stopping those letters at a local sorting-office, instead of sending them to one central office for

all London. It was also rendered evident that the delivery of the morning general-post might commence at an earlier hour. As a means of obtaining these and other useful results, the committee recommended—that the metropolis should be divided into ten postal districts, two central and eight suburban; that these should extend to a twelve-mile radius from Charing Cross; that each district should be treated as a distinct town in regard to postal matters; that each district-office, after collecting from the receiving-offices within its limits, should sort the letters, and send nine bags to the other nine districts—one to each; that it should deliver, by its own postmen, the letters directed to houses within its limits; that it should receive nine bags from the other nine districts—one from each—containing letters posted in those districts for the district in question; that those letters should be delivered by its own postmen; and that mail-carts should rapidly convey the bags from one district-office to another. The committee gave themselves the task of plotting out the proposed postal districts; they considered that the two central districts should include such an area, having the river Thames for a southern boundary, as would permit the letter-carriers to reach the points at which their deliveries would commence in about ten or fifteen minutes after leaving the district-office; and that the boundaries of those districts should, where practicable, be marked by the well-defined lines of main streets or roads; keeping together, however, the several parts of any locality which has a connected and peculiar character. The eight country-districts were, so far as possible, to be bounded by the then existing limits of the country-deliveries of the London district-post. A map, prepared by the committee, was printed in lithograph, and coloured, shewing the ten districts—named respectively Northern, North-eastern, North-western, Eastern, East Central, Western, West Central, Southern, South-eastern, and South-western—stretching from Waltham Cross, in the north, to Carshalton in the south, from Romford in the east, to Southall in the west.

It fell to the lot of the Duke of Argyll to carry out the plan commenced by his predecessor, the Viscount Canning. In the Second Report, above adverted to, published early in 1856, his grace points out how much time will be saved by obviating the necessity of sending merely local letters to St Martin's le Grand. 'Thus a letter from Cavendish Square to Grosvenor Square, instead of travelling four or five miles, as at present, could go almost directly from one place to another.' Under the former system, the first morning delivery was intrusted to about 480 postmen, who carried 480 bags to 480 'beats,' or small neighbourhoods; the letters were first sorted into districts, and then sub-sorted into beats by persons who alone possessed the minute local knowledge required for that purpose. Now the postmaster-general pointed out how the public might assist in expediting the postal service by putting a few initials on their letters, that would enable the *first* or district sorting to be effected before the letters reach London at all. Every railway traveller knows that mail-carriages, or post-office carriages, form part of every mail-train; these contain not only bags of letters, but clerks who are employed throughout the day in sorting. If a bag of letters, say, be sent from Edinburgh to London, that bag under the old system, was conveyed unopened to St Martin's le Grand, where both the primary and the secondary sorting were effected; but under the improved plan suggested, the primary sorting would be done either at Edinburgh or in the railway train; inasmuch that, on arriving at Euston station, the letters would be found separated into ten groups packed in ten bags for ten districts. At half-past four o'clock in the morning, therefore, when the train arrives, half the sorting will have been completed,

and the bags could be sent to the ten district-offices without going to St Martin's le Grand at all: this would insure, perhaps, one hour earlier delivery. The postmaster-general said: 'To secure so great an advantage, it is perhaps not unreasonable to hope that the public may be willing to give its ready co-operation. The whole plan of acceleration in the delivery of the general-post letters depends upon the first assortment being effected previously to the arrival of the mails. As London will, for postal purposes, be in effect divided into ten towns, it is essential to the complete working of the plan that the letters should be directed accordingly. For this purpose it would suffice, if to the address there were appended initial letters denoting the district, as N. for the northern, S. W. for the south-western, &c.; the public of course first receiving the necessary information, and all other aids being given. To enable provincial correspondents to act on this suggestion, little more would be necessary than for London residents to append the initial letters, as above, to their own. In many instances, the address thus given would be shorter than at present: thus "Hill Street, Berkeley Square," might be reduced to "Hill Street, W."'

During the year 1856, the Post-office authorities were busily engaged in preparations for this reform. The change itself became publicly known about the month of November; and it is highly gratifying to hear that the saving of time has already been very marked. In the Third Report of the postmaster-general, published in April of the present year, we find that *more than half* of the letters posted in the country for delivery in London undergo their first sorting before they reach London at all. What is the consequence? The delivery *begins* thirty-three minutes earlier than it did twelve months ago, and *ends* forty-six minutes earlier—giving an average of just about forty minutes' saving. And when letter-writers in the country habituate themselves still more to the use of the initial, a still further saving will be effected; for it must be remembered that although a London postman knows that 'Hill Street, Berkeley Square,' is in district W., that fact may not be known so readily by the sorters in the country or in the mail-train; the letter will reach safely, but it is not certain that the primary sorting can be done before the letter reaches London. But this is too favourable an example, for the names almost indicate that they *must* be in the western district; it is more to the purpose to ask whether a sorter in the country would know that 'William Street, New Bridge Street,' is in the East Central district, unless the initials E. C. were written on the letter? The postmaster-general further tells us, that about one-third of the local letters, directed from one part of London to another, have now the initials written on them. The saving of time, averaging forty minutes in London generally, amounts to one hour at many of the suburban villages. Considering that this great improvement has been wrought with very little addition to the public expenditure, the saving of time, on perhaps 150,000 letters a day, is a positive increase to the commercial wealth and the social comfort of the metropolis; and considering that all Londoners are more or less interested in the matter, the least they can do is to try to aid the postmaster-general in the matter.

The names of streets are a terrible trouble to the postmen, who, through their chief, are earnestly imploring the Metropolitan Board of Works to effect a reform in this direction. If a letter be addressed to John Street, London, correct in all other particulars, but not denoting *which* John Street, who can tell the amount of perplexity produced? *There are sixty John Streets in London!* And then the King Streets and Queen Streets, the New Streets and William Streets—each group varies from forty to sixty in number. In

the Third Report, the postmaster-general makes especial mention of the Westbourne series as a very embarrassing one; for not only is that name combined with the usual street, terrace, &c.; but there are all varieties of what may be called ternary compounds, in which the first two names are Westbourne Park, and the third is cottage, crescent, place, road, terrace, &c. villa. The slightest blunder in the direction might give the poor postman half a mile of additional walking; and is it to be expected that a country letter-writer should be always keen enough to observe the nice distinctions between 'Westbourne Park Cottage' and 'Westbourne Park Villas?' It is not every cottager that knows itself from a villa, although the villa sometimes looks disdainfully at a cottage. Mr. Colles, inspector of letter-carriers, reported on some of the anomalies in the numbering of houses, irrespective of those in the naming of streets. During his inspection he found the four corners of a new and unfinished street all called No. 1; he found a street built by seven persons, each of whom gave a favourite name to his own group, with No. 1 to begin each group, and thus there were seven No. 1's in the same street; he found No. 95 between Nos. 14 and 16 in a particular street—an arrangement so extraordinary, that he was induced to inquire into its cause. 'A woman came to the door, when I requested to be informed why a brass number 95 should appear between 14 and 16: she said it was the number of a house she formerly lived at in another street, and it (meaning the brass plate) being a very good one, she thought it would do for her present residence as well as any other!'

Thus the postman's difficulties are not a few; so far as we can alleviate them, it is nothing more than just so to do.

THE GARLAND OF WILD-FLOWERS

THESE be simple flowers, lady,

That I have culled for you;

For in no lordly garden

Or gay parterre they grew;

But on the dewy field-bank,

Where the poorest child may roam,

And fill its lap with treasures,

To bear exulting home.

Any little country maiden

Can call you these by name;

I cannot bring you rarer,

Since no foot of ground I claim;

But wide and rich is the domain

I share with millions more:

Old England's meads and cornfields

The gardens of her poor.

For while man sows 'the staff of life,'

Unseen, a higher hand

Is strewing gems of beauty

To gladden all the land.

The farmer calls them worthless weeds;

But *He* sends sun and rain,

Till many-hued they blossom

Amongst the golden grain.

So do not scorn them, lady,

These humble, God-sown flowers—

Oh! they were lovely *once* to you

In childhood's guileless hours—

So rather humbly join in praise

To *Him* who thus has given,

To rich and poor alike, a boon

Of beauty straight from Heaven.

THE ATLANTIC TELEGRAPH.

THE American *Niagara*—do not be alarmed, gentle reader, we mean the frigate, not the fall—arrived recently in England to receive her share of a very interesting burden—the metallic cable which is about to be laid across the depths of the Atlantic, in order that one of the vast gulfs of the earth may be commercially annihilated. The English *Agamemnon*, of Sebastopol fame, had long been waiting at Portsmouth for the other half of the load. About the 13th of July, these mighty war-ships will trim their screws, and start for the mid-Atlantic, in generous rivalry to try which can first waft thence to its own native shore the end of the bond thenceforth to annex the New World to the Old. The two halves of the cable will be firmly spliced together in mid-ocean, and each vessel will then steam its own way; the one towards the west, and the other towards the east, paying out the metallic rope from its stern. It is anticipated that the cable will be safely deposited in its deep resting-place, in the course of eight or ten days at most.

The cable consists of a strand of seven copper wires, firmly twisted together, and enclosed first within a thick coating of gutta-percha, to insulate it from all conducting influences; and then in a layer of rope-yarn, saturated with a compound of tar and oil. The copper core, gutta-percha sheath, and hempen greatcoat, are next all enveloped together in an investment of iron wire, bound closely round them to furnish tenacity and strength. In this outer investment, there are eighteen strands, each consisting of seven iron wires. The wires are twisted together to form the strand, and the strands are twisted round yarn and gutta-percha, to form the rope. The copper strand and the iron strands are each one-sixteenth of an inch in diameter; and the rope itself is about eleven-sixteenths of an inch thick. Notwithstanding its containing so much metal in its composition, this ingeniously constructed cable is so flexible that it can be coiled about with the utmost facility.

The contractors who have undertaken the labour of preparing this gigantic cable, have engaged to have 2000 miles of it completed and ready for embarkation by the middle of July. The labour is equally divided between the Messrs Newall of Birkenhead, and the Messrs Glass and Elliott of East Greenwich. Through the instrumentality of steam, each of these firms turns out twenty miles of the rope per day, at a cost of about £100 per mile. Nearly all the wire-drawers of England are pressed to the utmost to keep up the necessary supply of the metallic portion of the raw material. In the neighbourhood of the works, light wagons, drawn

each by four horses, are continually to be seen hurrying backwards and forwards at high speed with huge drums of the twisted wire, the driver plying his whip, and turning the corners with an air that reminds one of the red-coated man of high dignity who was encountered everywhere, and stopped nowhere, before Her Majesty's mail-bags went upon the rail.

The telegraphically important portion of the cable is that small strand of copper wire which lies within the thick gutta-percha tube. Slight, indeed, does that sixteenth-of-an-inch strand look for the work to which it is destined—the conveyance to and fro of a world's messages through nearly 2000 miles of distance, lying chiefly at the bottom of a deep sea. One of the most wonderful and interesting features of the novel enterprise, in fact, is the boldness with which the idea has been conceived of carrying out an object so stupendous by an instrumentality so small. To the eye, the rope seems fitted to connect the posts of a laundress's drying-ground, rather than the eastern and western continents of the wide world. No one who has stood in the yard of the factory at Greenwich, and seen the tar-blackened men coiling that slim rope round in the pits of the yard, as it is delivered by rollers through the wall from the machinery, can wonder that many, among even electrically and mechanically initiated men, have questioned the possibility of its ever efficiently performing the office for which it has been designed. The indefatigable and sagacious electrician of the company, Mr Whitehouse, has, however, a large series of very ponderous facts ready for the conversion of such sceptics, when they trust themselves within reach of his experimental demonstration.

It is well worth while, merely as an act of passing curiosity, for any one who can procure the *entrée* of the somewhat closely guarded cable-treasury, to take a glance at that lightning-king, Mr Whitehouse, in his cabinet. In a small chamber, looking out over the pits where many hundred miles of the cable are coiled in flat layers, he may be daily found, surrounded by the ingenious and complex implements which are the insignia of his rule. In one nook of the instrumental repertory there is an exquisitely delicate balance, very much like a steelyard—with that the cunning manipulator weighs the force of his electrical currents. He makes the voltaic stream run along a wire coiled round a bar of soft iron, which then becomes a magnet, and attracts the iron-shod short end of the steelyard with a power that is measured by the number of grains lifted up at the opposite end. That balance has been christened by Mr Whitehouse his *magneto-electrometer*. It is obviously a pet child; and, indeed, it is deserving of its position in his affections; for a more beautiful

practical application of a fundamental principle of science has never been devised by that inscrutable agent, the brain of inventive man. It is only necessary to see the old measure of electric force, the galvanometer, and this invention of Mr Whitehouse at work side by side, for the infinite superiority of the latter over the former to be apprehended. The needle of the galvanometer, when an electrical current is brought to it for examination, all at once starts madly off with a series of somersets, whirling over and over, and jerking its magnetised ends this way and that; and it is well if, after two or three minutes of such aberrant and hysterical demeanour, it settles quietly down into a deflection that philosophy can make head or tail of. The magneto-electrometer, under the same circumstances, tilts up a given number of grains on the end of the steelyard in a steady matter-of-fact business way, and then refuses to lift an additional one, and sends in the refusal as its estimation of the limit of the electric force. Mr Whitehouse would have earned a reputation in mechanical estimation, if he had done nothing else besides superseding the old crazy and fitful galvanometer, in matters where precise investigations into the behaviour of considerable degrees of electrical force are required.

Mr Whitehouse has also in his cabinet another no less ingenious implement for doing, with regard to the *velocity* of electrical currents, what the magneto-electrometer does with regard to their *force*. There is a long ribbon of paper in process of being unrolled from a drum by clock-work, and the ribbon of paper is saturated with a colourless substance, which receives a deep purple stain whenever a stream of electrical influence is caused to pass through it. There are two metal styles pressed down upon the paper—a metal plate lying beneath—and a seconds' pendulum swaying to and fro, turns on and off an electrical stream to the styles. In this way, as the paper is drawn from the drum, two parallel traces, a *second long*, are left on its surface, with blank seconds' intervals lying between them. But one style can be placed in connection with the beginning of a long wire, while the other communicates with its end, and so one trace lags back behind its companion just so long as the electrical current takes to flow through the stretch of the wire. In reality, the printing is performed by two relay-batteries, one for each style, which are called into operation by the primary current as it passes through a coil, wound on a bar of soft iron, and converts it into a magnet. When the bar becomes a magnet, it opens the flood-gates of the relay-batteries, so to speak, and makes them print. This, however, makes no difference in the practical result indicated by the arrangement: the journeymen relay-batteries print on the instant when the primary current there passing directs them to do so.

As Mr Whitehouse stands reflectively in his cabinet, looking at the creations of his own sagacious brain and ingenious hands, he has a cobweb of wires enveloping him, until he seems almost like some astute old spider, with its feelers out in all directions, patiently waiting for the earliest intimation of the approach of a stray visitor and victim to his net. There are wires through the ceiling, and wires through the wall, and wires through the floor; wires on this hand, and wires on that. Take heed to your steps as you venture into this suspicious-looking retreat, or you will be tripped

up by a strand extended under your feet. Take care of your head, or you will be suspended by a stretcher that comes from the window to a pair of vicious-looking magnetic coils, before you know what you are doing. Look to your coat-tails, or they will be pinned and impaled as you turn round. The meaning of all this wire-drawn complexity and confusion is, that the hundreds of miles of cable coiled up in the yard have sympathetic relations with the instruments of this magical room, and can be acted upon by them in any conceivable way, either in lengths of half-a-dozen inches, or of a thousand miles. Mr Whitehouse has only to put now this wire and that into connection, and now to change this copper point from the binding-screw to the right, so that it shall rest in the grasp of that on the left, and he is able to ask all sorts of curious and prying questions of the raw material he has to deal with; and it is very rarely indeed that he asks a question without eliciting a reply.

Among the deeply interesting replies Mr Whitehouse has thus extracted from the Atlantic Telegraph cable, while it has been in the process of construction, there are two or three which deserve to be known as widely and generally as the cable itself is long. That insulated core, when it is stretched across the Atlantic, will transmit its electrical messages, not as a simple conducting-wire, such as those are which are suspended for telegraphic purposes in the air, but by accumulated charge and subsequent discharge. The cable will be a capacious Leyden jar, Atlantic-breadth long, the gutta-percha sheath being its insulating layer, the copper strand its interior conducting coat, and the iron covering and the water of the sea, its outer coat. Every time a signal is sent through it, the entire jar must be filled with electricity, and discharged. It is well, then, that the copper strand in the middle is a small one. If it were a large one as well as a long one, it would need a proportionally enormous expenditure of electricity to make it perform its work. Mr Whitehouse demonstrates the fact of this being the actual electrical nature of the structure, by turning up into the air, and so insulating, the further ends of two pieces of the cable, one being 15 miles, and the other 200 miles long. The 15 mile length is then charged, and by its discharge it lifts 1075 grains on the magneto-electrometer, as the discharge magnetises the iron bar. The same thing being done with the 200 mile length, the discharge lifts 2300 grains. The long piece of cable receives and holds more electricity than the short one; and the larger quantity makes itself manifest by the exertion of greater power, when it is changed from the static into the moving state.

But how much electricity does it really take to charge hundred miles' lengths of wire? If the Atlantic cable is to be thousands of miles long, allowing for its curvatures, will it need thousands of pairs of voltaic plates to render it telegraphically available and active? It would, if you made it large as well as long; but it will not as it is made, with its slender core of twisted copper strand. Mr Whitehouse takes seven small triangular fragments of zinc, coats them with sealing-wax, and then chips off by a knife, from one of the points of each, the sealing-wax to an extent about as large as the letter 'o' in the print of this page; copper-wire being attached to the plates, and these being then immersed in seven small glass cells, charged with a diluted acid, the whole becomes a lilliputian voltaic battery, with the seven minute zinc-points for its sole acting part. With this lilliput battery, the writer of

this article printed clearly defined and distinct telegraphic marks upon the ordinary ribbon of chemically prepared paper, *through 660 miles of the cable*; the length of time occupied by the passage of this feeble current through the 660 miles of the cable being no more than nine-tenths of a second. This curious piece of printing is retained in the writer's possession, that he may have a friendly monitor near at hand to fall back upon, whenever he feels himself inclining to *say of anything*, 'That cannot be.' Henceforth, he intends to wear that cabalistic fragment of paper as his *anti-septic* charm.

A simple voltaic current, sent forth from 72 pair of plates of 16 square inches each, lifts 25,000 grains on the magneto-electrometer, when thrown upon its magnetising coil at once. It lifts 10,650 grains when sent to the magneto-electrometer through 200 miles of cable; 8250, when sent through 400 miles; and 1400 grains when sent through 600 miles. It will be seen from this ratio that there is nothing to fear in the mere breadth of the Atlantic—speaking in an electro-telegraphic sense—when it is borne in mind, at the same time, that the lilliputian battery of seven points prints through 660 miles of cable; and when it is also understood that the enfeebled current, on arriving at the other side of the ocean, will be set, not to do hard mechanical labour, but simply to call relay-batteries into operation which will work the prickers of Professor Morse's apparatus as the ribbon of paper is drawn beneath them. The primary current will be passed round a soft iron bar a sufficient number of times to be again multiplied into strength; thus intensified, it will make a temporary magnet of the iron bar, and the magnet, *pro tem*, will pull down the armature, and set the recording prickers to their labour.

Seventy-two pair of 16 inch voltaic plates—that is, zinc plates made electrically active by the chemical influence of acids—can raise 1400 grains at the distance of 600 miles. It effects this task with a loss of half a second for the time consumed on the journey. Ten plates of 100 square inches acting through the magnetisation of iron bars and the secondary currents called up in coiled wires by the magnetism, send forth a stream of influence which can only lift 745 grains at the distance of 600 miles; but this stream loses only nineteen-hundredths of a second. Simple voltaic electricity has *less motor force* than the electricity of magnetic induction; but the weak electricity of magnetic induction, strange to say, moves through the insulated and wire-bound cable with a *higher rate of speed* than the strong electricity of a voltaic character. As the messages of two mighty nations will have, for some time at least, to be transmitted through a single cable, it is a matter of no small importance that the most nimble messenger should be selected to do the work—that Ariel rather than Caliban should be sent upon the service. It will make a difference of some hundred pounds per week in the revenue of the company, whether two or six words per second can be transmitted through the telegraphic cable; hence, magnetic induction coils will be used in working the Atlantic Telegraph in preference to the simple voltaic battery. Here, again, there is a proof of the practical wisdom which has selected a small cable at a cost of L.100, and with a weight of less than one ton per mile, rather than a larger, heavier, and more costly structure depending upon its transmitting core for its strength. With such an implement of transmission, the weak, but humble induction coils could not have been employed. Several pair of induction coils, five feet long, but generating a current of very limited intensity, will be excited by large voltaic cells, containing plates of 2000 square inches. It is anticipated that the cost of working these batteries in the service of transatlantic telegraphy, will not exceed a shilling per hour.

But suppose that this slim cable should be stretched

by its own weight, when six miles of it hangs looped down in the mid-Atlantic, its curve not yet sounding the depth of the ocean—what will happen then? If the already fine, and unquestionably soft and ductile core should be drawn out still finer by the strain, will it cease to be available as a means of telegraphic communication through so wide a span? will it no longer be able to transmit electricity enough to excite the operating magnet on the further shore of the broad ocean? As an answer to this question, Mr Whitehouse takes 600 miles of the cable, and finds that, through these, 745 grains are lifted on the magneto-electrometer by 72 pair of plates; and he then inserts a *whole mile of wire eleven times as small* as the copper core, midway of the cable, and through the entire length, cable and interpolated wire, 725 grains are lifted by the same 72 pair of plates. *The drawing out of an entire mile of the copper core to the amount of ten-elevenths of its entire thickness, only impairs its conducting capacity a thirty-seventh part.* It has been asserted that the copper core of the Atlantic cable will be drawn out *two feet in a mile*, and that this will destroy its transmitting power, so far as telegraph purposes are concerned. Mr Whitehouse replies by shewing, that if it were drawn out 96 feet in every mile, its loss of transmitting capacity would scarcely be remarked.

The external sheath of the cable is formed of twisted wires of iron, but those wires look to the eye absurdly fine for the task which is marked out for them; it seems as if a very few months' immersion in water would necessarily corrode them altogether away. If this corrosion should take place, what is to become of the denuded cable? The protecting investment being gone, what chance would the soft core within have of a prolonged existence of usefulness? Mr Bright, the engineer of the work, and the worthy coadjutor of Mr Whitehouse, has a very satisfactory answer for this question. The iron greatcoat of the cable may dissolve into rust, if it pleases; the very day after its strands have once been fairly deposited in the depths of the ocean; it is only designed to protect the more important portion of the cable during the process of laying down, and while it is exposed to accident from mechanical injury. When once this has reached its final resting-place, it will no longer require defence of any kind, because it will then be in the one situation of all others in the earth where it is the more fully withdrawn from every chance of hurtful interference. In the profound recesses of the Atlantic, there is no violence, and scarcely any motion; waves are but surface-ripples on the great oceanic reservoir; currents extend downwards only a few fathoms; anchors never obtrude themselves into these deep-sea realms, unless they fall to rise no more. The Atlantic cable will have the softest conceivable environments, for nothing can be more tranquil and calm than still water. Where the cable passes through a more accessible region, near to each shore of the ocean, it will be made of much larger dimensions, and of considerably greater strength.

There is one influence, however, which may reach the Atlantic cable, even in its retired bed, and affect it in a manner not at all desired by its projectors; here, indeed, is the real rub: great natural currents of electricity, coursing along within the earth's shell, may sympathetically disturb the insulated core, and occasionally preoccupy it with an induced charge, when it is required to be free and open to the performance of its ordinary business. If this should chance, it will be a troublesome matter, but not one by any means which science will not be able to meet. Antagonistic and neutralising currents will have to be furnished by art, to restore the equanimity of the central conductor, and to render it amenable to the will of the signaling-officers. The men who have

conceived this noble work, so bold and grand from its very slightness and simplicity, will be fully equal to any emergency of this kind which may arise.

A CATASTROPHE.

In social experiences, every one has had his catastrophes, some grave and painful to recur to, and sore to touch, even when the wound has apparently healed; others harmless in issue, and amusing to look back upon when they have passed away. Of the latter class, though very grievous at the time, was the occasion when, after a ball at a ladies' school in the country, to which I had accompanied the brother of my hostess, we were discussing over our bedroom fire, with agreeable freedom, the merits, personal and pecuniary, of our respective partners, a half-dressed servant handed in a scrap of paper conveying an intimation from the lady-superior that the girls in the next room—as well of course as herself, which we probably considered even more serious—could hear every word we said. Of such also was the hour when, having invited two friends whom I had encountered in Paris on their wedding-tour, to dine with me at Durand's, I walked up the Rue Lafitte on the morning of the day of festivity with no better means of exercising that hospitality than a five-franc piece, and an intimation from the English office at Rothschild's, that no communications being received by them from London on a Monday, the little remittance of which I had received advice, and which was to be the foundation of my feast, could not arrive until the day after it. But the most exquisite catastrophe with which my experience supplies me, arose out of a circumstance of a far graver character, if possible, than either of these; and which, laying my personal feelings wholly aside, I hereby put on record for the benefit and warning of the unwary.

'Fred, old boy, will you do me a favour?'

The applicant, 'Harry Spooner, St Benet's College,' Oxford, was a youthful swell with whiskers pendent as the nest of a tropical bird, and nether garments like pudding-bags, who honours me with his friendship and occasional patronage in Piccadilly; and in whose composition the bump of veneration, that fossil organ now-a-days, was not more largely developed than is usual with his contemporaries.

'You're going to the Shaftons on the 27th, are you not?'

'I rather thought of doing so. Was he?'

'Not asked, old boy; that's the rub—and that's what I wanted to speak to you about. Look here! You know how deucedly attached I am to Laura Heaviland!'

Devotedly would have been the expression, I thought, in the days when I adored—not that it is so long ago either—but sentiment has yielded to slang since then. Suppressing these views, however, which it would have been profitless to promulgate, I confined myself to a deprecatory acquiescence, for my friend had mentioned the circumstance before, more than once indeed, and with considerable details.

'Well, sir, the 27th is her birthday, don't you know? and I want to send her some verses—poetry, you know—that sort of thing. Charley Giltspur and I cobbled 'em up yesterday at the Wellington. I stood him a little dinner, and we did 'em up in the smoking-room. We had two "eye-openers," a "smash," and two "gin cocktails," and did 'em afterwards. I don't think they're out and out bad either. Well, sir, look here: the Heavilands will be safe to be in Harrington Street on the 27th, for they're intimate there, and here am I "scratched." Now, I want you, like a good fellow, to take charge of my little venture for me.'

'Me! Why on earth don't you send your verses by post? They're not too heavy, I hope?'

'Don't chaff, Fred, please. No, sir, they are not too

heavy! It isn't that; but, if you understood these things, your own tact, sir, would suggest to you that verses are not things to be sent by post.'

'Ah! I see—clause in the Post-office regulations which forbids the transmission through that medium of inflammable substances. Well, then, why don't you leave 'em yourself?'

'Yes, with a ticket, I suppose, and would be glad to know how the family are! It won't do, Fred, as you ought to know. Women are very fond of little attentions of this sort; whether they like you, mind you, or not, they like *them*. But they don't care twopence, sir, about a thing if they get it in a plain straightforward way. You must be up to all sorts of dodges with them, bless you.'

'Oh! that's the way, is it?' I rejoined, very favourably impressed with the knowledge of female character exhibited by Mr Spooner, who had scarcely attained his fourth lustrum.

'That's it, my boy! That's why I want you to take it in hand. I never saw such a fellow, by Jove! as you are, when you do really take anything in hand. I want you to insinuate my notelet into her bouquet, pin it on to her *bournoise*, wrap it up with a *praline*, or some gentle dodge of that sort. Bless you! it would be the making of me. They've six thousand apiece under the mother's settlement, and no brothers.'

'No brothers?'

'Yes! No brothers to be settled over and over again in life, and have their debts paid out of the daughters' fortunes. I always say to fellows: "Don't you have anything to say to any girls where there are brothers in the family; there's always sure to be a screw loose somewhere in the settlements, when the time comes to cash up." Bless you, sir, I've seen it dozens of times.'

Here my friend began to wander, a proceeding to which extensive experience of life apparently, and a somewhat erratic mind, occasionally induced him; but in which it is not necessary for us to follow him.

I have no partiality myself for the part of confidant in a love-affair, having, in my limited experiences, been present at the birth and in at the death of so many, as to have had my sense of the novelty and interest of the situations considerably impaired. How it was that my usual caution and reserve deserted me on the present occasion, I cannot tell. Whether the compliment to my diplomatic talents—for we are but mortal—had softened the natural ruggedness of my disposition; or whether, like the vicar of Wakefield, I was tired of being wise; or whether a glass of *parfait amour* with my coffee, for my friend had timed his request with great judgment, had rendered me more susceptible to the gentle passion, or more enterprising generally, I scarcely know. Certain it is that, after some objecting, I consented to play Mercury, 'for that night only, by particular request.'

The important evening duly arrived, and the important missive with it. The billet was done up with great art, and smelt copiously of perfume. About its contents I did not trouble myself, satisfied that Mr Spooner's *amour propre* would have insured such evidence in the work of the identity of the sender, as would relieve me from personal responsibility in regard to them; and I entered upon the scene of my diplomacy with all the air of Mr Charles Mathews in light comedy.

Any opportunity which the earlier portion of the evening might have afforded for effecting Mr Spooner's object was somehow lost. Whether it was that I had some little analogous business of my own to look after, which of course claimed precedence; or whether the enterprise may have assumed, as enterprises sometimes do, a less propitious aspect under the accompanying influences of cold blood, is not material. Certain it is, that the evening had warmed into geniality, and even

waned into repletion, before I became sensible of the necessity for action; or for some special interposition of Fortune on my client's behalf, if his commission were to be executed at all. We seldom lose, however, when we are playing a game in which our interest is small; it is only when we are throwing our whole heart or our last hundred that it is always *seizes* to *deuce-ace* against us. Having no absorbing interest in the present affair, and being aware of the above feminine principle on the part of her of the scales and bandage, I did not lose my faith in her assistance on the occasion, even at an hour when less skilled waiters upon providence would have given up the game as hopeless. And I had my reward! Did she not, at two o'clock in the morning, throw the charge of Miss Heaviland to her carriage into my hands; and prompt the benign: 'Oh, thank you! Can we not set you down anywhere?' from the good-natured 'she-dragon' who guarded that young lady, in which I read the successful consummation of my little enterprise. 'Could they not set me down?' Of course they could, Oxford Square being, as everybody knows, in the direct road from the Regent's Park to the Temple. Humming contentedly the Abbé l'Attaignat's

Dans un amoureux mystère
Un fiacre est un grand secours,

I entered upon the scene of action.

Glisser un billet is not difficult in a French drama, when Henriette (Rose Cheri) knows perfectly well that it is the rôle of Henri (Bresson) to convey to her the letter which no one is to see but the audience, and that she must have her left hand appropriately *posed* to receive it. *Glisser un billet*, if French novels are to be taken as pictures of society in France—and it is to be presumed they are—is not, in that favoured land, a difficult proceeding, even under direct marital or maternal supervision. But to slip a love-letter when the lady has *not* the cue, and under the ordinary conditions of everyday English life, is, I do hereby warn all enterprising readers of Parisian literature, and will maintain unto the death, a work of profound difficulty, and not to be lightly undertaken. At the same time, to tuck a note the size of a crown-piece, into a disorganised bouquet, thrown negligently beside one in the recesses of a family brougham, at two o'clock in the morning, with no witnesses to the dark deed but a drowsy chaperon and a day-dreaming beauty—for what beauty does not day-dream on her way home from a ball?—affords no great scope for the ingenuity, which I doubt not I should have been able to develop to admiration if the circumstances had demanded it.

'Assuredly,' said I to myself, as the business accomplished, I prepared to regale myself by my bedroom fire with a mild cigar, which, in the circumstances, I felt I had fairly earned—'assuredly, nature designed me for a diplomatist. There are no failures in life save through precipitancy or sloth. There is the right moment in every enterprise, though the patience to wait till it arrives, and the decision to act when it does, are perhaps the gifts of the few. Nine men out of ten,' I continued, as I felt in my pocket for a fusée, 'in such an affair as to-night's, would infallibly have muddled it.' Here the train of my meditations was suddenly broken; a gentle perspiration rose to my face; my heart fell like a thermometer in an ice-house, and commenced beating in my epigastrium, when, with feelings of the profoundest horror, I drew from my pocket, smelling luxuriously as ever, *Mr Spooner's billet-doux*.

I shuddered! An inevitable result rose with startling distinctness before my eyes. *Something* I had unquestionably tucked into Miss Heaviland's bouquet; and that something, whatever it was, that young lady was, in all probability—with her feet on the

fender, it might be, like myself, but alas! with what different feelings—at that moment, that melancholy moment, engaged in inspecting. What was that something? was the distracting problem now to be solved! What had I had in my pocket? Alas! what had I not? the receptacle in question being my invariable depository for all my correspondence until it became too bulky to be kept there any longer. First, I could distinctly remember a communication from my tailor, with a clean abstract of his bill before last, and a communication of the fact, that, if not settled, he would have to place it in the hands of his creditors. That didn't matter much. In these times, it was more than possible that the young lady herself might have had a milliner's bill of her own in the same category, and find comfort in a community of sorrow. Then there was—ah, miserable me!—an autobiographical letter of four pages from Paris, descriptive of the varied relaxations of that metropolis under the empire, from that villain Tom Raffington, who must needs embalm his delinquencies in black and white, to the everlasting confusion of my hitherto irreproachable character. Was there not a little dinner-bill too—not from a tavern in Eastcheap; but with as great a disproportion, almost, between the bread and the sack, as honest Falstaff's own: to say nothing of a double ticket for Madame de Montmorency's Full and Fancy Dress-ball at the Prince's Concert-rooms, with an intimation from the fair *beneficiaire* that that made three I owed her for? And a thousand times more distracting than all—yea, than all, said I, in the bitterness of my anguish—a skeleton epilogue, peppered with inharmonious jokelets, to be worked in afterwards, for some private theatricals at Brompton; and three draft impromptus, very rough, for a dinner-party the next evening in Gloucester Place! I, who had the reputation of doing these things so easily! One only comfort there was, the mysterious *something* could be but one of them; and to the investigation of which it was I now proceeded with a heavy heart. Tom Raffington's performance turned up first, and then the epilogue and impromptus. Fortune, I thanked thee! Madame de Montmorency and the tailor came up together; and to my unbounded astonishment, a further dive brought up the little dinner-bill also. The mystery remained unsolved: nothing was wanting; and yet the dreadful *something* was undoubtedly gone. The dread suspense renewed again seemed more dreadful than the knowledge of the direct conceivable reality. 'Present fears are worse than horrible imaginings.' In vain I ransacked my brain and rummaged my memory, lay awake all night, and walked about in a dream all the next day; all was fruitless. I met Miss Heaviland at dinner the following evening, when I let off my impromptus with unbounded success; but what was fame to me with black care at my heart-strings. The young lady made no sign, though I valiantly gave her more than one opportunity: this looked ominous. 'La femme qui ne veut s'apercevoir de rien, s'est aperçue de tout; il faut se tenir terriblement sur ses gardes avec elle,' says the French philosopher. I agreed with him and trembled.

There is a popular German tale, entitled the *Story without an End*. Would that I could emulate its incompleteness; but I have undertaken to make an example of myself for the benefit of the unwary, and am resolved to go to the stake like a hero. Some six months after the above incident, a flush of unexampled prosperity in my usually equal and modest fortunes, had the wholesome effect—not an invariable one of prosperity—of recalling to my recollection a period at the latter end of the preceding year when I chanced to be labouring under one of those temporary estrangements from the favour of the Diva Pecunia which occasionally vary the lot even of the sagest of

us. Now, at that period, I had been induced, I might almost say constrained—a circumstance for which I submit the aforesaid Diva Pecunia, and not I, must be held to be wholly and exclusively responsible—to set apart, or place away, or oppignerate, or hypothecate, or effect a mortgage by way of wadset; or, in the plain and simple vernacular, all circumlocution premitting and setting aside, to deposit temporarily, with equity of redemption, with one of that useful mercantile body trading under the insignia of the Lombards, a certain article of jewellery described in the duplicate or counterpart of the mortgage instrument as 'Ring, 30s.' Having, in a spirit of mistaken truthfulness, despised availing myself of any of those imaginary nomenclatures under which I am given to understand monetary operations of this nature are not unfrequently conducted, my real name and address was annexed, as well as, in bright-blue letters at the top, the style and designation of the merchant whom I had patronised on the occasion. Need I continue? Need I say that upon a search, in the hour of my prosperity, for this document, which I had carefully stowed away in a small envelope, it was not to be found! Must I, in so many words, admit the harrowing fact, that a comparison of the costume which I had worn on the only occasion in my life on which I had presented myself at three balls at a time with that in which I had had the honour of waiting upon Mrs Shafton on the evening I have mentioned, left no possibility of doubt in my mind that in lieu of Mr Spooner's billet-doux, I had endowed the fair object of his attachment with a *pawnbroker's duplicate*!

My confession is at an end, and carries its own moral. Fortunately, I was the only sufferer on the occasion, Miss Heaviland having, as I have since heard, consented, on the very evening, to share with Tom Shafton the L6000 and other reversions, to the attainment of which Mr Spooner had devoted the combined poetical capabilities of himself and Charley Giltspur, and the outlay of a little dinner, and other inspiring refreshments before alluded to. He is, however, I am happy to say, not heart-broken, and is, I believe, open to any overtures from any young lady of condition (these advances being now, I am given to understand, expected, by the ingenuous youth of the day, to be made by the weaker vessel) who can offer satisfactory evidence on the question of settlement, and has no brothers. It only occurs to me to add, that if by chance—and it is indeed of course most probable—Miss Heaviland should be a reader of this Journal, and should thus see this my confession, I should not feel that there was the slightest indelicacy—quite the contrary—in her enclosing to me (Pumphandle Court, Temple) anonymously, or in any other manner which the refinement of her feelings, or an advertisement in the second column of the *Times* might suggest, the—little document above referred to, which it is unnecessary for me again to particularise, and which is of no use to anybody but the owner.

ST GEORGE AND THE DRAGON.

ST GEORGE is the patron saint of England: at any rate, there is not one in the calendar who retains any noticeable influence on our affairs or our literature besides the victor of the Dragon. We could enumerate the historical worthies who have had their blunt English characters emblazoned on the celestial roll, and some others who, if they ever existed at all, have left none but saintly traces behind them. But neither the monkish saints, nor St Edward, nor St Thomas of Canterbury, can fairly contest the position unanimously assigned to the heroic and holy St George.

For more than six hundred years, St George has borne nearly the same relation to England that St Patrick has borne to Ireland. Our streets, docks, and hotels have been named after him; and while the earlier poets of our country have embalmed the saintly memory in immortal verse, our politicians have rendered his renown as permanent as our monarchical institutions, by agreeing to set up the Order of the Garter as the highest prize alike of diplomacy, state-service, and valour. But, after all, England is only an insignificant province of the vast realm which has, in the lapse of time, been conceded to the tateful of St George. We find whole countries in the old world and in the new called by his name. We find—strangely enough, as will presently appear—that the Roman Church consecrates its religious edifices by a name which represents no saint in their calendar. Protestant Germany rejoices in his patronage; Venice prefers his mythical way to that of St Mark. The professors of the oriental faith invoke him first among their apostles, prophets, martyrs, and saints. Russia accounts him as her Christian 'god of battles,' and the czar gives the Order of St George to those who can make out that they have not entirely succumbed to the valour of English, French, and Turkish heroes; who, in their turn, get the Order of St George on the supposition that they have trodden the Russian to the dust. Surely it is worth while to collect whatever is known of the man whose head Time has crowned with such dazzling honours; and if it be necessary, it may be still more interesting to trace the growth of a legend which has given rise to such strange and diverse reverence from so many different countries, and amongst various forms of faith. First, then, we will try to tell the genuine old legend as it would in all probability fall from the lips of an aged and enthusiastic Greek priest; then we will glean whatever is known of the real George; and, lastly, show how the fable and the history have been mixed together in the vague popular notion of the sainthood of George which all are familiar. Thus would the Greek priest tell his tale.

George of Cappadocia—so called either from his parents or from the school in which he was educated—was born in Cilicia. In youth, he was of fair and even lovely presence; as he grew up, he was known not less for brave deeds than for pure Christian faith. Being raised to the tribunate (military), and having received a summons to relinquish his furlough and join the eastern army of the emperor forthwith, he set forth on his travels. As he journeyed, he came near to a certain city of Libya. Now the sad case of that city was on this wise. Some few years before, a huge dragon had infested the city, breathing fire from his monstrous throat not only fire and smoke, but also plagues and death. The king of that city went forth to parley with the hideous enemy, and made a covenant with him, by which the city should supply to the foul beast two sheep daily, and the beast, on his part, abstain from his evil designs. All went well until there was no longer a sheep left. Then a second covenant was sealed, by which, to stay the beast's anger, the king agreed to sacrifice two virgins of his city daily. These maidens were chosen by lot, and many fair ones perished. At last, in an evil day, the fatal lot fell upon the king's only daughter, and the father would have saved the maiden; but the people rose up enraged, saying: 'We spared not our own flesh to feed the dragon, neither shall thy flesh be spared.' Nevertheless, the king would fain have saved his child; but she would not hearken to him, listening only to the voice of duty and of the people. Therefore

she went out to the dragon's den alone, that she might die for the people. As she was going towards the noisome cave in which the dragon dwelt, it was so that George drew nigh, and hearing the maiden weeping, he was troubled in heart; and having learned from her the cause of her sorrow, he bade her be of good comfort, for that he would slay the dragon. The maiden wept the more for such brave kind words, and sought to turn him from his purpose, saying that 'he would surely perish;' but George approached the dwelling of the monster; and when he saw the flame and smoke rushing from his gaping mouth, he called upon the sacred name, and drawing his good sword, sorely smote the dragon. Then taking from the maiden's neck a scarf delicately wrought, he bound it round the monster, and putting the scarf into the maiden's hand, he bade her lead the monster to the city-walls. There, in sight of all the wondering trembling people, he slew the fearful dragon. The king, when he learned that the name of Christ had wrought the wonder of his daughter's deliverance, was himself, with all his people, baptised in that name. The king, too, gave rich gifts to the warrior; but he, for his part, gave them all to the poor, and resisting all their entreaties, he went on his way, and was seen no more in those parts.

Journeying onwards, he came at length to Palestine, where he saw, for the first time, the cruel edict which Diocletian had put forth against the Christians. A copy of the decree was posted on the doors of the church to which he repaired for worship, and when his eye rested on the decree, his soul was moved with holy rage, and drawing his sword, he struck and tore down the imperial edict. Immediately he was seized and dragged before the prefect, who commanded him to offer sacrifice to the gods of the emperor. But this he could not do, and he was sent to the torture. They put him first into a cask full of sharp swords, and rolled him about, thinking they would cut him to death, but he was unhurt. Then the prefect sent unto him two cunning enchanters, who administered a deadly poison, which the warrior drank in the name of his Lord; and when they saw that no hurt followed the draught, the magicians themselves believed, and for their confession they were put to death. At last the angry governor bade his soldiers put the Christian to death by the sword; and George, knowing that his time had come, meekly bowed his head to the stroke, and gave up the ghost.

This is the beautiful fable from which the sanctity of George's two-sided character is derived: now let us glean a little in the harvest-field of history. The only man known as Cappadocian George was of humble parentage, and was bred to the pursuits of an honest trade. By dint of pleasing manners, and a certain energy of character, George succeeded in ingratiating himself with men of influence, by whose favour he was placed on the high road to fortune, as the selected contractor for bacon to the imperial army of the east. The temptations of this position had been felt long before his day, and most undoubtedly have continued in undiminished force up to the present hour. To enhance the profits of his contract, he bought up, and foisted upon the hapless soldiers, rusty bacon. He probably thought that the echo of their grumblings would not reach head-quarters; but he was mistaken. Not all the influence or wealth of himself and friends could save him from disgrace. He, too, like his shadow in the legend, set out upon his travels, and spent his money and leisure in a way that rather surprises us, considering his antecedents. He became a collector of books on a large scale, and has the singularly high honour of being amongst the first private individuals who invested their fortunes in libraries. This fascinating pursuit probably engaged him for some years; and it had this good effect upon his

fortunes—that it served to wear away the unfavourable impression left by his dishonesty.

But the crisis of his career was rapidly approaching. To understand this juncture of affairs, we must make a slight detour. It will be remembered that on the death of Constantine the Great, the empire was divided into two parts—Constans holding the sovereignty of the west, and Constantius that of the east. The eastern emperor embraced the Arian tenets, while the western emperor professed the Athanasian dogmas. Athanasius was the patriarch of Alexandria, and, in point of fact, he was, in all but the name, an independent sovereign over a large district. His nominal superior was Constantius, who hated and persecuted him under the combined motives of religion and politics. So long as Constans lived, Athanasius knew that he had a firm friend, and at least a refuge against extreme measures on the part of his enemy on the Byzantine throne. But when Constans died, the brother was no longer deterred from hurling his full weight of vengeance against the princely archbishop of Egypt; and once more he succeeded in driving Athanasius from Alexandria into the Libyan deserts. This local revolution was effected by, and in favour of, Cappadocian George, aided by one Sebastian. The accomplished book-collector—rather than the knavish bacon-factor—received episcopal consecration at the hands of an Arian synod, and, undertaking the civil as well as the ecclesiastical sceptre of the Great Exile, he soon displayed his real character in acts of the most unrighteous and cruel extortion. In this practice, he was unwisely indiscriminate. If he had suffered his religious prejudices to govern his exactions, it would have been safer for himself; but he laid his heavy hand upon all without distinction. Clamour, loud and continuous, made itself heard even at the imperial court; but the heart of Constantius was sore with the memory of the many occasions on which the city of Alexandria had stubbornly resisted his royal will; and he not only turned a deaf ear to all complaints, but actually encouraged his minion by eulogising his virtue and piety. All this was very hard to be borne, and the smothered hatred of the mighty city only waited for an opportunity to throw off its burden and signalise its vengeance. Constantius died, just in time to escape the dethronement which he had richly deserved at the hands of Julian. Julian is called the Apostate; but he never was anything but a pagan from first to last; so that the epithet apostate must be understood as indicating merely a reactionary policy. As a pagan, then, it was not at all likely that he would enter into the controversies and quarrels of Christians, unless for political purposes. But it was not at all a dispute in doctrine which lay between George and his spiritual flock: it was simply a question of taxes. The people had been cowed by the conviction that the Emperor Constantius would support his subordinate from considerations of religious opinion. So that as soon as they heard that the philosophic Julian had ascended the throne, they threw aside all fear, relied upon the simple justice of their cause, and, weary with vexation, proceeded to administer lynch-law upon the reckless tyrant of their city. They seized him, slew him, dragged his corpse through the streets on the back of a camel, and, finally, chopping it in pieces, threw it into the sea, lest by any chance his co-religionists should seek to further their own views at the expense of human justice, by exalting the tyrant to the dignity of a martyr, and his relics to the honours of adoration. They wished his name to be an offence for ever amongst men, if remembered at all. This is the true story of the only George known to history.

We next ask, how he came to be a martyr and saint, with so unusually splendid a halo round his brow? Shortly after his death, when his evil deeds had

pparently left no trace behind them, men of his own professed faith began to think of those points in which they agreed with him; and began, too, to think that he persecution they were experiencing had its type, if not its actual commencement, in the horrid death of their own bishop, George. They thought about it until the idea acquired probability, and talked themselves into a belief that it was true. Nothing was easier, in those days, than to pick up a few wild stray lowers of legendary poetry, and to weave them into a chaplet for some favoured hero. Early Attic history consists almost entirely of the same sort of fable as that which invests the name of St George; and if we look for the correspondence of the dragon, we are at least assisted in our search by a passage in the probably spurious 'Remains' of St George, which clearly indicates Athanasius as the dragon—at anyrate, the dragon is no insuperable difficulty in a case where polemics enter largely. When the Arians became absorbed into the Latin Church, it was policy to admit their saints along with them; George was accordingly canonised. On the other hand, when the entire calendar was revised by Pope Gelasius III., it appeared advisable to deprive George of his place in the calendar, and to assign him an honourable prominence amongst 'those decent, doubtful men, whose works are known to God rather than to men.' Further—as the separation between the Latin and the Eastern Churches became more and more decided—although there was not a formal division of the calendar, it was not unnatural that the two following principles should have something to do with the ultimate form of the calendar as held by the respective churches: First, each church would cherish a preference for the saints of its own growth; and second, in proportion to the lack of esteem evinced by the one church, would be the fervent adoration of the other church. Thus, the man whom the Latin Church had degraded, was by the Greek Church elevated to the highest rank. Hence it has happened that St George is the chief of the oriental saints, while he has no place in the western calendar, although his name is familiarly used in the consecration of Roman Catholic chapels (St George's Southwark, for example). From this statement, it is easily understood how all Russian patronage is vested in St George. We have still to account for the connection of St George with England; and this is the most probable explanation: When the British Crusaders—especially the Lion-hearted king—went forth to Palestine, they went under the protection of saints generally, but must have felt rather at a loss for a saint that they could call peculiarly their own. Other nations had their saintly badges and sacred banners, and spirit-stirring invocations: why not England? In the harbours of Greece and of the Archipelago, English ears would catch the melody in which the mariner chanted the praises of his martyred St George: and when Richard came to learn the story of the beloved saint, it was one to charm his fancy and to touch his heart. Seeing, then, that no western nation had recognised the glorious sainthood of George, he adopted the legend and the name as the model and type of his own intended exploits. His illustrious prowess reflected fresh interest on the legend—gave it, in fact, a new meaning. On his return to England, he fulfilled the substance of many a vow breathed amid the din of battle, by instituting the festival of St George in the year 1222.

When Edward III. instituted his Order of the Garter, he looked about, according to precedent, for a patron saint; and surely none worthier to be the head and fountain of England's decorative honour could have been found than he who was supposed—and believed in those days—to have inspired the marvellous achievements of the great *Cœur de Lion*. Thus it has come to pass that St George for Merry England

is the response to the cry 'St George for Holy Russia'; and thus may legends find a home in the hearts and characters of nations who do not believe one word of them.

SPARE MONEY.

ONE would suppose, from the clamours of frugal patriots in the House of Commons, that this was a country in a state of desperate poverty and embarrassment. Go in a deputation to the Treasury to plead for a few thousand pounds to accomplish some important public object; and, to judge by the response you get, it might appear as if the British community had not a spare penny beyond what was strictly required to keep square with its creditors, and support a handful of troops and ships. Yet, strange to say, we export a hundred and twenty millions of goods annually now, against about fifty millions' worth in 1841, and our ordinary national expenditure is not greatly beyond what it was forty years ago, while our population is not much less than doubled. Listen to Mr Williams of Lambeth and Mr Roebuck of Sheffield, and you would think it a great matter to save twenty-pence at any time to the nation; and then, again, go to dine with a merchant of London, or a manufacturer of Manchester, and you see a luxury in furniture, in eating, and in drinking, beyond anything of the kind that has ever been known in the world. A mercer of the latter town is said to have spent forty thousand pounds lately in decorating his country-house. One of its leading men went, not long ago, into a jeweller's shop with his wife, and spent in jewellery for her adornment a sum exceeding eleven hundred pounds. It is believed to be not uncommon for a Manchester married lady to spend eight hundred a year in dress. To give five hundred, seven hundred, or even a thousand for a single picture, while on the easel of a living artist, is no uncommon act of these merchant-princes. Parsimony seems to be a word only heard of in the House of Commons.

Leaving the House itself to explain how its prominent feelings and transactions so often do not represent any general sentiment or sense in the nation at large—which, however, we take leave to think is a very alarming thing for the House of Commons—we would fain say something about the positive fact of the great luxury here adverted to. We sympathise with the rewards of industry, and of course deprecate all interferences of the nature of sumptuary laws. We assert the right of each individual, be he a fortunate speculator, or only a clever artisan in the enjoyment of high wages, to spend his money as he pleases. But it is one thing to have a right, and another to use it rightly. When we see a man largely, perhaps suddenly enriched, and employing his wealth only in what ministers to his own or his family's personal gratifications—what solaces the appetites, the senses, or the vanities—we feel, and we are entitled to feel, somewhat shocked. Now, scarcely any rich man is wholly shut up against charities in this country. Few but subscribe to something, or disburse a little money when they hear of a case of extraordinary distress. But the question is, Do the rich, in general, make a right division between their own indulgences and the claims of humanity? Even in what they spend on themselves, it may be questioned, Do they, in general, spend wisely, or otherwise?

Our belief is, that the fortunate classes in general bestow far too much on the indulgence of appetite, caprice, and ostentation, compared with what a Christian humanity can approve of, and in doing so act unwisely even for themselves.

We will not attempt to excite a mere feeling on the subject by exhibiting the contrast between the home of superfluous wealth and the home of want, poverty

as that contrast must be in moving benevolent minds. We leave aside that moral obligation of the rich which was expressed in its extreme form in the injunction to the young man to sell off what he had and give it to the poor. We refrain for the present from remarks on that immoral glorification of wealth which tempts so many men into frauds and defalcations, that they may appear not less grand than certain of their neighbours, and prompts to a general vying one with another, in appearances which, after all, only provoke mutual jealousy, and never procure any real or permanent honour. We put the whole matter on simply rational ground. Beyond, we say, a certain moderate satisfaction to the immediate wants, money loses power in a rapidly increasing ratio. In other words, after the simplest needs are supplied, it takes always more and more to procure us any pleasure, either for the senses or the tastes. To illustrate what we mean, cream instead of milk to our tea—what may be purchased in favourable circumstances for a penny—will yield fully as much gratification as an additional wing to an already comfortable house. The first help to locomotion in the setting up of a one-horse carriage is more appreciated than afterwards will be the change to a first-class carriage with liveried servants. It often indeed happens that an extension in style, the setting up of a country-house in addition to one in town, the opening of intercourse with an aristocratic circle of society, is rather productive of discomfort than of true happiness. We have not, therefore, been surprised to hear various wealthy men declare that, after the first two thousand a year, they were sensible of little improvement in their position in this world. It might only have been added, that the serious needs of life may all be satisfied for much less than that sum, and long before so much has been attained, expenditure, in the generality of cases, takes the form of show instead of substance, and the spender feels that he is doing little to increase his own real enjoyments.

This is a rule, however, which does not apply when our abundance is employed in the gratification of the moral feelings. We may go on spending more and more of an overplus for the benefit of others, and find that in the luxury of doing good, as it has been well called, there is no such palling of the appetite as to dull the pleasure, or demand more and more to give us a sensation. Here, then, is the wise way of bestowing unneeded wealth.

But how? Many, in spending on costly luxuries, think they are doing good in the best possible way, by creating a gainful employment for the industrious classes. It is a most soothing unction to lay to their souls; but the immediate gratification proposed to themselves in the first place should of itself raise a suspicion of the soundness of the idea. The truth is, that to employ people in the making of anything not actually required or truly to be enjoyed, is to misapply means, seeing that the people would be supported by these means to better purpose in being set to work which was to redound to actual gratification, and always the more so if the gratification were that of a large instead of a small number, or if the resulting work were capable of being turned to some account in realising further means for human gratification.

To apply superfluous wealth to really good purpose calls for the exercise of great judgment in the consideration of circumstances. Direct relief of suffering, succour of the virtuous poor, claim and deserve a part. Means for that intellectual and moral advancement of the community which promises to diminish suffering and anticipate disaster in future, merit another and considerable portion. The general duty in the case is, that the fortunate part of the community—fortunate, it may be, in natural talent or self-denial—fortunate, perhaps, only in the course of circum-

stances—should seek to bring up the less fortunate in these respects as far as possible towards their own happy state—striving to do God's work on earth in the lessening of evil and the diffusion of good, and finding their all-sufficient reward in the joy reflected from the faces of their fellow-creatures. There is no equally great law over us here below, and positively no other method of indefinitely extending our enjoyment of life and its blessings. Everything else is bell-ringing, peacocks' feathers, tinsel, and trash.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XC VII.—SPEECHES IN COUNCIL.

'HIETANS!' began the chief, for such in reality was the old Indian, 'my children, and brothers in council! I appeal to you to stay judgment in this matter; I am your chief, but I claim no consideration for that; Wakono is my son, but for him I ask no favour; I demand only justice and right—such as would be given to the humblest in our tribe; I ask no more for my son Wakono. Wakono is a brave warrior: who among you does not know it? His shield is garnished with many trophies taken from the hated pale-face; his leggings are fringed with scalps of the Utah and Cheyenne; at his heels drag the long locks of the Pawnee and Arapaho. Who will deny that Wakono—my son Wakono—is a brave warrior?'

A murmur of assent was the response to this paternal appeal.

'The Spanish wolf, too, is a warrior—a brave warrior; I deny it not. He is stout of heart and strong of arm; he has taken many scalps from the enemies of the Hietan; I honour him for his achievements; who among us does not?'

A general chorus of grunts and other ejaculations from both council and spectators responded to this interrogatory. The response, both in tone and manner, was strongly in the affirmative; and I could tell by this that the renegade was the favourite.

The old chief also perceived that such was the prevailing sentiment, and, despite his pretensions to fair-play, he was evidently nettled at the reply. The father of Wakono was undoubtedly no Brutus.

After a momentary pause, he resumed speech, but in a tone entirely altered. He was now painting the reverse side of Hissoo-royo's portrait, and as he threw in the darker touches, it was with evident pique and hostility.

'I honour the Spanish wolf,' he continued; 'I honour him for his strong arm and his stout heart: I have said so; but hear me, Hietans—hear me, children and brothers! there are two of every kind—there is a night and a day—a winter and a summer—a green prairie and a desert plain, and like these is the tongue of Hissoo-royo. It speaks two ways that differ as the light from the darkness—it is double—it forks like the tongue of the rattle-serpent—it is not to be believed.'

The chief ceased speaking, and the Spanish wolf was permitted to make reply. He did not attempt to defend himself from the charge of the 'double tongue'; perhaps he knew that the accusation was just enough, and he had no reason to tremble for his popularity on that score. He must have been a great liar, indeed, to have excelled or even equalled the most ordinary story-teller in the Comanche nation; for the mendacity of these Indians would have been a match for Sparta herself.

The renegade did not even deny the aspersion: he seemed to be confident in his case; he simply replied:

'If the tongue of Hissoo-royo is double, let not the council rely upon his words; let witnesses be called; there are many who are ready to testify to the truth of what Hissoo-royo has spoken.'

'First hear Wakono! Let Wakono be heard! Where is Wakono?'

These demands were made by various members of the council, who spoke almost simultaneously.

Once more the crier's voice was heard calling 'Wakono!'

'Brothers!' again spoke the chief; 'it is for this I would stay your judgment. My son is not here; he went back upon the trail, and has not returned. I know not his purpose. My heart is in doubt—but not in fear. Wakono is a strong warrior, and can take care of himself. He will not be long absent; he must soon return. For this I ask you to delay the judgment.'

A murmur of disapprobation followed this avowal. The allies of the Spanish wolf evidently mustered stronger than the friends of the young chief.

The renegade once more addressed the council.

'What trifling would this be, warriors of the Hietan? Two suns have gone down, and this question is not decided! I ask only justice. By our laws, the judgment cannot stand over. The captives must belong to some one. I claim them as mine, and I offer witnesses to prove my right. Wakono has no claim, else why is he not here to avow it. He has no proofs but his own word; he is ashamed to stand before you without proof—that is why he is now absent from the camp.'

'Wakono is not absent,' cried a voice from among the bystanders; 'he is in the camp!'

This announcement produced a sensation, and I could perceive that the old chief partook equally with the others of the surprise thus created.

'Who says Wakono is in the camp?' inquired he in a loud voice.

An Indian stepped forth from the crowd of spectators. I recognised the man whom I had met crossing from the horse-guard.

'Wakono is in the camp,' repeated he, as he paused outside the circle. 'I saw the young chief; I spoke with him.'

'When?'

'Only now.'

'Where?'

The man pointed to the scene of our accidental rencontre.

'He was going yonder,' said he; 'he went among the trees—I saw him no more.'

This intelligence evidently increased the astonishment of all. They could not comprehend why Wakono should be upon the ground, and yet not come forward to assert his claim. Had he abandoned it altogether?

The father of the claimant appeared as much puzzled as any one; he made no attempt to explain the absence of his son: he could not; he stood silent, and evidently in a state of mystification.

Several now suggested that a search be made for the absent warrior. It was proposed to send messengers throughout the camp—to search the grove.

My blood ran cold as I listened to the proposal; my knees trembled beneath me. I knew that if the grove was to be searched, I should have no chance of remaining longer concealed. The dress of Wakono was conspicuous; I saw that there was none other like it: no other wore a robe of jaguar-skins, and this would betray me. Even the paint would not avail: I should be led into the firelight; the counterfeit would be detected. I should be butchered upon the spot—perhaps tortured for the treatment we had given the true Wakono, which would soon become known.

My apprehensions had reached the climax of acuteness, when they were suddenly relieved by some words from the Spanish wolf.

'Why search for Wakono?' cried he; 'Wakono knows his own name; it has been called, and loud enough. Wakono has ears—surely he can hear for himself, if he be in the camp. Call him again, if you will!'

This proposition appeared reasonable. It was adopted, and the crier once more summoned the young chief by name.

The voice, as all perceived, could have been heard to the furthest bounds of the camp, and far beyond.

An interval was allowed, during which there reigned perfect silence, every one bending his ears to listen. There came no answer—no Wakono appeared to the summons.

'Now!' triumphantly exclaimed the renegade, 'is it not as I have said? Warriors! I demand your judgment.'

There was no immediate reply. A long pause followed, during which no one spoke, either in the circle or among the spectators.

At length the oldest of the council rose, re-lit the calumet, and, after taking a whiff from the tube, handed it to the Indian seated on his left. This one, in like manner, passed it to the next, and he to the next, until the pipe had made the circuit of the fire, and was returned to the old warrior who had first smoked from it. The latter now laid aside the pipe, and in a formal manner, but in a voice inaudible to the spectators, proposed the question. The vote was taken in rotation, and was also delivered *sub voce*. The judgment only was pronounced aloud.

The decision was singular, and somewhat unexpected. The jury had been moved by a strong leaning towards equity, and an amicable adjustment that might prove acceptable to all parties.

The horse was adjudged to Wakono—the maiden was declared the property of the Spanish wolf!

CHAPTER XXVIII.

A ROUGH COURTSHIP.

The decision appeared to give satisfaction to all. A grim smile upon his face testified that the renegade himself was pleased. How could he be otherwise? He had certainly the best of the suit, for what was a beautiful horse to a beautiful woman, and such a woman?

Even the white-haired chief seemed satisfied. Perhaps, of the two, the old savage jockey preferred the horse? It might have been different had Wakono been upon the ground. I was much mistaken if he would so tamely have acquiesced in the decision.

Yes, the renegade was satisfied—more than that, he was rejoiced. His bearing bespoke his consciousness of the possession of a rare and much-coveted thing. He was unable to conceal the gratification he felt; and with an air of triumph and exultation, he approached the spot where the captive sat.

As soon as the sentence was pronounced, the Indians who had been seated rose to their feet. The council was dismissed. Some of the members strolled off on their own business; others remained by the great fire, mixing among their comrades, no longer with the solemn gravity of councillors, but chatting, laughing, shouting, and gesticulating as glibly and gaily as if they had been so many French dancing-masters.

The trial and its objects appeared to be at once forgotten; neither plaintiff, defendant, nor cause, seemed any longer to occupy the thoughts of any one. The horse had been delivered to a friend of Wakono—the maiden to Hissoo-royo—and the thing was settled and over.

Perhaps, here and there, some young brave, with a pain in his heart, may have bent wistful glances upon the lovely captive. No doubt there were many who looked with envious thoughts upon Hissoo-royo and his fortunes. If so, their emotions were concealed, their glances furtive.

After the council was over, no one interfered—no one seemingly took any interest either in the renegade or his pale-faced squaw; they were left to themselves.

And to me. From that moment, my eyes and

thoughts rested only on them; I saw no one else; I thought of nothing else; I watched but the 'wolf' and his victim.

The old chief had retired into the tent. Isolina had been left alone.

Only a moment alone. Had it been otherwise, I should have sprung forward. My fingers had moved mechanically towards my knife; but there was not time. In the next instant, Hissoo-royo stood beside her.

He addressed her in Spanish; he did not desire the others to understand what was said. Speaking in this language, there would be less danger.

There was one who listened to every word. I listened—not a syllable escaped me.

'Now!' began he, in an exulting tone—'Now, Doña Isolina de Vargas! you have heard? I know you understand the tongue in which the council has spoken—your native tongue. Ha, ha, ha!'

The brute was jeering her.

'You are mine—soul and body, mine; you have heard?'

'I have heard,' was the reply, in a tone of resignation!

'And surely you are satisfied; are you not? You should be. I am white as yourself—I have saved you from the embrace of a red Indian. Surely you are satisfied with the judgment?'

'I am satisfied.'

This was uttered in the same tone of resignation. The answer somewhat surprised me.

'Tis a lie!' rejoined the brutal monster; 'you are playing false with me, sweet señorita. But yesterday you spoke words of scorn—you would scorn me still?'

'I have no power to scorn you; I am your captive.'

'Carrambo! you speak truth. You have no power either to scorn or refuse me. Ha, ha, ha! And as little do I care if you did; you may like me or not at your pleasure. Perhaps you will take to me in time, as much as I may wish it; but that will be for your consideration, sweet señorita! Meanwhile, you are mine—body and soul you are mine, and I mean to enjoy my prize after my own fashion.'

The coarse taunt caused my blood, already hot enough, to boil within my veins. I grasped the hilt of my knife, and like a tiger stood cowering on the spring. My intent was, first to cut down the ruffian, and then set free the limbs of the captive with the blood-stained blade.

The chances were still against me. A score of savages were yet around the fire. Even should he fall at the first blow, I could not hope to get clear.

But I could bear it no longer; and would have risked the chances at that moment, had not my foot been stayed by some words that followed.

'Come!' exclaimed the renegade, speaking to his victim, and making sign for her to follow him—'Come, sweet señorita! This place is too public. I would talk with you elsewhere: I know where there are softer spots for that fair form to recline upon—pretty glades and arbours, choice retreats within the shadow of the grove. There, dearest, shall we retire. *Vamos!*'

Though hideous the signification of this mock-poetic speech, I joyed at hearing it; it arrested my hand and limb, both of which had been ready for action. It promised a better opportunity.

With an effort, therefore, I restrained myself, and resolved to wait.

I listened for the reply of Isolina; I watched her as well; I noted her every movement.

I saw that she pointed to her limbs—to the thong-fastenings around her ankles.

'How can I follow you?' she inquired, in a calm voice, and in a tone of surprise. Surely that tone was feigned? Surely she meditated some design?

'True,' said the man, turning back, and drawing the

knife from his belt. 'Carrai! I had not thought of that; but we shall soon.'—

He did not finish the sentence; he stopped in the middle of it, and in an attitude that betokened hesitation. In this attitude he remained a while, gazing into the eyes of his victim: then, as if suddenly changing his mind, he struck the knife back into its sheath, and at the same time cried out:

'By the Virgin! I shall not trust you. You are too free of limb, sweet *margarita!* you might try to give me the slip. This is a better plan. Come! raise yourself up—a little higher—so. Now we go—now for the grove. *Vamos!*'

While delivering the last words, the ruffian bent himself over the half-prostrate captive; and, placing his arm underneath, wound it around her waist. He then raised her upward until her bosom rested upon his—the bosom of my betrothed in juxtaposition with the painted breast of this worse than savage!

I saw it, and slew him not; I saw it, and kept cool—I can scarcely tell why, for it is not a characteristic of my nature. My nerves, from being so much played upon during the preceding hours, had acquired the firmness of steel; perhaps this enabled me to endure the sight—this, combined with the almost certain prospect of an improved opportunity.

At all events, I kept cool, and remained in my place; though only for a moment longer.

CHAPTER XCIX.

THE CRISIS.

The renegade having raised the unresisting captive in his arms, proceeded to carry her from the spot. He scarcely carried her; her feet, naked and bound, were trailing upon the grass, both together.

He passed the lodge, and was going towards the copse, in an oblique direction. The savages who saw him only shouted and laughed!

I waited neither to see nor hear more. Still keeping within the timber, I glided along its edge; with quick but noiseless step I went, making for the same point towards which the ruffian ravisher was tending.

I arrived first, and, stooping under the shadow of the trees, waited, with knife in hand, firm grasped and ready.

His burden had delayed him; he had stopped midway to rest, and was now standing scarcely ten paces from the edge of the grove, with the girl still in his arms, and apparently leaning against him.

There was a momentary wavering in my mind, as to whether I should not then rush forth, and strike the coup. The chance seemed as good as I might have.

I was about deciding in the affirmative, when I saw that Hissoo-royo had again taken up his burden, and was moving towards me. He was making directly for the spot where I stood. The crisis was near!

It was even nearer than I thought. The man had scarcely made three steps from the point of rest, when I saw him stumble and fall to the earth, carrying the captive along with him!

The fall appeared accidental. I might have deemed it so, but for the wild shout with which it was accompanied. Something more than a mere stumble elicited that fearful cry!

There was a short struggle upon the ground—the bodies became separated. One was seen to spring suddenly back; I saw it was Isolina! There was something in her hand—both moonlight and firelight gleamed upon a crimsoned blade!

She who grasped it bent for an instant downward—its keen edge severed the thongs from her limbs, and the moment after, she was running in full flight across the level sward of the camp-ground.

Without reflection, I sprang out of the covert and

rushed after. I passed the renegade, who had half-regained his feet, and appeared but slightly wounded. Astonishment as much as aught else seemed to hold him to the spot. He was shouting and swearing—calling for help, and uttering threats of vengeance.

I could have slain him, and was half-inclined to the act; but there was no time to stay. I only thought of overtaking the fugitive, and aiding her in her flight.

The alarm was given—the camp was in commotion—fifty savages were starting upon the chase.

As we ran, my eyes fell upon a horse—a white horse. It was the steed; a man was leading him by a lazo. He was taking him from the fires towards the ground occupied by the mustangs; he was going to picket him on the grass.

Horse and man were directly in front of us, as we ran—in front of the fugitive. She was making towards them; I divined her intention.

In a few seconds she was up to the horse, and had seized the rope. The Indian struggled, and tried to take it away from her; the red blade gleamed in his eyes, and he gave back.

He still clung to the rope, but in an instant it was cut from his hands, and, quick as thought, the heroic woman leaped upon the back of the steed, and was seen galloping away.

The Indian was one of the horse-guards, and was therefore armed; he carried bow and quiver. Before the horse had galloped beyond reach, he had bent his bow, and sent an arrow from the string. I heard the 'whEEP' of the shaft, and fancied I heard it strike; but the steed kept on!

I had plucked up one of the long spears as I ran across the camp. Before the Indian could adjust another arrow to the string, I had pinned him to the grass.

I drew back the spear, and, keeping the white horse in view, ran on.

I was soon in the midst of the mustangs; many of them had already stampeded, and were galloping to and fro over the ground. The guards were dismayed, but as yet knew not the cause of the alarm. The steed with his rider passed safely through their line.

I was following on foot. Fifty savages were after me; I could hear their shouts.

I could hear them cry 'Wakono,' but I was soon far in advance of all. The horse-guards, as I passed them, were shouting 'Wakono!'

As soon as I had cleared the horse-drove, I again perceived the steed; but he was now some distance off. To my joy, he was going in the right direction—straight for the yuccas upon the hill. My men would see and intercept him.

I ran along the stream with all speed. I reached the broken bank, and, without stopping, rushed into the gully for my horse.

What was my astonishment to find that he was gone!—my noble steed gone, and in his place the spotted mustang of the Indian! I looked up and down the channel; I looked along its banks—More was not in sight.

I was puzzled, perplexed, furious. I knew no explanation of the mystery—I could think of none. Who could have done it? Who? My followers must have done it? Rube must have done it? but why? In my hot haste, I could find no reason for this singular action.

I had no time to reflect—not a moment. I drew the animal from the water, and leaping upon his back, rode out of the channel.

As I regained the level of the plain, I saw mounted men, a crowd of them coming from the camp. They were the savages in pursuit; one was far ahead of the rest, and before I could turn my horse to flee, he was close up to me. In the moonlight I easily recognised him—it was Hissoo-royo the renegade.

'Slave!' shouted he, speaking in the Comanche tongue, and with furious emphasis, 'it is you who have planned this. Squaw! coward! you shall die! The white captive is mine—mine, Wakono! as you'—

He did not finish the sentence. I still carried the Comanche spear; my six months' service in a long regiment now stood me in stead; the mustang behaved handsomely, and carried me full tilt upon my foe.

In another instant the renegade and his horse were parted; the former lay levelled upon the ground transfixed with the long spear, while the latter was galloping riderless over the plain!

At this crisis I perceived the crowd coming up, and close to the spot. There were twenty or more, and I saw that I should soon be surrounded.

A happy idea came opportunely to my relief. As long I had observed that I was mistaken for Wakono! The Indians in the camp had cried 'Wakono!'; the horse-guards shouted 'Wakono' as I passed; the pursuers were calling 'Wakono' as they rode; the renegade had fallen with the name upon his lips: the spotted horse, the robe of jaguar-skin, the plumed head-dress, the red hand, the white cross, proclaimed me Wakono!

I urged my horse forward, and reined up in front of the pursuers. I raised my arm, and shook it in menace before their faces; at the same instant I cried out in a loud voice:

'I am Wakono! Death to him who follows!'

I spoke in Comanche. I was not so sure of the correctness of my words—either of the pronunciation or the syntax—but I had the gratification to perceive I was understood. Perhaps my gestures helped the savages to comprehend me—the meaning of these words was not to be mistaken.

From whatever cause, the pursuers made no further advance; but one and all, drawing in their horses, halted upon the spot.

I stayed not for further parley, but, wheeling quickly round, galloped off as fast as the mustang could carry me.

CHAPTER C.

THE LAST CHASE.

On facing towards the hill, I perceived the steed not so distant. His white body, gleaming under clear moonlight, could have been easily distinguished at a far greater distance. I had expected to see him much further away; but, after all, the tilt of his mane and the menace delivered to the pursuing horse had scarcely occupied a score of seconds, and he was not in the time have gone out of sight.

He was still running between myself and the foot of the hill—apparently keeping along the bank of the stream.

I put the Indian horse to his full speed. The point of my knife served for whip and spur. I was no longer encumbered with the spear; it had been left in the body of Hissoo-royo.

I kept my eyes fixed upon the steed, but he was closing in to the timber that skirted the base of the hill; he was nearing the bend where I had taken the water, and would soon be hidden from my view behind the bushes.

All at once I saw him swerve, and strike away to the left, across the open plain. To my surprise I did this, for I had conjectured that his rider was aiming to reach the cover offered by the thicket.

Without waiting to think of an explanation, I had the mustang into the diagonal line, and galloped forward.

I was in hopes of getting nearer by the advantage thus given me, but I was ill satisfied with the comparative pace of the Indian horse, so unlike the long, swift

stretch of my noble Moro. Where was he? Why was I not bestriding him?

The white steed soon shot clear of the hill, and was now running upon the plain that stretched beyond it.

I saw that I was not gaining upon him; on the contrary, he was every moment widening the distance between us. Where was Moro? Why had he been taken away?

At that instant I perceived a dark horseman making along the foot of the ridge, as if to intercept me; he was dashing furiously through the thicket that skirted the base of the declivity. I could hear the bushes rattling against the flanks of his horse; he was evidently making all the haste in his power, at the same time aiming to keep concealed from the view of any one upon the plain.

I recognised my horse, and upon his back the thin, lank form of the earless trapper!

We met the moment after, at the point where the thicket ended. Without a word passing between us, both simultaneously flung ourselves to the ground, exchanged horses, and remounted. Thank Heaven! Moro was at last between my knees!

'Now, young fellow!' cried the trapper, as I parted from him, 'gallip like durnation, an kitch up wi' her! We'll soon be arter on yur trail—all right thur. Away!'

I needed no prompting from Rube; his speech was not finished before I had sprung my horse forward, and was going like the wind.

It was only then that I could comprehend why the horses had been changed; a *ruse* it was—an afterthought of the cunning trappers! Had I mounted my own conspicuous steed by the camp, the Indians would in all probability have suspected something, and confined the pursuit; it was the spotted mustang that had enabled me to carry out the counterfeit!

I had now beneath me a horse I could depend upon; and with renewed vigour I bent myself to the chase. For the third time, the black and white stallions were to make trial of their speed—for the third time was it to be a struggle between these noble creatures.

Would the struggle be hard, and long? Would Moro again be defeated? Such were my reflections as I swept onward in the pursuit.

I rode in silence; I scarcely drew breath, so keen were my apprehensions about the result.

A long start had the prairie-horse. My delay had thrown me far behind him—nearly a mile. But for the friendly light, I should have lost sight of him altogether; but the plain was open, the moon shining brightly, and the snow-white form, like a meteor, led me onward.

I had not galloped far, before perceiving that I rapidly gained upon the steed. Surely he was not running at his fleetest? Surely he was going more slowly than was his wont?

Oh! could his rider but know who was coming after!—could she but hear me! I would have called, but the distance was still too great. She could not have heard even my shouts; how could she distinguish my voice?

I galloped on in silence. I was gaining—constantly and rapidly gaining. Surely I was drawing nearer? or were my eyes playing false under the light of the moon?

I fancied that the steed was running heavily—slowly and heavily—as if he was labouring in the race. I fancied—no, it was no fancy—I was sure of it! Beyond a doubt, he was not going at his swiftest speed!

What could it mean? Was he broken by fatigue?

Still nearer and nearer I came, until scarcely three hundred yards appeared between us. I fancied that my shouts might be heard, that my voice—

I called aloud; I called the name of my betrothed, coupling it with my own; but no answer came back—the sign of recognition to cheer me.

The ground that now lay between us favoured a race-course speed; and I was about putting my horse to his full stretch, when, to my astonishment, I saw the steed stagger forward, and fall headlong to the earth!

It did not check my career, and in a few seconds more I was upon the spot, and halting over horse and rider, still prostrate.

I flung myself from the saddle, and drew nearer. Isolina had disengaged herself, and risen to her feet. With her right hand clasping the red knife, she stood confronting me.

'Savage! approach me not!' she cried in the Comanche tongue, and with a gesture that told her determination.

'Isolina! I am not—— It is'——

'Henri!'

No words interrupted that wild embrace; no sound could be heard save that made by our hearts, as they throbbed closely together. * * *

Silently I stood upon the plain with my betrothed in my arms. Moro was by our side, proudly curving his neck and chafing the steel between his foaming lips. At our feet lay the prairie-horse with the barb in his vitals, and the feathered shaft protruding from his side. His eyes were fixed and glassy; blood still ran from his spread nostrils; but his beautiful limbs were motionless in death!

Horsemen were seen approaching the spot. We did not attempt to flee from them: I recognised my followers.

We looked back over the plain; there was no sign of pursuit; but for all that, we did not tarry there. We knew not how soon the Indians might be after us; the friends of Hiscoo-royo might start forth upon the trail of Wakono!

It was near daybreak when we halted to rest, and then only after the prairie had been fired behind us.

We found shelter in a pretty grove of acacias, and a grassy turf on which to repose. My wearied followers soon fell asleep.

I slept not; I watched over the slumbers of my betrothed. Her beautiful head rested upon my knees; her soft damask cheek was pillowed upon the robe of jaguar-skins, and my eyes were upon it. The thick tresses had fallen aside, and I saw——

The matador, too, had been merciful! or had gold bribed him from his cruel intent? No matter which! he had failed in his fiendish duty. There in full entirety were those delicate organs—perfect, complete. I saw but the trifling scar where the gold circlet had been rudely plucked—the source of that red hemorrhage that had been seen by Cyprio!

I was too happy to sleep.

It was our last night upon the prairies. Before the setting of another sun, we had crossed the Rio Grande, and arrived in the camp of our army. Under the broad protecting wings of the American eagle, my betrothed could repose in safety until that blissful hour when——

* * * * *

Of the Comanches we never heard more. The story of one only was afterwards told—a fearful tale. Ill-fated Wakono! A horrid end was his.

An oft-told tale by the prairie camp-fire is that of the skeleton of an Indian warrior found clasping the trunk of a tree! Wakono had horribly perished.

We had no design of giving him to such a fate. Without thought had we acted; and though he may have deserved death, we had not designed for him such terrible retribution. Perhaps I was the only one who had any remorseful feeling; but the remembrance of that scalp-bedecked shield—the scenes in that Cyprian grove—those weeping captives, wedded to a woful lot—the remembrance of these cruel realities evermore rose

before my mind, stifling the remorse I should otherwise have felt for the doom of the ill-starred savage. His death, though terrible in kind, was merited by his deeds, and was perhaps as just as punishments usually are.

Poetical justice demands the death of Ijurra, and by the hand of Holingsworth. Truth enables me to satisfy the demand.

On my return to the camp, I learned that the act was already consummated—the brother's blood had been avenged!

It was a tragic tale, and would take many chapters in the telling. I may not give them here. Let a few particulars suffice.

From that dread night, Holingsworth had found a willing hand to aid him in his purpose of retribution—one who yearned for vengeance keenly as himself. Wheatley was the man.

The two, with a chosen party, had thrown themselves on the trail of the guerrilla, and with Pedro as their guide, had followed it far within the hostile lines. Like sleuth-hounds had they followed it night and day, until they succeeded in tracking the guerrilleros to their lair.

It was a desperate conflict—hand to hand and knife to knife—but the rangers at length triumphed; most of the guerrilleros were slain, and the band nearly annihilated.

Ijurra fell by Holingsworth's own hand; while the death of the red ruffian El Zorro, by the bowie knife of the Texan lieutenant, was an appropriate punishment for the cruelty inflicted upon Conchita. The revenge of both was complete, though both still bore the sorrow within their hearts.

The expedition of the two lieutenants was productive of other fruits. In the head-quarters of the guerrilla they found many prisoners, Yankees and Ayankieados—among others, that rare diplomatist Don Ramon de Vargas. Of course the old gentleman was released from captivity, and had arrived at the American camp, just in time to welcome his fair daughter and future son-in-law from their grand ante-hymeneal 'tour upon the prairies.'

THE END OF THE WAR-TRAIL.

THE MONTH:

SCIENCE AND ARTS.

JUNE, as usual, has brought the beginning of a holiday alike to school-boys and philosophers—the learned societies have wound up their sessions, and the gray-beards, leaving science to take care of herself for a while indoors, are cogitating over the best way of making recreation enjoyable. Some will go dredging; some botanising; some insect-hunting; some on geological explorations; some to visit savans abroad; and not a few have matter in hand for the British Association, which is to meet in Dublin on the 26th of August.

Promising circumstances attended the winding-up. Dr Tyndall gave a course of lectures at the Royal Institution, 'On Sound and some Associated Phenomena.' Professor Huxley enlightened an audience at the same place concerning neural phenomena, and told them it was an error to believe that nervous action and electric action are, as some suppose, identical. Sir H. Rawlinson discoursed also at the same place, and before the Geographical Society, on Persia and the Persians; and Mr Paget, lecturing 'On the Rhythmic Action of the Heart' to the Royal Society, gave a summary of what is known on the subject, and drew broad philosophical conclusions therefrom, as became one who ranks among the ablest of physiologists. The president of the Institution of Civil Engineers, Mr Robert Stephenson, invited some 800 or 900 of the learned,

the scientific, and mechanical, to a conversation, in which, though the throng was great and the temperature uncomfortable, good things were spoken and excellent things shown. Among the latter were certain glass tubes bulbous at one end, in which Mr Appold shewed that water may easily be frozen even in a hot room. He produces ice, and thaws it again and again, in presence of all beholders. And there was shewn the *Nautilus*, a newly invented machine or diving-bell, which appears admirably adapted for working under water. The model rose and fell in its glass cistern, shewing how great stones might be lowered and deposited, in a way that seems to have something magical about it. According to the inventor's description, 'it is entirely independent of suspension; its movements are entirely dependent on the will of them within it, and without reference to those who may be stationed without. It possesses the power of lifting large weights *per se*, and at the same time is perfectly safe, by common care, in its operations—this latter the greatest desideratum of all. The form of the machine is not arbitrary, but depends entirely on the nature of the work to be performed, adapting itself to the various circumstances attending any given position. The shape of the model exhibited is a flat oval, the base smaller than the crown, with a domed roof; and the interior partitioned into several chambers. Unlike the ordinary diving-bell, it is so constructed as to float on the surface.

The workman enters through a valved opening in the roof, turns a tap, water flows into a chamber, and by its weight causes the descent of the machine. At the same time, air is admitted by a flexible tube from the receiver of a steam air-condensing pump at the surface, the air in which has been brought 'to a density somewhat greater than that of the water at the depth it is proposed to attain.' Air and water gauges indicate to the workman the density of the air, and the exact lifting-power that may be employed in the laying of stones or removal of wreck or heavy objects from the bottom. The construction of the machine is such, that by discharging the water-bellows and regulating the valves, enormous weights, many tons, may be raised with scarcely an effort. In calm water, the workman steps out and pushes it from place to place with his hands; but in tides and currents, it is moved and steadied by cables. Will the American engineers who have engaged to raise the sunken ships in Sebastopol harbour make use of the *Nautilus*?

Professor Edmund Davy has read a paper to the Royal Dublin Society on a cement which he obtained by melting together in an iron vessel two parts by weight of common pitch with one part of gutta-percha. It forms a homogeneous fluid, which is much more manageable for many useful purposes than gutta-percha alone, and which, after being poured into cold water, may be easily wiped dry and kept for use.

'My first trials with this cement,' says the professor, 'put it to a very severe test. I used it as a substitute for plumber's solder in repairing the lead gutters on the roof of my house, which were cracked in several places, and admitted water freely; and also to stanch the leaks in an old common forcing-pump, attached for yielding a supply of water for the use of two houses, and raising it about thirty feet. For these purposes, I found it quite efficient. All that was necessary in the case of the gutters was to remove with a brush all loose earthy matters from the cracked lead, slightly warm it with a hot iron, then pour the cement in a fluid state on the cracks, so as to cover them on both sides.' The pump was repaired with equal success, the leaks being first wiped dry; and the professor continues: 'I entertain no apprehension that the warmth of our climate at any time will impair the efficacy of this cement, which

applied to repair lead, zinc, or iron gutters; for though it softens at a comparatively low temperature, it still adheres most tenaciously to metals and other substances, and does not allow water to pass through it.' Vessels of any kind may be similarly patched or repaired, and be ready for use in a few hours afterwards; and wet metallic surfaces may be joined as well as dry ones, if they are warm. And further, to quote again from the paper, the cement 'adheres with the greatest tenacity to wood, stones, glass, porcelain, ivory, leather, parchment, paper, hair, feathers, silk, woollen, cotton, linen fabrics, &c. It is well adapted for glazing windows, and as a cement for aquariums. As far as my experience has yet extended,' adds Professor Davy, 'the cement does not appear to affect water, and will apparently be found applicable for coating metal tanks; to secure the joints of stone-tanks; to make a glue for joining wood, which will not be affected by damp; to prevent the depredation of insects on wood. The heavy oak beams and rafters in the roof of the Royal Dublin Society are attacked to a considerable extent by insects—as the weevil, &c. As this cement is soluble in volatile oils, an application of a solution of the cement in turpentine or naphtha might be beneficial, and arrest the ravages of the insects. It may be highly deserving of inquiry whether the cement may not be applied to preserve surfaces of metal and wood exposed to the atmosphere, and to fresh water; also to protect anchors, chain-cables, &c., from the corroding agencies of sea-water.' We doubt not that due advantage will be taken of Professor Davy's experiments and suggestions.

The Linnæan Society, who are now comfortably lodged by side of the Royal Society in Burlington House, held their anniversary meeting very happily in their new quarters. In the last published part of their *Proceedings*, there is some interesting information concerning certain trees of Western Africa which produce the gum used in the making of copal varnish; and on the Timbuctoo palm, seedlings of which are eaten either raw or roasted by the negroes, the tree itself being felled to procure its sugar. In India, the natives accomplish the same object by merely wounding the spadix, and collecting the sap as it flows; and on this point Dr Seemann remarks: 'The wanton destruction of the trees by the one party, and the careful husbanding of them by the other, is the reason why Africa and America have never furnished, and as long as the present process of destruction is continued, will never furnish any palm-sugar—a product of which Asia sends to Europe alone several thousand tons annually.'—Another fellow of the society, Rev. M. J. Berkeley, has a 'Note on the Use of the Rhizoma of *Pteris aquilina* as an Article of Food,' in which, after explaining that the root of this species of fern abounds in starch and mucilage, and is used as food in Northern Europe, Siberia, Normandy, and New Zealand, he says: 'Having lately had occasion to examine the rhizoma of our common *Bracken*, it became a matter of interest to ascertain what sort of food might be afforded by it. I accordingly roasted some of the rhizomata, and found them edible, but extremely disagreeable from their slimy consistence and peculiar flavour, in both of which respects they precisely resemble ill-ripened brinjals. It struck me, however, that they might afford a better food if the slimy matter could be removed. I accordingly scraped some of the rhizomata, which had been first washed and peeled, avoiding, however, the two columns of hard coloured tissue with which they are threaded, and then placed the pulp thus obtained in water. After four-and-twenty hours, the water had become extremely slimy, and of a yellow brown. This was carefully decanted, and the pulp washed again with water, which was now quite colourless. This was also decanted, and the pulp, when sufficiently dry,

was kneaded into a cake, and baked upon the hearth. The result was a coarse but palatable food, perfectly free from any disagreeable flavour—much better, indeed, to my taste, and probably not less nutritious than cassava-bread.' Whether nurture and cultivation would effect any such change on fern-roots as on the wild parsnip, we do not know, but it might be worth while to try a course of experiments.

The food-question is so pre-eminently interesting, that we may be pardoned for devoting to it another paragraph or two. In the *Journal of the Canadian Institute*, Mr Paul Kane of Toronto, gives an account of his travels among the Chinook Indians, who inhabit a portion of the north-west coast of America and of Vancouver's Island—a region to which many an eager eye is now cast in anticipation of the expiry of the Hudson's Bay Company's charter. Mr Kane states: 'The only vegetables in use among the Chinooks are the *Camas* and *Wappattoo*. The *Camas* is a bulbous root, much resembling the onion in outward appearance, but is more like the potato when cooked, and is very good eating. The *Wappattoo* is somewhat similar, but larger, and not so dry or delicate in its flavour. They are found in immense quantities in the plains in the vicinity of Fort Vancouver, and in the spring of the year present a most curious and beautiful appearance, the whole surface displaying an uninterrupted sheet of bright ultramarine blue from the innumerable blossoms of these plants. They are cooked by digging a hole in the ground, then putting down a layer of hot stones, covering them with dry grass, on which the roots are placed. The hole is then closed by another layer of grass and of earth, perforated by a small orifice, through which water is poured, and immediately closed; and the water on reaching the hot stones is converted into steam, which in a short time completely cooks the roots.'

We have heard that a new way of making bread has been successfully tried at the great biscuit-factory at Carlisle. According to a statement in the *Times*, the process 'consists in compressing the air in the vessel in which the flour is contained before admitting the water charged with gas (carbonic acid?), so as to prevent the escape of the gas before the process of mixing or kneading is completed. It is said that the bread can thus be made with perfect precision of any degree of lightness, and that, owing to the avoidance of the waste consequent upon the chemical changes which take place during the course of fermentation, an economy of 10 per cent. will be effected.'

The Earl of Ducie has communicated a suggestive paper to the Scottish Arboricultural Society, 'On the Effects of Geological Position on Certain Coniferae,' from which planters of fir-trees, especially of foreign kinds, may take a hint. As a general rule, he remarks, the trees thrive best in proportion to the depth of surface-soil on which they stand; strikingly shewn by the *Deodar* and *Pinus insignis*. The former is described as 'the most accommodating of all the Coniferae. No position and no variety of soil appear to come amiss to it; on lime or sandstone, rock or clay, it grows with equal facility.' The *Abies Douglasii* also grows as vigorously on the cold and sterile shales of the carboniferous limestone, as on the deep and warm soil of the Old Red Sandstone. On the other hand, the earl notifies: 'The most fastidious of the Coniferae which I have had an opportunity of observing, is undoubtedly *Cryptomeria japonica*. On the limestone, its leading shoot is always defective, and its growth generally devoted to the formation of a nest-like mass of small shoots; while on the Old Red, a formation deficient in lime, its growth is regular, upright, and graceful, and so rapid, that I have no hesitation in affirming that in this locality it would outgrow the larch.' The earl's experiments have been made at Tortworth Park, Gloucestershire: as yet, they are

too few to furnish positive data; and we would suggest that planters in other parts of the kingdom might render good service to arboriculture by further experiments and observations, and making them publicly known.

The attention of mariners, particularly of those navigating the Baltic, has been called to the published charts, many of which are defective in giving the true variation of the compass needle. The variation, or departure to the west of the true north, as is generally known, reached its maximum, 24 degrees, in 1836; and since then it has been going back towards the east at the rate of from 6 to 7 minutes a year. Consequently, unless proper allowance be made for the effect of this change, navigation becomes doubly hazardous; and now, that the Sound dues are abolished, there will probably be a greater number of ships than ever trading to the Baltic.

The navigation returns for 1856, recently published, afford a few items which we think remarkably instructive. The number of British vessels entered coastwise in England, during the year, was 93,238—an aggregate of 7,253,608 tons; and 262 foreign vessels, 45,901 tons. In the same year, 106,896 British vessels, 8,170,971 tons, and 85 foreigners, 14,602 tons, cleared outwards. Of steamers, 13,143 British, 3,045,612 tons, and 19 foreign, 4025 tons, entered inwards; and 12,964 British, 2,938,239 tons, and 29 foreign, 5589 tons, cleared outwards. The trade of the United Kingdom employs 26,029 British ships, 6,390,715 tons; and 20,744 foreign, 4,480,859 tons. And to these we add a fact worth record: it is now ordered that all transport-ships shall be fitted with Clifford's apparatus for lowering boats. Every trial, whether with ships at anchor or under full sail, but serves to prove the excellence and utility of this contrivance.

Astronomy is likely to be further cultivated in the southern hemisphere, for we hear that an observatory is to be erected on a rocky hill overlooking Sydney harbour, in a situation where the time-ball can be seen by all vessels at the anchorage. And before long, we shall have to report that an electric telegraph has been set up from Sydney to Melbourne. The colony is making progress. According to the census returns of 1856, the population of New South Wales was 266,000, numbering 147,000 males, and 119,000 females; of whom 80,000 are inhabitants of Sydney.

Liverpool and Manchester have held a meeting to consider the question of increasing the supply of cotton.—A successful attempt has been made to light a railway train with gas, adopted from the United States. Each train carries a gasometer, and the apparatus is so contrived that the gas can be turned off from any one carriage at pleasure.—Satisfactory experiments have been made at Woolwich to test Abbé Pauvert's method of making steel from old refuse and scraps of iron, equal to that produced from the best Swedish iron. It employs certain 'chemical ingredients and electric agency,' and causes no waste, for a ton of iron yields a ton of steel.

THE PATH THROUGH THE SNOW.

BARE and sunshiny, bright and bleak,
Rounded cold as a dead maid's cheek,
Folded white as a sinner's shroud
Or wandering angel's robe of cloud—

I know, I know,
Over the moor the path through the snow.

Narrow and rough it lies between
Wastes where the wind sweeps, biting keen,
And not a step of the slippery road
But marks where some weary foot has trod;
Who 'll go, who 'll go,
After the rest in the path through the snow?

They who would tread it must walk alone,
Silent and steadfast, one by one;
Dearest to dearest can only say:
'My heart! I follow thee all the way,
As we go, as we go,
Each after each in the path through the snow.'

It may be under that glittering haze
Lurks the promise of golden days,
That each sentinel tree is quivering
Deep at its core with the blood of spring,
And as we go, as we go,
Green blades are piercing the frozen snow.

It may be the unknown path will tend
Never to any earthly end,
Die with the dying day obscure,
And never lead to a human door,
That none know who did go
Patiently once, on this path through the snow.

No matter—no matter! The path shines plain,
The pure snow-crystals will deaden pain:
Above, like stars in the deep blue dark,
Guiding spirits will stand and mark;
Let us go, let us go,
Whither Heaven leads in the path through the snow!

NOTICE.

A NEW TALE,

ENTITLED

KIRKE WEBBE, OR THE PRIVATEER.

BY THE AUTHOR OF 'REMINISCENCES OF A BARRETT,'
'RECOLLECTIONS OF A POLICE-OFFICER,' &c.

Will be commenced on Saturday, 1st August, and continued
Weekly until completed.

The present number of the Journal completes the Seventh Volume, for which a title-page and index have been prepared, and may be had of the publishers and their agents.

END OF SEVENTH VOLUME.

Printed and Published by W. and R. Chambers,
47 Paternoster Row, London, and 339 High Street, Edinburgh.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 183.

SATURDAY, JULY 4, 1857.

PRICE 1½d.

THE BRIDE'S JOURNEY.

On the banks of the river Lerg, where it forms its estuary with the Great Fiord of the North Sea, stood the quaint old town of Lerwig—a place that seemed from the rude harmony that characterised the buildings, to have sprung ready fashioned, ages before, out of the primeval forest. So primitive was its whole aspect, that, but for the vanity of each proprietor, who had branded his initials and the year of erection in iron hooks over the chamber-window, the spectator might have fancied the whole the work of a single night.

Tall narrow houses of timber, with their overhanging gables towards the street, rudely carved, but warped in every conceivable manner, extended in two lines parallel to the river; while smaller streets, diverging north and south, led to the heavy wharfs and store-houses lining the primitive harbour, or to the few detached mansions that, standing in their own grounds, constituted the fashionable quarter, and comprised the wealth and aristocracy of the ancient burg. In the centre of the main street, and built, like the town itself, of timber, stood the venerable church, or what had once been the cathedral, a perfect marvel of picturesque architecture, from the stern Runic to the florid Norman. Not a foot of the heavy timber that comprised the building was left unadorned by carving or unrelieved by grotesque tracery; while every beam or lintel was terminated by a corbel head, perhaps that of a grinning satyr, which, with the towering roof, open spire, and covering of red tiles, contrasted not unpleasantly with the massive and sombre tone of the structure below.

Facing the cathedral stood a double-gabled house of a more pretentious appearance than its neighbours, from the greater quantity of carving that ornamented the wooden mullions of the windows and adorned the door-posts of the low-arched entrance, denoting the building to belong to some wealthy inhabitant or official of the town.

The house was the abode of Carl Underwaldent, the burghgrave or mayor, who on the present occasion was standing with some friends at the casement looking out inquisitively on the busy street in front. The period at which our story opens is mid-winter—that is, about the 20th of January 1740—a time of the year when the most intense frost prevails, not only here, but over the whole of Norway and the adjacent countries. For nearly six weeks at this epoch, the sun never rises above the horizon; and the only light during the brief day, is a faint glimmering that lasts for barely two hours, caused by the reflection of the

sun's rays on the snows of the mountain-tops, which, being again reflected upon the plains, affords that dubious light which constitutes day. As soon as this light disappears, the heavens are illumined by the aurora borealis, which, with the exception of the two hours at mid-day, is always present during winter in the Norwegian skies, affording a light more steady and perfect than the dim substitute that rules at noon.

The rivers, from the first setting in of the frost, are locked in sheets of ice, while the fiords into which they flow, like all the harbours on the western coast, owing to the warm sea-breezes, are, with rare exceptions, always open, so that the inhabitants of the coast have a free traffic with such winter commodities as are brought down by the mountaineers during the frost, by means of their sledges, when the rivers can no longer float their rafts. The mountainous range that, towering to a height of from 1000 to 2000 feet, encompasses the little burg of Lerwig, and forms part of that alpine chain that stretches through the whole extent of Norway, was, from pinnacle to base, covered for several yards deep with snow, which in the valleys and rifts lay to the depth of fifty fathoms. Along the plain, and spreading over the uneven streets of the grim old town, the snow lay compact as iron, from the friction of the sledges, that, loaded with merchandise or filled with chattering groups, were passing in rapid succession to and fro, the jingling of their horses' copper-bells keeping up a perpetual chime to their rapid and merry progress; while mountaineers and villagers in heelless boots or long arching skates, and every variety of costume, mingled with the inhabitants, and gave a singular animation to the wintery noon.

The room into which we beg the reader to follow us was large, and extended the whole length of the house; the walls were lined from ceiling to floor with scantlings of pine, and so finely polished that they shone like dark mirrors. The floor, composed of the same material, was covered with a coarse carpet of Finnish matting; a few heavy settles stood against the walls; while an arm-chair, stuffed with Lapland grass, was placed near the stove, and presented a most luxurious seat, being, from the warmth and nature of the grass or hay, a perfect nest of downy softness. About a dozen stools of all sizes were ranged about a table, or rather board, supported on trestles and covered with a sheet of huckaback, engrossing the whole middle of the apartment. To a series of brass nails round the walls hung pewter platters, iron and horn spoons, trenchers, and such implements of domestic use as were to be seen in a remote Norway household, and went far to bespeak the refinement of

the owner a century ago. The skeleton of a walrus—the bones as black as the beams from which it hung—afforded support to a set of iron lamps or cruces, that cast their light, when burning, directly on the table beneath, while the cavity of the thorax formed a receptacle for tobacco-pouches and sundry such articles. A round piece of bread like a Scotch bannock, hung by a hank of blue silk on the polished wall, and from a label duly engrossed, set forth that it was baked by 'Margarita, the frau of Carl Underwaldent, on the baptism of their first child, Gertruda, on the 17th day of January 1721.'*

A flight of steps at the extremity of the room led to the sleeping apartments, while, at the opposite side, a door opened on the hall and domestic offices; an elk's head and antlers over the entrance completed the appurtenances of the room, with one exception—the stove, which, placed between the two doors at the end of the apartment, projected about six feet forward. The stoves of the north are everywhere applied to the same purposes—they heat the house, bake, boil, and roast; and among the poorer classes, their flat tops invariably form a bed.

'The sun has set, Christopher, and taken his last kiss of purple Luhea, who is now as white as Hecla's night-cap,' exclaimed Carl Underwaldent, a broad-faced, jovial-looking man, as he turned his good-humoured countenance from the window and addressed a tall muscular youth, who, seated beside his young wife—a handsome girl of nineteen—was adjusting a shaggy bear's skin over the back of the hard seat, so as to protect her from the rough unpadded settle. 'You'll have a prime night for your travel, Chris,' he continued, kissing the approving lips of his blushing bride, joined his father-in-law at the casement. 'There's a sky for you!' he went on, pointing to the firmament with a feeling of exultation. 'Talk of your sun all day, and your moon all night—ah, bosh!' he added contemptuously. 'I wouldn't give a dried ling or a cod's sound for such; boo! There, you have all the colours of the rainbow. See! how they shoot like jets of purple and orange flame! It's a good augury, lad, and sent to light you homewards. There's a dart of blue, now, might shame the brightest amethyst!' And, in his enthusiasm, Carl slapped his listener's shoulder, to rouse him to a keener sense of the beauties of the aurora borealis, as, the moment the sun faded from the tops of the mountains, it began shooting its dazzling streamers over the sky—at first, in darts and leaping coruscations, that, bounding here and there in puffs of coloured light, seemed to break the whole face of heaven into dimples; then converging over the Polar Star, spread out their belts of luminous colour like a vast fan, and waving in stately undulations, looking like Juno's bird majestically walking the heavens; again, with erratic bounds, streaking the vault with separate rainbows, that, blending into one whole of mingled colours, seemed to carpet the entire sky with interlacing gold and purple, till, with a leap and flash like lightning, the whole vanished, leaving the expanse a leaden darkness. 'You don't get such lights as those in Sweden, Chris,' resumed Carl, in a triumphant tone, to his son-in-law. 'Now, having had their frolic, they'll come out soberly. There! I told you so.' And, as he spoke, a bright trembling blush of the most exquisite rose began to gradually intensify round the north pole, till a deep belt of orange skirted the northern half of the firmament, when, like darts from a bow, it shot out a thousand pencils of colour, the whole pouring down a toned and

softened light, sufficiently clear for the minutest office of daily life.

'It will be a famous evening,' replied Christopher. 'With the air so light, we shall reach the second six on the Lulians by midnight; and by starting early descend the Tornea by breakfast; after that, we can easily cross the plain to Gora in time for dinner. But who are those people who seem older than Gustav Adolphus, or even Vasa himself, so out of all memory, is the shape of their garments?' he inquired, pointing to several passengers, who moved on foot or in sleighs along the street.

'Here's Herr Peterhoff, he will tell thee the meaning of these matters,' replied his father-in-law, who readily availed himself of the opportunity to pass to another explanation demanded of himself.

'Why, Christopher,' began Herr Peterhoff, turning to his young friend, 'we Norwegians are very primitive in our habits, and like to remain as our fathers left us; and it is only in the towns that any change takes place at all, for in the mountains, things remain stock still; and each parish is known by its costume and some of the dresses have come down unaltered in fashion or material for several hundred years. The *stirle* (farmer or peasant) with his breeches and stockings all of one piece, and his loose jerkin or *waddel* and braided waistcoat, comes from the Salm Fiord; that Herdanger beside him, as you see, wears all black, with a bordering of red; the man in black and yellow is from Sogneford: so we know by his colours where the *stirle* comes from; but as every Norwegian is his own smith and carpenter, each man has got his axe, saw, and gimblet hanging in a chain by his side.'

'Thank you,' cried Christopher, in return for the explanation. 'I have only one more question, which as I'm a Swede, you will excuse my asking. Why have so many men letters chalked on their backs? Is it some trick of the boys, or do your people mark slates of each other's coats to cast their accounts on, and he pointed to several persons hurrying along, with the utmost circumspection avoided the least contact, as with bent shoulders, and their coats on the stretch, they hastened on their several destinations.'

'Ha! ha!' shouted his father Carl, in boisterous merriment. 'Now, by St Nicholas, the patron of salt-fish, thou hast made a great mistake, son Carl. Trick, quotha! A slate; no, no!' and he laughed again at the conceit of his son-in-law. 'Tell me, Frantz; tell him, neighbour,' and referring the explanation to one of his friends, he indulged in an involuntary chuckle at his son's remark.

'Why, friend Christopher,' observed the person addressed, 'our *stirle* farmers are better skilled at saw and adze than at the horn-book; so, when they bring down their deals in exchange for goods for the frau's housekeeping, the store-keeper chalks on their backs so many *lippards* of rosin, or so many lengths of deal; and as that is their only voucher for the delivery, they are careful not to get it rubbed out on their way to the pay-office, where all they have to do is to present their back to the clerk, who runs up the figures, pays down the thalers, and brushes out the reckoning. But, neighbour,' he added, turning to Carl, and smiling with considerable gusto at the aroma that issued from the stove, 'I smell the odour of roast-meats, and think the good frau has gotten dinner waiting in the oven; and it is a sin to do meat a shade too much, when the appetite is ready, and the time come for eating.'

'You are right, Frantz; so now, wife, set out the table at once, for I've a hunger on me as sharp as an east wind. Help yourselves, neighbours, and welcome to all!' So saying, Carl turned, and taking from the wall his platter, knife, and spoon, invited his guests to help themselves in the same manner, an invitation that required no second urging. In the meantime, the

* The Norwegian housewives are justly proud of their bread-making; they bake but seldom, and their bread will generally keep good a year. It is a common custom to bake bread at the christening of their first child, and preserve it for the feast given on the coming of age or marriage of the child.

wife, a tall sour-looking matron, assisted by an aged friend, opened the stove, and began removing the several dishes, and placing them on the table; while Gertruda, Christopher's young wife, rose from her settle, and, aided by four or five companions and bridesmaids, proceeded to light the lamps, and place large quantities of dried stock-fish, and pieces of bread or bannocks, beside every guest, the stock-fish being universally eaten as bread with every meal. Having attended to these lighter duties of the table, the young females drew their stools up to the board, and awaited the onslaught by the men. But we must take the present opportunity to make the reader acquainted with the personal appearance of the bride. Like the Norwegians of both sexes, Gertruda was remarkably fair, and the pure whiteness of her complexion would have made her face insipid but for the bright sunny blue of her large clear eyes, which, relieved by long dark lashes, gave it a peculiar vivacity and animation. Her figure was remarkably light and graceful. Over a *chemisette* as white as one of her native snow-drifts, she wore a close-fitting wadmel jacket of bright orange, which, fitting close to the arm, and showing the contour of the swelling bust, was laced in front from the neck to the waist, where it terminated in the form of a stomacher. A black girdle of polished leather, embossed with plates of silver, and adorned with small silver bells, rings, and other ornaments of the same metal, served to confine and adorn her slender waist. A full-flowing skirt of blue wadmel, gathered in flat plaits over the hips, fell in graceful curves round her person, and reached to within a span of her small-pointed shoe. Her hair, of a sunny chestnut, was, after the fashion of young wives, gathered into bands, and confined round her well-formed head in braids, while a party-coloured kerchief placed archly on the back, and tied with an expanded knot, was, with the hair, profusely covered with rings, medals, coins, large silver spangles, and thin plates of silver and gold; so that, at every motion, the entire head-dress flashed and scintillated with a brilliancy perfectly dazzling. A long silver chain wound three or four times round the neck, with a small medallion suspended from its links, and resting on the bosom, with amber bracelets, where the sleeve of the chemisette terminated in a frill, completed her costume; and Gertruda, like most of her Norwegian countrywomen, carried on her girdle and head-dress the whole of her bridal fortune.

Attracted by the savoury smell from the stove, two young girls suddenly made their appearance through the doors, and came eagerly forward to take their places at the table; but no sooner was the cold admitted into the room by the entrance of the maids, than the air of the apartment was converted into a cloud of snow, which fell like a fine white powder, covering every person and article with a layer of hoarfrost. So common a circumstance, however, produced no effect on the hungry visitors, who fell vigorously on the first dish that presented itself—a kind of porridge made of oat and barley meal, in which salted salmon had been cooked, to give flavour to the mass. This was followed by roast ribs of beef, a brisket of mutton, a haunch of venison, grouse, a stuffed hare, and a large dish of reindeer forage. For the first quarter of an hour, all were busy with their teeth and fingers to think of eating; but after the edge of their appetites was a little dulled, and the party began to eat more leisurely, Carl exclaimed: 'Try these reindeer tongues; they are of the real sort; I had them, with half a pound, from Tueta Ladrone himself, when he last came to the village. Nay, you needn't blush, Gertruda,' he said, observing the almost frightened look of his wife as she heard the name of the individual in question—the poor fellow meant no harm in asking

for thy hand, although, even if I hadn't set my heart on Chris here—as thou didst too—he was quite out of the question.'

'Who's that?' demanded Frantz, with his mouth distended with stock-fish and roast brisket. 'Eh! what? Tueta, the Lap!—ah, bosh!' and swallowing hastily his mouthful, he turned his head, and, with a gesture of contempt, testified his disgust at the name of a Laplander by spitting on the floor.

'Had a Lap the insolence to propose for my Gertruda?' inquired Christopher, looking up from the rib of beef he was attacking with his teeth. 'I sicken at the name of a Lap.'

'Well, well, he meant no harm,' resumed the father apologetically; 'and I was obliged to speak him fair, for Tueta is powerful with his charms and incantations. Bless you! he's quite a magician, and has a black cat that, for instinct and devilry, I think is the very fiend himself. I wouldn't say it before him, but I hate a Lap; and that's the reason I've arranged for you to set out to-night, only three days after your wedding; because Tueta's gone home by the fiords instead of over the Tornea, where you might have met him; and his frown would put a blight on the best man living. Then, again, he's as dangerous to handle as a *goupe*.* Oh, he can do no end of mischief!'

'Have you got a cat, father Carl?' demanded Christopher, looking inquisitively at the top of the stove.

'Surely, lad—surely. Bumpo! Where is he?'

'Well, I suppose he is up there, on the roof of the stove,' he replied, 'for a pair of red eyes have been fixed on me for some time. There!' and he pointed to the servant's bed on the top of the stove.

'Oh, very likely; he's fond of a warm berth. Perhaps he's hungry. Bumpo!'

'I'll give him a bone, then,' cried the young man, taking up the heavy rib he had so carefully polished, and flung it with so true an aim, that it struck, as the company judged by the sound, the animal's head.

'By St Nicholas, that was a blow!' cried Carl sympathetically.

'It's made him shut up his eyes, at anyrate. I never saw such eyes in a cat's head before. But what manner of man is this Tueta?' inquired Christopher abruptly.

'Oh, he's well enough for a Lap,' replied his father; 'though he's not altogether a Lap, but a kind of cross: his father was a Dane, and so Tueta is rather good-looking, and as strong as an ox. Why, lad, his hat's covered with tin scales—one for every bear he has killed, according to the custom of the Laps. Then he plays on the flute beautifully; but notwithstanding, like all his people, he's powerful ignorant.'

'Poor wretch!' ejaculated Christopher, in a tone of pitying scorn.

'Poor!' exclaimed his father in astonishment, mistaking the cause of his son's pity: 'Tueta poor! A man with a summer *gamme* on the Waranger Fiord, and a winter one on the Luhea. Poor! A man who owns a thousand reindeer—has a cap of black fox, and a cloak of martens' skins—can eat deer's flesh every day of the year—has a rifle, a copper kettle, two iron spoons and a fork. Poor! Why, lad, where be thy senses!'

'Rich or poor, he's but a benighted heathen,' exclaimed the hostess; 'for who ever believed that a Lap had a soul! If he had one at his birth, his wicked mother was sure to sell it to the Evil One, with his first teeth. But if Chris and Gertruda mean to cross the Seggevara to-night,' continued she, 'instead of sitting here talking of Lapland heathens,

* The *goupe*, or lynx, when attacked, throws itself on its back, and, with its powerful claws, frequently rips up the dogs that hunt it.

you'd better yoke the horse to the *pulta*, and get the skins ready for travelling.' And the frau rose hastily. Her suggestion, or rather command, was at once carried out, for the wife's word was law in the house, however much Herr Carl might delude himself with the belief that he was its master.

Quitting the table accordingly, the female part of the company ascended to the bedrooms, to dress the young wife for her first departure from home, while the men gathered round Christopher, as he equipped himself for his long journey through the severe cold of a mountain region; and he was just accoutered and ready as the *pulta*, or travelling-sledge, and horse came up to the door.

Gertruda had just entered, carefully wrapped in her furs, and holding her vizard of white gauze in her hand, and was giving and taking the farewell kiss, when a *pulta*, drawn by a Daniah horse, with its chime of merry bells, dashed past the window, and before the driver could be seen distinctly, had left the street, and was lost in the shadow of the mountains.

Cheered by knowing that another traveller was on the same path, Christopher hastened his preparations, and the weeping Gertruda was led out by her husband, and placed among the pile of cushions and furs. Passing her arms through the straps at the back of the sledge, to keep her stationary, Christopher carefully adjusted her mask, and drawing the skins over her person, fixed her securely in the low carriage; then looking to the priming of his rifle, he took his seat in the *pulta*, and waving his hand to the group at the door, gave his horse the rein. With an impatient bound, the animal dashed into the street, and with long strides, tore over the polished snow with a speed that soon left the town and its inhabitants far behind; while the velocity of their motion, and the purple fires and golden lights that cast their scintillating glory over their path, so exhilarated the spirits of the travellers, that their enjoyment rose to a kind of ecstasy.

Two hours of rapid travelling brought them to their first halting-place, whence, after an hour's rest and refreshment, the pair again set forward, and in two hours more reached their destination for the night—a stove, situated in a chasm of the loftiest pinnacle of the chain up whose side they had thus far travelled.* The view from this point of the Lulian Alps was truly magnificent. Far down at their feet, lay the narrow indented shores of Norway, while beyond, as far as the eye could reach, stretched the vast Atlantic; northward, the Loffoden Isles, and the stormy horrors of the North Cape; while on the east, the level plains of Sweden, and the barren steppes of Lapland, filled up the picture.

Taking advantage of the early morning, the pair performed the descent of Lulea, and halted at a small inn on the banks of Lulea Treiste. Christopher here discovered that a sprain his horse had sustained was likely to detain him some time, as not another was to be obtained, and his own was unfit to journey further: this, when a few hours' drive would have carried them to Gora, was most vexatious; for there was no knowing how long they might be delayed, or to what annoyances subjected. Finding his horse grew worse rather than better, towards evening, Christopher threw his rifle over his shoulder, and leaving Gertruda in charge of the master of the inn, set off to a game of Laplanders, to hire one or two reindeer to take their sledge home. As Gertruda sat reflecting on the discomforts that surrounded her, and contrasting the repulsive room with the cheerful abode she would

make of her new home for her beloved Christopher, and picturing her future with all the colouring of hope and affection, her ear became conscious of a low breathing music that gradually stole into the apartment, and rising with measured cadence, filled the air with tones of such plaintive harmony, that the young wife bent her head with curiosity and delight to catch every vibration of the touching melody. When the strain was over, and Gertruda scarcely yet recovered from her wonder, she was roused from her reverie by the gladly recognised clack, click, clack, the noise made by the knees of the reindeer when in motion, and the jingling of the *pulta*-bells appraising her of the success of her husband's mission.

'I am to help you into the *pulta*, while Herr Christopher pays the Lap for the use of his deer,' observed the master of the inn, as he entered and announced the sledge. The host having assisted to pass her arms through the shoulder-straps, enclosed her hands in a pair of long gloves, closed the apron, and saying he would call her husband, retired. The man who stood by the deer having whispered in their ear the place of their destination—a custom a Lap never omits before starting—stepped backwards with the reins till on a level with the sledge, when, bounding into the vehicle, the reindeer dashed forward like the wind, the mysterious driver standing erect and motionless as a pine, while the host leaped upon the runners, and held firmly to the back of the *pulta*.

The whole proceeding was so quick, that Gertruda was unconscious of the treachery practised till already in motion. As soon, however, as she could comprehend her situation, she shrieked with terror, and called upon her husband for aid and rescue. Christopher, who was returning from an unsuccessful conference with the Lap, at that moment descended into the plain, and hearing the voice of his wife, sprang forward to ascertain the meaning of her cries, as the sledge came flying onwards. Without checking the speed of his deer, the motionless driver drew a missile from his breast, and hurled it at the head of the intruder; but Christopher, quick of eye, caught the projectile in his hand. One glance told him with whom he had to deal, and what to expect. It was the bone he had thrown at the supposed cat! Dashing it to the ground, he instantly brought his piece to bear on the erect form of the fugitive, and fired; but at that moment the *pulta* dipped into one of the hollows, and threw the back of the innkeeper into the line of aim, and the shot entering his spine, he threw up his arms, and, with a loud shriek, fell heavily on the snow; but, indifferent to the wail of the dying wretch, the impassive driver kept on his course, and in a few moments was lost in the haze that swept like a dark scud over the dreary region. Christopher saw that pursuit was hopeless, and turned with a vindictive heart to retrace his footsteps, brooding on some swift and terrible revenge. Suddenly, the silence of the night was broken by a cry, that rang through the frosty air with a wail as shrill and wild, that Christopher paused in suspense to hear a repetition of the sound. After some moments of intense listening, the growl and snarl of a gorging wolf came down like a deep breathing through the stillness. With a smile of grim pleasure, he reloaded his rifle, and, throwing it over his arm, stalked stealthily back to the inn.

When Gertruda saw her husband start so unexpectedly on their path, her first intention was to throw herself from the *pulta*; but she soon discovered that the accomplice, when he drew on the large gloves, had artfully united her wrists, so that she was a complete prisoner, pinioned and handcuffed.

That Tueta was the author of this outrage, she had no doubt; and when she could muster courage to look on the motionless driver before her, she had no hesitation in believing that he and the dreaded Lap were the

* Stove, a building erected and maintained at the public expense for the comfort of travellers among the mountains in Norway, where, free of all charge, large stoves are kept burning day and night, for the accommodation of all who journey in such elevated regions.

me. His well-built, muscular frame—for he differed most characteristics from the people of his nation—boded of itself a strong confirmation of her belief; hile none but Tueta could have preserved such a untless attitude, his form rising like a mast from e carriage, and swaying with the flying pulta. gain, had other circumstances left any doubt, a nce at his dress would have dispelled it. A tall p, of the priceless black fox, rose straight from his rehead; while the tail of a snow-white ermine, its tremity tipped with black, hung from the crown his shoulders like a drooping feather. The robe at encompassed his person was made of many hun- ed skins of the black marten, and descended in regal splitude from the neck to the heels, while a chain of ver amulets, rings, and medals, crossed, like a collar state, his furry shoulders. As regarded his features, rtruda was yet in ignorance; for though Tueta d seen her frequently, she had never herself met m, and it was only through her mother that she d heard of his proposal for her hand. It was there not without a certain curiosity that, despite the nger of her position, she watched for some motion her guide that should enable her to see his counte- nce; but though the north wind came howling over e bleak steppes, and the flying reindeer dashed up e snow like spray, and the swells and dips in the rface of the plain made the carriage rise and fall e a vessel in a storm, the driver never for a oment removed his unprotected glance from the ack outline of hills that rose like a wall in the stance, and towards which the reindeer stretched ir utmost speed. As if a part of the inert vehicle, continued to stand erect; now over the plain and even steppes, and anon up the mountain-track and wn the gloomy glens and rifts. At length, dashing to a sheltered ravine, and skirting the bank of a zen lake, whose ice, blue as steel, contrasted nly with the universal white that covered hill d vale, the deer suddenly halted before a series of gammes or low huts—the winter encampment of eta Ladrone the Lap.

The driver had scarcely leaped to the ground, when, th a cry and a howl, a huge black cat bounded on e shoulders, and began caressing him in a manner ferocious as playful. During this ceremony, three four Laps hurried to the pulta, and, unfastening r gloves, carried Gertruda at once into the largest mme; where, such was the effect of the sudden heat d unwholesome atmosphere of the place, she would ve fainted but for the assistance of several women, ho, by removing her furs, and giving her a draught reindeer milk and brandy, succeeded in relieving r from the feeling of suffocation caused by the oven- e heat of the gamme.

As soon as she was sufficiently recovered, the women eed before her hot milk, boiled salmon, and dried er's flesh, which, as she had been many hours without od, and exposed to the rigour of the weather, she e absolutely in need of. From the women, she uld learn nothing further than that Tueta himself d been her conductor—that this was only one of his rms—that the great gamme with his mother and here, was a day's journey further to the east, and at the hut she was in was the women's gamme. ailing to elicit any further intelligence, and expressing r weariness, they brought her a mattress of eider athers, and a pillow of Lapland grass; and spreading y the fire, Gertruda laid herself down on the luxu- us bed, and, despite her anxieties, closed her eyes, d was almost instantly asleep: while the women, ith their knees up to their chins, and faces resting on eir hands, kept watch round the fire, gazing with eir small beared eyes into the glowing embers, and e subdued whispers, recounting to each other tales f incantation and witchcraft. The strong odour of

cooked meat, and the voices of the women, raised in dispute, awoke Gertruda from a sleep that had extended over the lapse of two meals, so profound had been her slumbers. The sudden jangling of sledge-bells apprised her that something of import- ance had occurred, and while she was yet pondering upon its nature, the women began suddenly to attire her precisely as she had been dressed when she arrived. The same men immediately after entered, and taking her in their arms, placed her, pinioned as before, in a pulta, to which three reindeer were already attached, while Tueta, as before, stood at their head. Having given the usual muttered notice to his team, the Lap sprang into the carriage, and the animals bounded forward, leaving the huts, lake, and valley behind, as the buoyant sledge, holding onwards, rapidly crested the mountains that encompassed them. In about two hours, they descended the last hill, and entered on the vast level that, stretching from the Tornea River to the White Sea, extends for three hundred leagues its desolate waste of snow, without landmark or track.

Though their course was still rapid, it wanted that velocity which had heretofore characterised their progress, for the snow was so deep on the plain, that the runners of the pulta dashed it up like billows, while the sinking sledge was frequently some feet below the level of the channel through which they ploughed their impetuous way. After proceeding some leagues over this ocean of snow, Tueta, grasping the rifle that lay in front of the pulta, and pointing with it to the dark and hazy distance, turned his face for the first time to Gertruda, and said: 'He is a good husband, and will risk much for his wife. I will not kill him, but he shall have no advantage;' and dropping the muzzle of his rifle till it rested on the bottom of the carriage, he used the butt as a crutch to lean on.

'I do not comprehend,' replied Gertruda, in surprise at the abruptness of his words, and almost quailing before the piercing glance he bent with a fascinating power on her countenance. Shaking off some of the influence inspired by the presence of the dreaded man on whom she looked for the first time, she gazed on his features with a feeling of wonder and surprise. His eyes, of an intense black, had all the fire and tenderness of a southern clime, and though of the same colour, were unlike those of his people, in being full and open—a peculiarity that, with his broad fore- head, he derived from his Danish father; at the same time, his high cheek-bones and projecting jaw were equally indicative of his Lapland origin, though the repulsive character of the latter feature was greatly modified by a full moustache, and a beard that flowed majestically on his breast. But the sallow complexion and small hands and feet were purely Lap, though the straight limbs and perfect symmetry of form were derived from his father. On the whole, Tueta was what might be justly called a handsome man.

'I mean,' replied the Lap, 'that your husband follows us. But we will strive on equal terms. Do you understand?—your husband is there!' and he turned his glance to the south. Gertruda directed her gaze in the direction indicated, and after a long scrutiny of the scud that swept over the horizon, perceived what might have been mistaken for the hull of a ship, which, parallel with themselves, seemed stationary on the verge of the waste. At length she was enabled to make out a sledge and four reindeer through a break in the scud, as it was for a moment defined against the leaden sky beyond. The pleasure which Gertruda derived from the knowledge of her husband's presence, was quickly banished when she saw Tueta turn his deer in a course that would bring him directly across her husband's track, especially when she looked at the deadly weapon he held in readiness. These feelings were excited to the keenest terror when she observed

the other sledge put about, and the two vehicles rapidly converging. When within a few furlongs of each other, Tueta raised his rifle, and fired; at the same moment, the pulta again flew round, and the animals bounded like the wind upon their former course. Instantaneously with the discharge, the leading deer of the approaching sledge sprang into the air, and fell dead among its companions. To cut the harness, and throw out the lifeless deer, rearrange his team, and once more follow the pursuit, was but the work of a few seconds; and Gertruda had the satisfaction to know that her husband was unhurt and again in motion on their trail.

Familiar with all the bearings of the snowy desert, and confident of his route, Tueta never for a moment doubted his being able to baffle all pursuit. But he had to deal with a man every whit as resolute as himself; and what might have been a successful stratagem under other circumstances, lost all its effect when met by such energy as was exhibited by Christopher Steinhoff, who was personally as indifferent to danger as the witch-inspired Lap himself. Though the death of his deer somewhat delayed him, yet he was again upon the track, sooner than Tueta could have believed possible; with his rifle on his knees, he urged on the chase with the utmost speed of his untiring deer. But so uncertain was the drifting scud, that it became necessary for both men to keep as large a space between them as possible, till one or other could fire with advantage.

'Herr Christopher is swift,' observed Tueta to Gertruda, as his eye caught her husband's sledge looming through the haze; 'but it shall avail him nothing; I'—A flash of red flame leaped from the side of the dimly seen sledge as he spoke, and a bullet whirled in the air. With a deep frown, the Lap instantly reversed his rifle, and drew a cartridge from his pouch. 'He has unsheathed the knife; let him look to its edge,' he said vindictively, as he rammed home the charge. 'I would have spared him, but now he dies.'

'My husband!' exclaimed Gertruda in terror; 'spare him—spare him.'

'Hark!' he cried abruptly; 'the wolves bark over the dead deer; they will eat his flesh too, and the snow will bury his bones. Look!' and turning the direction of his deer, the pulta flew round, and held a course in the track of the sledge, which the next moment was seen bursting out of a dense scud, bearing down in full career, with such an impetus, that all Tueta's skill was needed to avoid a collision. They dashed past with a velocity that carried them again beyond the sight or sound of each other; but at the instant of recognition, and while in midway, both men levelled their rifles, and fired; and though Gertruda strove to discover whether her husband was hurt, such was the speed at which they flew, that the sledge was beyond her sight before she could form an opinion. Tueta was apparently unharmed, for he directly reloaded his piece, and stood silent and motionless, as the pulta dashed onward on its altered course.

At length, as if awaking from a dream, the Lap shook his head, and looked keenly round the horizon. Not discovering the object he sought, he put about the pulta, and the deer started in an opposite direction with redoubled speed. After many bends and unsuccessful tacks over the pathless snow, his practised eye at last discovered the sledge emerging from the scud. Tueta instantly raised his rifle, and taking deliberate aim at the approaching figure, fired. The next moment, the piece fell from his hands, and without a sigh, or the slightest indication of pain, the Lap dropped heavily over the front of the pulta, as his foremost deer, pierced by a ball from the sledge, fell dead, bringing the vehicle to a sudden halt. So swiftly

was the sledge borne over the ground, that it passed the pulta some distance before Christopher could check its velocity, or bring his vehicle to the side of his prostrate enemy. To leap from the carriage and find his rescued wife in his arms, was the work of a moment. So unbounded was his joy, and so fervent Gertruda's thankfulness at her husband's safety, that for some time neither could speak; never till that moment, when their troubles were over, had the dangers they had escaped appeared so formidable.

He liberated his Gertruda's hands, and pressed her to his heart, as he carried her from the pulta, and placed her in his own sledge; and he thought as he kissed her lips, and received her approving smiles and thanks, that she had never looked so beautiful, nor been so dear to him, as then. Christopher next approached his prostrate rival, and searched minutely for the wound which he must have received more than half an hour previous, for he had fallen before the last shot that struck the deer was fired. A little blood that had oozed from the right side was the only injury his examination could discover; and believing he had only fainted, Christopher drew the dead deer into the pulta, and making it serve as a pillow to the wounded man, laid him along the carriage, and covered him up with furs. Trusting to the sagacity of the animals to take their master home, he clasped his hands, and starting the deer, saw them dash off in an easterly direction with their accustomed speed. Having watched their progress till they were lost in the haze of the horizon, he took his place by his beloved wife in the sledge, and directing his course south, was soon flying—like a ship before the wind—upon his homeward journey.

Obtaining a relay from a gamme near Kangia, in six hours more they were dashing through the solitary streets of Gora, and at length drew up before the door of Herr Steinhoff's house.

Leaping out of the sledge, Christopher caught Gertruda lovingly in his arms, and, as if fearful of losing his coveted prize, carried her into the house, placing her in a warm settle near the stove, he knelt by her side, and passing his arm affectionately round her waist, with an endearing kiss welcomed her to his Swedish home.

COMETS.

We were leaving Byculla Church, after evening service, one Sunday in the spring of 1843, when the first comet we ever saw was presented to our eyes. Its whereabouts was announced to us in a very startling manner by the cry of a child who was with us, 'Mamma! there is a fiery sword in the heavens!'

Bending from beneath the carriage-hood in astonishment, we beheld the most glorious apparition our eyes had ever dwelt on—a comet, and such a comet! a small nucleus, bright and clear, and a tail, which, scimitar-shaped, swept over half the heavens, and dipped its slender point in the western sky. Even now we can see by the eye of memory the white radiance of that delicate splendour. It was of transparent light—one could see through it the stars of Orion quivering as through a milky haze. The sight of this glorious stranger was a surprise to the European population of Bombay; the natives—at least to whom we spoke—expected it. When we asked of Parsee Arjeeesha, what he thought of it, he replied, 'Much fine comet, Ma'am Sahib. People know it is coming. Great empire going to fall.'

The superstition put us in mind of the tales of Europe in the middle ages, with allusions to the pages of the old dramatists are to be found.

activity,' says Owen Glendower, 'the front of heaven as full of fiery shapes.' And again, in *Julius Cæsar*, Shakespeare makes Calphurnia, with the feeling of his people as well as of hers, say :

When beggars die, there are no comets seen—
The heavens themselves blaze forth the death of princes.

How did these unlearned Asiatics forebode the coming of the comet, of which European science was ignorant? One cannot tell; but one thing is certain, the Chinese have ever had a peculiar sympathy with these long-tailed strangers; they traced the starry path of each of those visible to them through every separate constellation, more than five hundred years before the Christian era. They call the tail of a comet a 'brush;' and were the first to observe and record a comet which was not known in Europe till the sixteenth century—that is, that the tail is always turned away from the sun, so that their line of prolongation passes through its centre. It might, therefore, have been from Chinese science that the Parsee and Hindoo were led to expect *my* comet. How beautiful it was, and how we used to sit and watch it from the house-top at those delicious starry nights! We were told by some officers who came just then from England, that here it looked only like a cloudy star, and the eye had to seek for it before it could be perceived. We were sorry that the eyes most dear to us could not rest in its glorious beauty also; but stranger as it was, we were quite to love it and look for it, and were pained when its place knew it no more, and it had vanished into space. Comets go away for such long periods of time, generally, that we can scarcely ever hope to meet them again. We have heard since that our English visitor was even more resplendent in North America, for it was seen in daylight, in dazzling sunshine, at New Bedford, Massachusetts, on the 28th of February, the distance of the very dense nucleus from the sun's light admitting of being measured with such exactness. We ourselves have traced it as a heavy cloud upon the eastern sky, before the daylight had quite faded; but the sun of India allows of no rival in its noonday dominion.

We have been led into this reminiscence of the comet of 1843, by hearing of the strange commotion and apprehension which the expected visitor of 1857 is creating in some parts of Europe, and even in England. A friend wrote to us the other day, that the shoemakers of the county town had left off work, expecting, like others, that the 13th of June was to see the end of the world; and being determined, they said, to enjoy the last month of their existence! Now, though we cannot assuredly say that combustion by a comet is *impossible*—for the orbit of Biela's comet intersects that of the earth, and might, therefore, as Humboldt observes, be productive of danger—still, the chances are so greatly *against* it, that we felt convinced ourselves we should experience no evil consequences from the coming visitor. As, however, everything mysterious or indistinct to our mind has a certain awfulness and shadow of fear about it, we purpose to lay before the general reader some facts concerning these fiery denizens of the sky, which may render them more familiar objects to our imaginations: not that we know a great deal of the comets; we are not at all, not even the wisest of our astronomers, on such intimate terms with them as we

are with our next-door neighbours the planets, or even with the aristocracy of fixed stars beyond, but we do know something from actual and recent research and experiment, and that we mean to tell.

And first—rare visitors as the comets are to us, they are, nevertheless, a very large tribe in themselves. Kepler tells us that there are more comets in the regions of space than fishes in the depths of the ocean. They have not, as the stars, a striking family-likeness, but vary in appearance so much, that a description of one of them could only be applied with caution to another. 'The faintest telescopic comets are generally devoid of visible tails, and resemble Herschel's nebulous stars.' This is the most simple type; but we cannot be sure, therefore, that these are infantine specimens of the perfect meteor, as they may just as probably be the remains of older cosmical bodies exhausted by exhalation. In the larger comets, we can distinguish the head or nucleus, and the single or even double tail. The head presents no definite outline, except in a few rare cases, when it appears as a star of the first or second magnitude, as did that of our personal friend of 1843. Doubtless, this indicates, in the case of these individuals, a greater thickness of mass, capable of reflecting light in greater intensity. The tails are sometimes single, sometimes double; frequently their branches are of different lengths—in one instance, in 1744, a comet appeared with a *six*-branched tail, the whole forming an angle of 60 degrees. The tails are straight or curved, and sometimes appear even like a flame in motion, and are of all sizes. The tail of the one seen in 1618 measured 104 degrees!

The mass of a comet is smaller than that of any other cosmical body, indeed insignificant in comparison, though never yet in any case precisely ascertained; but they occupy much more space, their tails extending over many millions of miles. 'The cone of luminous vapour,' says Humboldt, 'which radiates from a comet, has been found in some cases—as in 1680 and 1811—to equal the length of the earth's distance from the sun, forming a line that intersects the orbits both of Venus and Mercury. It is even probable that the vapour of the tails of comets mingled with our atmosphere in the years 1819 and 1823.' Can any of our readers remember if those years were especially hot? for we have some small misgiving as to great heat this approaching summer, in consequence of the expected bright one.

The variations in form which occur in comets are many and frequent. The comet seen by Hensius at St Petersburg in 1744, had a well-defined tuft of rays emanating from that part of the nucleus or head which was turned towards the sun; and these, bending backwards, formed a part of the tail. The nucleus of Halley's comet, 1835, resembled a burning rocket, the end of which was turned sidewise by the force of the wind. The rays assumed different forms on successive nights, as they were watched by M. Arago and Humboldt from the Paris Observatory. The comet of 1823 had two tails in opposite directions, one turned towards the sun, the other from it, forming with each other an angle of 160 degrees.

With regard to the light of comets—an important question when the burning of the earth is dreaded from it—the experiments of M. Arago with an instrument called the polariscope, have informed us that it is *principally* reflected. 'On the 3d of July 1819,' says Humboldt, 'Arago made the first attempt to analyse the light of comets by polarisation, on the evening of the sudden appearance of the great comet. I was present

at the Paris Observatory, and was fully convinced, as were also Matthieu and the late Bonvard, of the dissimilarity in the intensity of the light seen in the polariscope, when the instrument received cometary light. When it received light from Capella, which was near the comet, and at an equal altitude, the images were of equal intensity. On the reappearance of Halley's comet in 1835, the instrument was altered so as to give, according to Arago's chromatic polarisation, two images of complementary colours—green and red. . . . The comet shewed polarised, and therefore reflected light, whilst the fixed star Capella shone forth a *self-luminous sun*. It does not follow that a comet has no light of its own; the reflected may exist with the independent light, as it is supposed may be the case even with the planets; but every experiment appears to prove that these snowy, and, when seen by daylight, cloudlike strangers, are nothing more than mirrors of the sun's brightness, and, as such, very little likely to set fire to the earth.

Three of the known comets are called planetary, because they do not pass beyond the limits of the orbits described by the principal planets. These are Encke's, Biela's, and Haye's. Biela's comet—which appears every six years—intersects the earth's path in its course, and is the only one which does so; but when this passage occurred in 1832, it required a full month before the earth could reach the point of intersection. And even if so unlikely an event as a collision had occurred, the planet would probably have suffered little, if at all; the poor comet seems more likely to have been the victim of the shock. This comet also intersects Encke's, and both revolve at short periods. Littrow* has, therefore, justly observed, that 'amid the many perturbations experienced by such small bodies from the attraction of the larger planets, there is a *possibility*—supposing a meeting of these planets to occur in October—that we earth-dwellers may witness the wonderful spectacle of an encounter between the two, and possibly of their amalgamation or destruction.' One feels inclined to say with Cowper, in *John Gilpin*: 'May I be there to see!'

The host of other comets roll far away from our system into the regions of space, appearing only at long intervals of time, and in no dangerous proximity to our planet. The beautiful comet of 1811 requires a period of 3065 years to complete its appointed circuit—the colossal one of 1680 as much as 8800 years, according to Encke's calculation.

In closing this brief notice of comets in general, we cannot forbear to quote Humboldt's concluding remarks concerning them:

'Since scientific knowledge,' he says, 'has been more extensively diffused through wider circles of social life, apprehensions of the possible evils threatened by comets have acquired more weight, as their direction has become more definite. The certainty that there are within the known planetary orbits, comets which revisit our regions of space at short intervals—that great disturbances have been produced by Jupiter and Saturn in their orbits, by which such as were apparently harmless have been converted into dangerous bodies—the intersection of the earth's orbit by Biela's comet—the *cosmical vapour* which, acting as a resisting and impeding medium, tends to contract all orbits—the individual difference of comets, &c., &c. . . . are all considerations more than equivalent both as to number and variety, to the vague fears entertained by early ages of the general conflagration of the world by flaming swords and stars with fiery streaming hair. As the consolatory considerations which may be derived from calculating probabilities address themselves to reason and to meditative understanding only, and not to the imagination or to

a desponding condition of mind, modern science has been accused—and not entirely without reason—of not attempting to allay apprehensions which it has been the very means of exciting. It is an inherent attribute of the human mind to experience fear, and not hope or joy, at the aspect of that which is unexpected and extraordinary. The strange form of a large comet, its faint nebulous light, and its sudden appearance in the vault of heaven, have in all regions been almost invariably regarded by the people at large as some new and formidable agent, inimical to the existing state of things. The sudden occurrence and short duration of the phenomenon, lead to the belief of some equally rapid reflection of its agency in terrestrial matters, whose varied nature renders it easy to find events that may be regarded as the fulfilment of the evil foretold by the appearance of these mysterious cosmical bodies. In our own day, however, the public mind—in Germany—'has taken another and more cheerful, although singular turn, with regard to comets; and in the German vineyards of the beautiful valleys of the Rhine and Moselle, a belief has arisen ascribing to these once ill-omened bodies a beneficial influence on the ripening of the vine.'

We need only add, that the expected comet of 1857 is, we are told, the bright stranger that frightened Charles V. from his throne, and—'it's an ill comet that does nobody good!'—was supposed to be an attendant sign of the Reformation, then about to be established in England through the accession of Elizabeth.

THE ALDBURGH COACH.

ALDBURGH, to which there are now three daily trains in summer, and two in winter, was, about twenty years ago, provided with one stage-coach, carrying four insides and thirteen outsides, besides occasional interlopers. Of this vehicle I was a pretty frequent customer, for the sake of the angling which is to be enjoyed in perfection in the river flowing past Aldburgh. Imagination fondly turns back to those days, when, just returned from a thirteen years' exile in India, I was fain to make periodical visits to a scene of recreation familiarised to me in boyhood, where the pleasures of the rod are to be obtained in perfection. Yet, verily, must I confess that my occasional piscatory enjoyments were purchased at a rather dear rate in the incommodations connected with that coach, by which I used to be conveyed to the place of action.

The starting of the Aldburgh coach was always attended with more or less of excitement. Notwithstanding my practice of engaging a seat the day before, and taking care to be on the ground in good time, I never somehow could be quite sure that all would be right. Generally, on coming up and casting a hurried glance at the interior, I would find the whole space occupied by a number of placid-looking, but determined females, inclusive of one with a nursing-child. My repugnance to outside travelling would make me insist upon my rights; but it was no pleasant thing to see the nurse and her baby descend from the vehicle, casting on me a look of outraged humanity as she passed, and then to take my due place among the indignant sisterhood who remained, not without some apprehension that they would combine with the outsides to toss me in a blanket at the first halting-place. Meanwhile, the driver-cum-guard—for the two were united in one—would bustle about, tearing and swearing, along with a distracted and bareheaded clerk

* *Beobachtende Astron.* 1835. S. 274.

from the office, as they vainly endeavoured to reconcile a discrepancy between the numbers on the coach and the way-bill. In intervals of imprecation, the former official would come every minute to thrust parcels under my seat, obliging me to sit with my knees up to my mouth while he did so; or else would stuff packages into the pockets of the coach, till they amounted to the bulk of a couple of extra passengers, grievously encroaching upon the space assigned to the ladies and me.

When at length we had got every receptacle stuffed, and twenty extra things hung on, and all the insides and outsides fitted, and the three horses put into due order for starting by the assistance of porters and bystanders, off our vehicle rolled, or rather swung, along the crowded street. The fearful crowding on the top was shadowed to the insides on the walls of the houses we passed, and we saw our jeopardy in the countenances of the crowd which we left gazing after us. It usually happened that, before we had advanced two hundred yards, the driver stopped, descended, and, after casting a wistful look at the inside, as if he had not known that it was full, proceeded to make a new adjustment of the luggage on the top, in the hope of giving his vehicle a better centre of gravity. Then would be heard interchanges of civilities between him and certain Irish labourers whom he was disturbing in their seats, or possibly the scoldings of old women who considered themselves as disrespected, or clamours from my friend the nurse-maid, mingled with the screams of her infant charge, and the curses—not loud, but deep—of the old-bachelor gentleman, for his sins placed next her. On renewing our journey, a shoemaker's apprentice would get upon the steps behind, by way of quickening his progress to his work, and set himself to gaze with an alarmed and curious expression at my face, till I begin to think myself something not fit for this world. By and by, the outskirts of the town being reached, my young friend would drop with a farewell shout of defiance. The green fields now beginning to appear, I would turn to contemplate them through the window, but find I could get but the barest glimpses of them through a pair of hobnailed feet, hanging over from the roof. Rather than be reduced to a state of torpid endurance, I would then launch a remark on the long continuance of the east wind to my *vis-à-vis*, in the hope of leading to a conversation; but the curtness of the response would quickly settle that matter, and leave me no resource but to speculate in my own mind on the probable state of the river I was about to visit, and the amount of fish which I should consequently take.

Suddenly the coach stopped, and the driver, with an air of eager business, pushed into a public-house, where, by the favouring shift of a bit of curtain, I could see him in high confidence with the landlady, partaking leisurely of perhaps his second or third 'morning,' while the passengers sat in a state of patient and becoming solemnity. The reins were meanwhile intrusted to the hands of some stripling, who thought himself justified in playing the whip on the ribs of the skittish leader, which immediately would exhibit such vagaries as drew forth the screams of the old ladies. Our driver would come out, and, resuming his duty in no good-humour, revenge himself upon the three horses, and away we would go rushing at a furious pace down a slope terminating in a turn at

a narrow bridge, by far the most critical part of the journey. We pass without accident, and keeping on at the same pace, soon reach the end of the stage, where a sigh of relief breaks from my lady-companions. Their stiffness is now at an end, and I am consulted as to whether there was real danger in the piece of road we had passed. 'Well, ladies,' said I, 'I do not think there was *more* danger in it than one would encounter in a voyage to India.' Then would follow some comments on the evils of drink, which, being of a nature more trite than pointed, I need not repeat.

Willie—for so our charioteer was named—left all the business of changing the horses to a couple of ragged stable-boys. Taking a parcel from one of the pockets of the coach, and surveying it with a knowing look, he would dive into the inn, usually followed by one or two of the outsiders, who looked, or tried to look, as if they felt a little chilly. Then would the frequent passing to and fro of a dirty serving-girl reveal to us remaining passengers what was going on in the house. If we tired of watching these proceedings, we could turn our observation on the couple of hacks now attached to the coach—for the third was here dispensed with—and recall the apt description of Shakspeare:

The poor jades

Lob down their heads, dropping the hides and hips,
The gum down-roping from their pale dead eyes;
And in their pale dull mouths the gimball bit
Lies foul with chewed grass, still and motionless.

A loud remonstrance from the passengers was necessary to recall the roisterers, when out would come the driver, blown with insolence and whisky, to resume his seat, and revenge himself by a couple of miles of as furious driving as the condition of his cattle admitted of.

In the course of our journey—granting that we overcame the sense of danger—other disagreeables were in store for us. We would feel a trickling sensation about the neck, and discover it to arise from the dripping of wine, beer, or other fluid, from cases of bottles carried on the roof—some one or two of which were sure to be broken in consequence of the driver's rough way of disposing of them. Sometimes we were visited by a sickening odour from a cod or turbot slung on the outside of our open windows, the said fish having perhaps been left two or three days in the coach-office before Willie remembered that he had been commissioned to bring it for a dinner-party. The windows of the coach were seldom whole; and seldom did we fail to get either an ear-ache or a gum-boil from the wind whistling through one of the crannies. It was ludicrous to see invalids going out to Aldburgh in quest of the health to be inhaled with its pure mountain breezes, and frequently commencing their residence there with an addition, incurred by the journey, to their ordinary ailments. I have sometimes been obliged on one of my journeys by this conveyance to sit for half the time holding the door shut by a strap, the ordinary means of closing being out of order. Arrived at length at our destination, our woes could scarcely be said to have ended. Luggage had been left behind or given out at the stopping-places instead of other packages, which had been carefully brought on. Articles of dress belonging to the lady-passengers, and carefully packed by them in handboxes, were found to have been crushed and wetted irremediably. Sad was it to hear the lamentations of the fair proprietor over perhaps a once gay turban in which great triumphs had been expected, as it would be extracted from its frail case, bearing much the appearance of a bunch of sea-weed.

At times, however, there was a mixture of agreeables in the Aldburgh coach; and I cannot reflect without

sorrow at the breaking up of the many associations connected with the old mode of travel. One who, like myself, travelled frequently by the coach, became acquainted with the principal families in the district, and all the characters along the line of road. Your periodical travellers were soon discovered: the farmers on the market-days, taken up at various points; the city-merchant on a Saturday, repairing to his family then living in the country; the clergyman on synod or assembly occasions; and the angler and the sportsman in their various seasons. There, too, you would frequently meet the gentleman who was amiably weak on the beauties of his native town, the place to which the coach was daily destined. How eloquent he was on its amenities, its healthiness—'pleasant the air, and light the soil.' He escaped monthly from the capital to draw an inspiration of the health-restoring atmosphere, and to fish once more the pools which never failed of trout. He was a living advertisement for the town; he could recommend you the proper inn, the comfortable lodgings, and the most respectable dealers. He could inform you on what days such a butcher had beef—scorning the base insinuation of a fellow-passenger that mutton was the only butcher-meat of the district. The awe-struck appearance of the insides would at times admonish you that a squire was squeezed in beside you; and when he was put down at the porter's lodge, and his numerous trunks reverentially deposited by the driver, the conversation became brisker, and the departed gentleman was turned inside out, his virtues and vices magnified or decried, according to the whim of the passengers or the humours of the time. The same awe was not always observed; for even in the rural districts of Scotland there are some unimpressible men who would push a snuff-box into the hands of the most distressingly mighty-looking aristocrat, and compel him to vouchsafe a reply. The various stoppages, also, at particular points, brought out a set of characters with whom we renewed our intercourse at each trip, thus getting, at times, an insight into the doings of the great folks in the neighbourhood. An enormous basket of fish let down at one lodge gave indication of a great dinner at the hall; the deposition of a squeamish lady's-maid, charged with numerous port-manteaus, the arrival of a great family at the castle. The inmates of certain public-houses, where parcels or trunks were left for the neighbourhood, were familiar to us; their raillery with the driver and the outsiders, we anticipated as a periodical treat. And at some villages, which could not boast of a public-house, there was always some active man, who, seemingly for the public good, left his loom or his stool, and charged himself with the reception of messages and parcels for the whole country round. As surely as the buzz of a fly in the web brought out the watchful spider, would the distant rumble of the coach evoke from his employment the expected man of all work, who, having thrown aside his shuttle or his last, stood bareheaded and coatless, ready to scan the inmates of the coach, and carefully receive the communications for the parish. One such as this we were always glad to see at the little village of —, who, while laying aside reverentially a parcel for the manse or hall, was not unmindful of the trunk of the country lass, or the letter for the shepherd in the distant glen. And shall we never again see that benevolent twinkle which recognised every passenger—that intelligent search which shewed that he knew better where the parcels were stowed than the driver—that sedulous care which, while uplifting the females of the place on the coach, did so with the most ingenious and fatherly gathering of their dresses? And have we heard for the last time that pleasant voice which used to bid a good-day to half of the passengers, and sometimes lent a friendly caution to the

excited Jehu himself? All this has passed: no longer will the blast of the guard or the shout of the coachman awake from sleep the alarmed occupants of the train of carts on their way to the distant coal-hill; no longer will the white-headed urchins of the hamlet scream delight or defiance to the long-expected coach, and pursue it with yells to the end of the town; no longer will the stoutest of them pant and labour for a mile in its wake till the expected penny, chucked out by some compassionate philanthropist, sends them back to the village. The old hill-farmer will no longer draw to the side of the road with his battered gig, casting a timid and reverential eye on the towered coach, as it sweeps furiously on. The traffic itself on the road is changed: the carrier's wain has disappeared, and with it the bull-dog which was the terror of all the children on the way; the brewer's van, with its portly horse, is no longer seen at the change-house, where, at the cross-road, were never wanting rows of cart-horses, with exhausted nose-bags, patiently awaiting the close of the protracted revel of their masters. The drove of cattle, urged on by shouting and foaming drivers, no longer trespasses on the slightly protected garden of the villager, but is compressed into the truck, over which they gaze with a look of stupid resignation. The road itself will change: the ruts will become less worn, the sides more verdant; and the breakers of stones, who so frequently gazed from nooks by the way with goggled curiosity and suspended hammer on the passing coach, are few and far between. The anvil is mute in the stithy; the last blast is blown, and the brawny smith with his lusty sons is now in the Far West. The parish school suffers in the change: the children of the farmer and the laird are now wafted daily in the train to some school in the neighbouring town or capital; and the vexed teacher, well versed in classic and mathematic lore, must condescend to the labours of an infant school. The toll-house is a mockery, its receipts not being sufficient to support the old man who has scarcely strength to throw open its portals; and the change-house, with its sanded floor, often a welcome sight to the traveller on foot on a sultry day, is now a private house, uninviting and impervious. The very aspect of the towns and villages is changed: you see them from new points of view, and the unrepresentable is often brought out painfully.

The old associations, the amusement and variety of travel, whether on foot or by coach, have passed away. The divergence of the pedestrian is gone, with all its suggestions and entertainments: the spring by the side of the way, at which you never failed to rest, and from which you rose refreshed, your hat 'moist with water-drops, as if it scooped the stream;' the runlet, where water-cresses were to be had in perfection; the knoll, whose ascent gave a distant view of some place of celebrity; the wood from which you could select your walking-staff—are now places comparatively unknown. This divergence could not be indulged in a stage-coach—but even in its day, there were many stops by the way, when something might be learned of the people through whom you were passing. We might even communicate with the return-coach, or scream out a message hastily as it passed; and when bent in the same direction, we could have kept up a conversation with a friend in his gig as he kept close behind with his horse's nose puffing into the basket; or, provided he could ride well, have him with us at the side of the coach, joking and galloping at the same time. But now, we pass each other in a whiff: the father knows not the features of his son in the crossing train. Even at the stations, where we are detained a second or two, there is an absence of all characters; one formal official twangs out the name of his village, as if trying to impress the passengers with the idea that it was a claim to recognition; but not a sash is drawn down

for the purpose of looking out; a mummy propriety occupies every passenger; the bell rings, the whistle sounds, and away whisks the monotonous and artificial mass of human beings.

MR CROSSE, THE ELECTRICIAN.

MR ANDREW CROSSE was a Somersetshire gentleman, of moderate fortune, who devoted himself with extraordinary zeal to experiments in electricity, and achieved a fame in that department of science. He died in 1855, at the age of seventy-one, and his widow has published a biographical volume regarding him, from which we learn that he was a man of ardent temperament and of singularly upright and truthful nature, with much of that simplicity which so often is seen forming an element of greatness. His old ancestral seat, Fyne Court, and his estate of Broomfield, occupy a retired but beautiful situation on the skirts of the Quantock Hills. He had in the course of time filled his house with electrical apparatus, and even extended it to the trees of his park, securing thereby, as may well be supposed, the alarmed wonder of the country-people, and probably inducing better educated neighbours to regard him as a little mad. In reality, he was a philosopher of the rarest stamp, one disposed to pursue nature into her coyest recesses, and wring from her her most mystic secrets, but all for the good of his kind, and in no observable degree for self-glorification.

In the early part of his career, Mr Crosse's attention was attracted to the crystals on the roof of a cave in his neighbourhood. He pondered on the laws which regulate the growth of crystals, and felt convinced that it was caused by some peculiar attraction. The idea of electric attraction occurred to him, and, taking home some of the water which dropped from the roof of the cave, he exposed it to the action of a voltaic battery, when, in about ten days, he was rewarded by seeing crystals forming on the negative platinum wire, which proved to be composed of carbonate of lime. When he repeated the experiment in the dark, the result was more quickly attained. Thus Mr Crosse simulated in his laboratory one of the hitherto most mysterious of the processes of nature. He pursued this line of research for nearly thirty years, totally unknown to the world, when in 1836 he was in a manner discovered by the British Association. Being induced to attend the meeting of that body at Bristol, he and his researches became known to Dr Buckland, who took an opportunity of speaking of them, introducing Mr Crosse as 'a man unconnected with any scientific body,' who had 'actually made no less than twenty-four minerals and even crystalline quartz.' The audience regarded him with astonishment, and their feelings were wound to a high pitch when they heard himself relate his experiments and their results. He owned to having made crystals of quartz and of arragonite, carbonates of lime, lead, and copper, besides more than twenty other artificial minerals. He considered it possible to make even the diamond, and expressed his belief that every kind of mineral would yet be formed by the ingenuity of man. The meeting got into a state of high excitement about Mr Crosse and his singular electrical operations. Compliments were showered upon him from all quarters; he became the especial 'lion' of the hour. These demonstrations, novel as they were, affected him not, and before the end of the week, he had slipped away, and was once more buried in his Somersetshire solitude.

A visitor at this time described Mr Crosse as a middle-aged man, of light active figure, intellectual cast of countenance, and the voice and movements of a person enjoying constant health and good spirits. His conversation was of a character entirely his own. 'Particularly striking is Mr Crosse's eloquence, when he tells you the wonders of his favourite science of

electricity, of its mysterious agencies in the natural phenomena of the heavens above, of the earth beneath, and of the waters under the earth; how it rules alike the motions of the planets and the arrangement of atoms; how it broods in the air, rides on the mist, travels with the light, wanders through space, attracts in the aurora, terrifies in the thunder-storm, rules the growth of plants, and shapes all substances, from the fragile crystals of ice to the diamond, which it makes by toil continued for ages in the womb of the solid globe. As he describes to you all these wonders, not imaginations of a dreamer, but realities which he has himself seen and proved, by producing, by the same agent and the same process, only in a lesser degree, the same results, his face is lighted up, his eyes are fixed upon the ceiling, present things seem to have disappeared from him, lost in the greater vividness of ideas which his full mind throngs before him; he pours out his words in an unfeeling stream; but though he has a command of epithets, he finds language inadequate to express his conceptions of the might of that mysterious element which, though so very mighty that it could annihilate a world as easily as it lifts a feather, he has summoned from its throne, compelled into his presence, guided with his hand, and made to do his bidding!—thus surpassing the fabled feats of the enchanters of old.'

The visitor entered the philosophical room, which he found sixty feet long, with a lofty arched roof, having been originally built as a music-hall. Here he saw an immense number of jars and gallipots, containing fluids on which electricity was operating for the production of crystals. 'But,' says he, 'you are startled in the midst of your observations by the smart crackling sound that attends the passage of the electrical spark; you hear also the rumbling of distant thunder. The rain is already plashing in great drops against the glass, and the sound of the passing sparks continues to startle your ear. Your host is in high glee, for a battery of electricity is about to come within his reach a thousandfold more powerful than all those in the room strung together. You follow his hasty steps to the organ-gallery, and curiously approach the spot whence the noise proceeds that has attracted your notice. You see at the window a huge brass conductor, with a discharging rod near it passing into the floor, and from the one nob to the other, sparks are leaping with increasing rapidity and noise, rap, rap, rap—bang, bang, bang. You are afraid to approach near this terrible engine, and well you may; for every spark that passes would kill twenty men at one blow, if they were linked together hand in hand, and the spark sent through the circle. Almost trembling, you note that from this conductor wires pass off without the window, and the electric fluid is conducted harmlessly away. On the instrument itself is inscribed, in large letters, the warning words, "Noli me tangere." Nevertheless, your host does not fear. He approaches as boldly as if the flowing stream of fire were a harmless spark. Armed with his insulated rod, he plays with the mighty power; he directs it where he will; he sends it into his batteries: having charged them thus, he shews you how wire is melted, dissipated in a moment, by its passage; how metals—silver, gold, and tin—are inflamed, and burn like paper, only with most brilliant hues. He shews you a mimic aurora, and a falling-star, and so proves to you the cause of those beautiful phenomena; and then he tells you, that the wires you had noticed as passing from tree to tree round the grounds, were connected with the conductor before you; that they collected the electricity of the atmosphere as it floated by, and brought it into the room in the shape of the sparks that you had witnessed with such awe.'

The crystal-producing operations were the subject of nearly unmixed admiration, and for some months

Mr Crosse stood on the pinnacle of fame as a great and original discoverer in science. People spoke of his *making* crystals, without either seeing that he in reality only arranged the conditions under which nature did the work, or imagining that such a creative effort as they attributed to him involved any impiety. It was by and by announced, unauthorisedly, that while Mr Crosse was experimenting with some highly caustic solutions, out of contact with atmospheric air, there had appeared, as if gradually growing from specks, between the poles of the voltaic circuit, certain insects of the *acar*us tribe. Mr Crosse himself made no pretension on the subject; at no time was he ever able to say more than that the insects always appeared under certain conditions, and not otherwise. It was, however, at once assumed that he now set himself forth as having developed animal life from inorganic elements—an idea most odious to both scientific and religious men. Instantly, he was assailed from a thousand quarters. Objections of the nature of pure assumptions were admitted as conclusive that the insects were produced from ova, according to the ordinary rules of nature. Serious, but weak people denounced him as an enemy of religion, though the fact was that Mr Crosse at all times of his life cultivated a pious frame of mind. The lustre that had fallen on his name was dimmed in a moment, and, notwithstanding all his protestations of innocence, it never revived. We have been assured that many honours which would naturally have been bestowed on the discoverer of the crystallising process, were withheld by reason of the unpopularity which arose from the vulgar error regarding the *acar*i.

Little liable to be affected by the praise or blame of man, Mr Crosse continued, for the remaining eighteen years of his life, to pursue his experiments. He simulated the making of metallic *lodes* or veins in clay; he caused the electric fluid to tear pure gold in pieces. He always spoke as feeling life to be too short for what he had to do. 'The real motto of his laboratory,' says Mrs Crosse, 'was, "It is better to follow nature blind-fold, than art with both eyes open." This expression explains the character of his mind, and the manner in which he sought results. When he walked out, he read, not in the book of man, but in the book of God. His acute powers of observation would reveal to him some peculiarity in the organisation of plants or combination of mineral substances, which often proved the first suggestion for a train of interesting experiments. Mr Crosse ever evinced the most wonderful patience in his scientific arrangements; for months, even for years, he would wait for results, and watch the slow induration of what he hoped might be an agate, or the minute aggregation of crystals, whose slowly developed facets he would carefully note down from time to time. At an early period of his experiments on crystalline formations, he was not unfrequently disappointed, from the fact of his having employed too strong an electric action. He used to say: "You cannot hurry nature;" too rapid an action throws down the substance in an amorphous state; atoms seem only to assume a crystalline form when they have time to arrange themselves in a state of polarisation to the surrounding atoms.'

At another time he wrote: 'When misfortune oppresses, and the cares of life thicken around us, how delightful is it to retire into the recesses of one's own mind, and plan with a view to carrying out those scientific arrangements, with a humble hope of benefiting our country, improving our own understandings, and finding unspeakable consolation in the study of the boundless works of our Maker! Often have I, when in perfect solitude, sprung up in a burst of school-boy delight at the instant of a successful termination of a tremblingly anticipated result. Not all the applause of the world could repay the real lover of science for the loss of such a moment as this.'

Though Mrs Crosse only attempts to give detached 'memorials' of her husband, the public owes her large thanks for her task, which certainly preserves for us some conception of a most remarkable man, sure in time to take a high place in the history of science. Her narration is often very animated, and her expressions striking and appropriate. The volume contains many specimens of poetry by her husband. They are far above mediocrity; yet we could have wished that he had never given to the muses any part of that time which might have been so much more worthily bestowed on science.

MUSIC OF THE STREETS AND CELLARS.

It is an April evening, colder than April evenings were wont to be in our childhood, but still bright and lovely as the young spring ever is. The sea is dancing in a fresh breeze from the south, and glittering with snowy crests of foam; the clear blue sky has here and there a mass of downy cloud resting on its deep azure, and from the esplanade there floats up the hill a sound—always the harbinger of spring and summer here—of street-music. How well in accordance are the sounds with those strange stirrings of memory and melancholy which the early season causes in most of us.

We look before and after,
And pine for what is not;
Our sincerest laughter
With some pain is fraught;

Our sweetest songs are those that tell of saddest thought;

Most people who have any sympathy with sounds can respond truly to Jessica's assertion, and say:

I am never merry when I hear sweet music;

but this softening effect of it is peculiarly felt, we believe, when the strain floats unconfin'd upon the air, when, as Shelley says,

A strain of sweetest sound
Wraps itself the wind around,
Until the voiceless wind be music too.

There is nothing more touching, in our opinion, than street-music; we can—as the musicians are frequently unseen—divest ourselves, when listening to it, of a thought of the performers, and imagine the sounds to be the 'airy tongues' of Milton, or the floating, fleecy magic that made Prospero's island

Full of noises,

Sounds and sweet airs that give delight to hurt not;

or, with a more human and less selfish sympathy, we can give a thought and a sigh to those who have perhaps wandered from their own land to gain a scant subsistence beneath the ungenial sky of the strange—the itinerant musicians.

A strange life theirs must be! such a compound of sweetness and sadness, pleasure and misery; for many of these wanderers have great taste for the art and much apparent enjoyment in its exercise. Last summer, an Italian boy, who played the harp charmingly, performed upon our lawn for some half-hour or more, and appeared much more gratified by our admiration and understanding of his skill than by the pecuniary recompense of it. What links they are, too, of the present with the past! Thoughts of troubadours and wandering minstrels, of Welsh bards and 'plaided strangers' with their mournful bagpipes, flit through the mind as we listen, and come as awakened echoes of the past. Dreams of Blondel and Rizzio, of 'le petit Lully,' and of many another wandering minstrel and hand, are brought back by the sounds even now floating on the air. That very melody they play was composed by a plaided stranger of higher grade and of more noble itinerancy; it is the *Annie Laurie* of poor Findlater.

Street-music, like everything else, has made a step forward during the last fifty years. The old-established organ-tunes even are changed; the Hundredth Psalm, *Auld Lang Syne*, and *Jim Crow*, have given place to airs from operas, and even to Beethoven's waltzes; whilst the street-bands and separate itinerants perform, and often in creditable style, music of a very good and even classical description. It would be amusing to trace the history of street-music in England from its earliest days to the present; but the subject thus carried out would require more space than the pages of the *Journal* allow. There would be the romances of real life to which we have already alluded; the famous fight of the fiddlers on the Welsh marches; the inn-music, waits, &c., of Elizabeth's and the preceding reigns; and the itinerant musicians of the Civil War, who were so numerous that the parliament made an ordinance declaring them vagrants. If no very great judges of the art, our ancestors were nevertheless lovers of it: we allude of course to the great body of the nation, the people; for the practice of having music in taverns and inns is constantly alluded to in our old English writers. It was not alone the courtier who might say: 'I am advised to give her music o' mornings; they say it will penetrate.' The itinerant fiddler, according to Bishop Earle, 'made it his business to get the names of the worshipful who slept at an inn, in order that he might salute them by their names at their rising in the morning;' and indeed at the greater inns, such as we should now call hotels, there were musicians who appear to have been in some sort retainers of the house. Fynes Moryson has given a hint of this in his *Itinerary*, when describing the arrival of a gentleman at an inn: 'While he eates, if he have company especially, he shall be offred musicke, which he may freely take or refuse; and if he be solitary, the musicians will give him the good-day with music in the morning.'

The last of these musicians who made it a regular custom to frequent taverns—'going abusking,' as it was called—was Thomas Eccles, a brother of the song-composer of Queen Anne's reign. The following account of him is given by one who heard this last of the inn-minstrels play in 1735:

'It was about the month of November that I, with some friends, were met to spend the evening at a tavern in the city, when a man, in a mean but decent garb, was introduced to us by the waiter. Immediately upon opening the door, I heard the twang of one of his strings from under his coat, which was accompanied by the question: "Gentlemen, will you please to hear any music?" Our curiosity, and the modesty of the man's deportment, inclined us to say yes; and music he gave us such as I had never heard before, nor shall again under the same circumstances. With as fine and delicate a hand as I ever heard, he played the whole fifth and ninth solo of Corelli, two songs of Mr Handel—"Del minaccian," in *Otho*, and "Spero mio caro bene," in *Admetus*. In short, his performance was such as would command the attention of the nicest ear, and left us, his auditors, much at a loss to guess who he was. He made no secret of his name; he said he was Thomas Eccles, the youngest of three brothers; and that Henry, the middle one, had been his master, and was then in the service of the king of France. We were very little disposed to credit the account he gave us of his brother's situation in France; but the collection of solos that have been published by him at Paris, puts it out of question.'

Unhappily, the moral character of poor Thomas Eccles was far inferior to his artistic one. He was idle, and given to drink; he lodged near Temple Bar, and was well known to the musicians of his time.

Contemporary with this itinerant musician lived the once celebrated small-coal man, Thomas Britton, who established the first concert in London. It may not

be unentertaining—we believe it may even be instructive—to give some account of this man, of whom we are told, that as he walked along the streets in his blue linen frock, and with his sack of small-coals on his back, the passers-by would say: 'There goes the famous small-coal man, who is a lover of learning, a performer in music, and a companion of gentlemen.'

Thomas Britton was born at Higham Ferrers, Northamptonshire. He left his native place while a boy, and bound himself apprentice to a small-coal man in St John Baptist's Street. 'After he had served his full time of seven years, his master gave him a sum of money not to set up business. Upon this, Tom went into Northamptonshire again, and after he had spent his money, he returned again to London, set up the small-coal trade [we are sorry for this breach of promise], and withal took a stable, and turned it into a house, which stood the next door to the little gate of St John's of Jerusalem next Clerkenwell Green. Some time after he had settled here, he became acquainted with Dr Garenners, his near neighbour, by which means he became an excellent chemist; and perhaps he performed such things in that profession as had never been done before, with little cost and charge, by the help of a moving laboratory, that was contrived and built by himself; which was much admired by all of that faculty that happened to see it; inasmuch that a certain gentleman of Wales was so much taken with it, that he was at the expense of carrying him down into that country on purpose to build him such another, which Tom performed to the gentleman's very great satisfaction; and for the same he received from him a very handsome and generous gratuity. Besides his great skill in chemistry, he was as famous for his knowledge of the theory of music, in the practical part of which faculty he was likewise very considerable. He was so much addicted to it, that he pricked with his own hand, very neatly and accurately, and left behind him a valuable collection of music . . . which was sold upon his death for near a hundred pounds.*'

It was his skill in music, however, not in chemistry, which won for Britton the extraordinary place he obtained in society, which he retained, also, without any change of station, habits, or occupation. The stable, transformed into a house, as Hearne informs us, was very old, low built, and mean—fit habitation only for one of the humblest station; yet there assembled the wit, genius, and beauty of England, and there were heard such strains as Her Majesty's Theatre have since scarcely surpassed. On the ground-floor was a repository for coals; over it a long, narrow room, so low, that a tall man could but just stand upright in it. The stairs to this room were on the outside of the house, and could with difficulty be ascended. This chamber was the scene of his concerts, begun with the assistance—not pecuniary aid, for they were free of expense—of Sir Roger l'Estrange, 'a very musical gentleman,' and frequented by all the great geniuses of the age. Here, Dr Pepusch, or the great Handel, played the harpsichord; Bannister or Medler, the first violin; Hughes, a poet, Woolaston the painter, Shuttleworth, &c., on other instruments. Matthew Dubourg was then but a child; but his first solo played in public was performed at Britton's concert, 'standing on a joint-stool;' and we are told the poor child was so awed at the splendid assembly, that he was near falling to the ground.

In addition to his reputation as a musician, Britton was known as an acute collector of rare old books and manuscripts; possessing, it may consequently be inferred, no small portion of literary taste. In these pursuits, his familiar associates were the Earls of Oxford, Pembroke, Sunderland, Winchelsea, and the Duke of Devonshire. These noblemen were in the

* From Hearne's Appendix to his *Hemingi Chartularii Ecclesie Wygorniensis*.

habit of meeting, at their leisure, at the shop of a bookseller called Christopher Bateman, at the corner of Ave Maria Lane, in Paternoster Row. As St Paul's clock struck twelve, Britton, who had then finished his morning rounds, would arrive there also, clad in his blue frock; and pitching his sack of small-coal on the bulk of Mr Bateman's shop-window, would go in and join them; and after a conversation which generally lasted about an hour, they were wont to adjourn to the Mourning Bush,* Aldersgate, where they dined, and spent the remainder of the day.

It was doubtless a happy thing for Britton that none of his noble friends made any attempt to remove him from the station in which it had pleased God to place him. They gave him their sympathy, their esteem, their society; and left him the habits, the associations, the ease, and the independence of his own birth: an example which it would be ever wise to follow. The error since has been the supposing that such tastes and so much cultivation render a man unfit for his station—displace and uproot him, as it were, and impose on him a different way of living. The blunder began when good Queen Charlotte recompensed a witty novelist by imposing on her the duties and habits of a lady's-maid; and it has gone on ever since. Let us learn from Thomas Britton that the arts may enlighten the lowliest dwelling, and cheer the humblest lot, without appearing ungraceful or out of place.

The circumstances of Britton's death were as remarkable as those of his life. Amongst the usual performers at his wonderful concerts was a magistrate for Middlesex, called Justice Robe, a man fond of practical jokes. At that period, the now-well-known trick of ventriloquism had been little heard of—to Britton, it was probably quite unknown—Mr Robe had become acquainted with a blacksmith named Honeyman, who possessed this power, and was called, in consequence, the Talking Smith.

During the time that Dr Sacheverell was under censure, and had a great resort of friends to his house, this fellow got himself admitted, pretending that he came from a couple who wished to be married by the doctor. Dr Sacheverell, one of the stoutest and most athletic men then living, was so terrified by him during the few minutes he was in the room, that he was found almost in fits. Aware of these extraordinary powers of Honeyman, and probably, also, of the fact that poor Britton possessed books on the Rosicrucian philosophy, and had imbibed some fantasies on the subject of spirits, &c., from them, Robe had the folly and wickedness of trying the strength of the coalman's nerves. He invited him and Honeyman together to his house; and during the evening, Honeyman, without moving his lips, or seeming to speak, threw a voice into the air, which announced that Britton had but a few days to live, bidding him at the same time fall on his knees and say the Lord's Prayer, as the only means of avoiding his doom.

The poor terrified musician obeyed; went home, took to his bed, and never rose from it again. His was one of those finely strung natures which respond fatally to any stroke upon the imagination. He believed the warning as Mozart did the mysterious order for a requiem, and his fine organisation yielded to his disordered fancy.

No more of those divine concerts in the poor coalman's hospitable dwelling, no more strange chemical experiments or pleasant chats under the shelter of the Mourning Bush; the lying voice had been an unconscious prophet—Tom Britton died, and was buried;

followed to his grave, in Clerkenwell Churchyard, by a great concourse of people, who, to their honour, had learned to appreciate genius, honesty, and generosity, under the poor coalman's blue linen gown.

There is a picture of him in the Museum, painted by his friend Woolaston, beneath which are the following lines:

Though doomed to small-coal, yet to arts allied—
Rich without wealth, and famous without pride;
Music's best patron, judge of books and men,
Beloved and honoured by Apollo's train.
In Greece or Rome, sure never did appear
So bright a genius in so dark a sphere;
More of the man had artfully been saved,
Had Kneller painted and had Vertue graved.

It is greatly to be desired that a taste for music good as that manifested by these 'sons of the people' should spread abroad amongst them now; and it appears likely to be the case from the improved style of the street-music. Let every sweet strain that floats upon the air hereafter, bring to us the hope and wish that this gentle taste may be, indeed, so stealthy upon the hearts of Englishmen, that it may work greater wonder than it did of yore, in the days of Amphion or Orpheus—that of overcoming the evil of the gin-palace and the beer-shop, and make men meet together, not for the purposes of debasing, but ennobling their nature.

A few such concerts as Britton commenced—humble, unpretending, and elevating—would as much tend to exalt the people as his tastes did to exalt him. Let us trust that we may yet see the day of music amongst the million.

C O B.

THERE are few objects of a peaceful nature more exquisite than the scattered villages of Devonshire, lying concealed amidst their pretty gardens, their fine pastures, and ruddy orchards, or crowning the high upland, and infusing an air of life into the rich and wooded scenery around. But the character of the appearance of the cottages themselves are for the most part little calculated, on a close inspection, to give pleasure to any eye save that of the artist, who rests in the broken and uncertain outline, and in the colour of poverty and decay. Formed out of the earth, which they stand, their exterior is often untidy and dilapidated. The line of wall is seldom true. Dead over at the first, perhaps, with a whitewash of lime or coated with a coarse plastering, damp, frost, and total neglect have done their work. The red, material stands uncovered in all the deformity of nakedness, and the Cob, however dry and comfortable may be the shelter it affords, has ceased, in the language of Mr Loudon, 'to have any beauty, because it has no expression.'

The etymology of cob has long puzzled the lexicographers. Neither Jameson in the Scottish dictionary nor Lye in the Anglo-Saxon, nor Webster in the American, has attempted to account for it. John can only see in it a constituent in the composition of low terms. Nor do the Devonian philologists themselves throw any important light on its derivation. Leaving cob, however, to laugh at the etymologists, we shall proceed to put our readers in possession of the method of constructing it; and if Charles is struck out the most ingenious theory with regard to the former, Mr Loudon has undoubtedly given us the most workmanlike account of the latter. We are therefore, although ourselves 'to the manner born,' little more than abstract from his amusing hints as to the mode of preparing this most

* Our readers are probably aware that a bush was the old sign for a tavern. The owner of this tavern was so affected by the execution of King Charles I., that he put his bush into mourning, by painting it black; hence the house retained, for more than a century, the name of the 'Mourning Bush.'

composition as may be most likely to interest, and, we hope, instruct our readers.*

The cob-walls of the west of England are composed of earth and straw mixed up with water, like mortar, and well beaten and trodden together. The earth nearest at hand is generally used, and the more loamy it is, the better is it adapted for the purpose. The walls, which are generally two feet thick, are raised upon a foundation of stone-work; and the higher the stone-work is carried, the more secure is the cob from the moisture of the ground. When the walls have been raised to a certain height, they are allowed some weeks to settle—the length of time of course depending on the state of the atmosphere. The first layer or *raise*—to use the Devonian expression—never exceeds five feet, and is sometimes restricted to three; the second is not so high; while every succeeding one is diminished in height as the building advances. The solidity of cob-walls depends so much on the process of making, that if the latter be hurried, the former are sure to be crippled, and to swerve from the perpendicular. It is usual to pare down the sides of each successive raise before another is added, the instrument used—which is called the ‘cob-parer’—being like the peel or shovel used by bakers for removing the bread from the oven. As the work advances, the lintels of the doors, windows, cupboards, or other recesses are bedded on cross-pieces, and put in. The walls, however, are carried up solid, and the respective openings are not cut out until the work has well settled. In the process of building, the workmen use common pitchforks; and while one is on the wall arranging and treading down the cob, another stands below, and pitches it up to him. When the walls have reached their proper altitude, and have fairly settled down, the process of roofing commences. The rafters are fixed, and afterwards thatched with wheat-straw, or reed, as it is called in Devonshire, which consists of the stiff, unbruised, unbroken stalks which have been carefully separated by the thrasher from the fodder-straw, and bound up in large sheaves called *niches*. In the following spring, the walls are plastered very smoothly with lime-and-hair mortar, and the plaster covered with a coating of rough-cast, composed of fine gravel, carefully screened and mixed with pure newly slaked lime and water, till the whole becomes of the consistence of a semi-fluid. This coating is forcibly thrown, or slap-dashed, as it is called, upon the wall with a large trowel, after which it is brushed over by the workman with the lime-liquid in the pail, which, like the sprinkling of comfits with frothed sugar, gives the last finishing-touch of beauty to the cob. A cob-house of two stories takes about two years to build; and there are instances of houses so constructed as far back as the reign of Elizabeth being found at this day in a state of perfect preservation. In the words of the Devonshire adage, all that cob wants to insure durability, ‘is a good hat and a good pair of shoes.’

That cob should be so generally adopted in a country abounding, as the west of England does, in stone, marble, and granite, is undoubtedly owing to its cheapness, the facility with which it is wrought, and the dry, healthy, and comfortable dwelling which it forms. As regards cheapness, it will cost, speaking roughly, about a third of stone, and a fifth of brick-work; while, on the score of comfort, the thickness and non-conducting properties of the walls preserve a mean temperature within, as well during the heats of summer as the frosts of winter. But the material is ill adapted for barns and garden-walls; it harbours vermin, and is apt to be undermined by rats and mice.

The antiquity of cob is much less doubtful than its etymology. There can be no doubt that it was

introduced into Cornwall and Devon by the Phœnicians, as it was introduced by them into all their other colonies. Although these princely merchants carried the arts of building and carpentry to the greatest perfection, it is probable that these were only displayed, to any considerable extent, in the temples of their deities, and the palaces of their kings and nobles. The Tyrian and Carthaginian watch-towers which bristled along the African and Iberian shores, we know from Sanchoniatho to have been built of a compound of stubble and mud, kneaded together like dough, and dried in the sun; and so probably were the dwellings of the vast mass of the Phœnician people. Ezekiel, who, of all the Hebrew writers, was the best acquainted with their customs, when speaking of breaking through a wall, invariably makes use of a word which would be utterly inapplicable to one of stone or brick—‘I *digged* through the wall with mine hand.’ And that houses formed of the same material were common in Palestine, is evident from the identical expression of Ezekiel being twice used by our Saviour in the sixth chapter of St Matthew: ‘Lay yourselves up treasures, where thieves do not break through (literally, ‘dig through’) nor steal.’

In like manner, we find abundant traces of cob having been known to the ancient Greeks, and used by them very much in the same way as it is now wrought in Devonshire. Thucydides, in describing, in his second book, the works thrown up by the besiegers at the leaguer of Plataeæ, mentions the confining of the mud in layers of reed, just as it is confined at this day in Devon by what are there called *spires*—a species of rush which grows in great abundance in the neighbourhood of Topham. Xenophon, too, in narrating the ingenious manner in which Agesipolis, king of Sparta, took the city of Mantinea, states that he dammed up the river which flowed round the town, and, by thus softening the walls, caused them to fall in. The Mantineans, he adds, when they rebuilt them, carried up the stone-foundation of the new cob (σκληρόν) many feet, in order to prevent a recurrence of the same stratagem. These foundations are described by Colonel Leake, in his work on the *Morea*, as very perfect, and their intention as quite obvious. The masonry, which is complete as high as it extends, is clearly too low to have formed of itself a defensive wall.

In Egypt, cob was in familiar use at least as far back as the times of the Hyksos, or shepherd-kings. This is evidenced by the task-work assigned to the Jews by Pharaoh, as detailed in the fifth chapter of Exodus: ‘There shall be no straw given, yet shall ye deliver the tale of bricks.’ ‘What the use of straw was,’ says Bishop Patrick, ‘in making bricks is variously conjectured: some think it was mixed with the clay to make the brick more solid’—this being, as we have seen, the precise object for which straw is used in cob. Josephus tells us that the task-work of the captive Jews in Egypt was the building of walls and a pyramid; and many have supposed that the pyramids of Dahshour, which are composed of sun-dried bricks made of mud and cut straw, were the very works which made the lives of the Israelites ‘bitter with hard bondage.’

Ascending to a still more remote antiquity, we find that the tower which the Cainite worshippers of fire erected to their idol Bel on the plains of Babylonia—where stone is comparatively rare, and wood, as Heeren says, is still more scarce than stone—was faced with brickwork, cemented with slime, bitumen, mud, or whatever the *chemar* was; the centre, according to the conjectures of Bryant and Rich, being composed of earth. What this brickwork was probably like, we learn from the latter author, who describes the sun-burnt bricks of the *Birs Nimroud* and the *Mujalibbe* as looking like ‘thick clumsy soda

* For the rest, we can only refer them to Mr Loudon's work, the *Encyclopædia of Architecture*, No. 639.

of earth, in which are seen broken reeds or chopped straw, used for the obvious purpose of binding them'—a description which corresponds very closely with the appearance of decayed weather-beaten cob. The walls which surrounded the city were in like manner, as we learn from Herodotus, built of the earth excavated from the moat which encircled them—a statement fully corroborated by Diodorus Siculus, who gives the most particular account of them. The original walls having perished, or, to adopt the strong expression of the historian, melted into air, they were rebuilt, probably by Nebuchadnezzar, partly of burned and partly of unburned brick. In the fourth century, these renewed walls were just sufficient for the hunting preserves of the Persian king. They, too, have entirely crumbled away,

And, like the baseless fabric of a vision,
Left not a wreck behind.

We may not go further in our attempt to trace the antiquity of this favourite compound. Were we to give the reins to conjecture, it might not be impossible to make out a strong circumstantial case for its probable existence in the antediluvian period. We might dwell upon the facts that, until the days of Tubal-Cain, the art of working metals was unknown, and that, therefore, the city which Cain built could not have been constructed of wood; that chemistry being yet unborn, it could not have been of stone, or brick and mortar; that mud was the most obvious material to a tiller of the earth; and that beyond the fingers and the feet, no assistance of tools was in this case needed. But we refrain, content with being able to say of cob, as Byron has said so splendidly of the ocean:

Time writes no wrinkles on thy *muddy* brow;
As *Nimrod* first beheld thee, art thou now!

THE COURT OF CHANCERY AS IT IS.

It has been truly remarked, that the Court of Chancery is an admirable illustration of 'the dog with the bad name.' The expression, 'like being in Chancery,' and others of a similar nature, are often used by people who wish to impress upon their hearers that which is tedious, expensive, and almost endless. If property is 'thrown into Chancery,' to use a popular phrase, all hope of its ever being of any further benefit to the parties interested in it, is abandoned. The Court of Chancery has won for itself an evil reputation which still clings to it, although no longer deserved.

The Court of Chancery has been thoroughly reformed. The changes began in 1850; and in 1852 an entire revolution was effected in its mode of procedure. The various times for taking the necessary proceedings were considerably shortened, printed pleadings were substituted for written ones, and unnecessary offices, such as those of the masters in Chancery, which had long been causes of delay and expense to suitors, were abolished. In many cases, too, relief may now be had by a summary mode of procedure. Also fees are paid by stamps, and officers of the court are remunerated by salaries instead of fees, so that greater fees than those prescribed by the orders of the court can no longer be taken. Thus, and in a great many other particulars, which it is unnecessary here to detail, has the Court of Chancery been reformed and its procedure simplified, with a saving of time and cost to the suitor; yet no one believes it. Works like Mr Dickens's *Bleak House* still continue to gain credence, although written long ago, and before Chancery reform began; novelists and newspaper writers still speak of it as it was years ago; and because they do not know of, or cannot comprehend its vast changes and improvements, will not admit that any have been made. This is most unfortunate; for not only are the people of

England thus misled, but foreigners get these absurd notions into their heads, carry them home to their own countries, and represent our highest court in the realm as a monstrosity of iniquity!

There is also another class who rail against the Court of Chancery, who wish all forms and modes of procedure to be done away with, and would, no doubt, like justice to be administered after the manner of a Turkish pacha; but this is, in England, we are glad to say, an impossibility. Forms are, to a certain extent, actually necessary to prevent injustice being done by the law; for if the process of the law could be used without knowledge, cost, or trouble, by any one who might fancy himself wronged by another then would it become an engine of tyranny and oppression, and not of justice and equity.

Let us hope that the Court of Chancery, which, by reason of its reforms, has, from being the slowest become one of the speediest tribunals in the kingdom, may be regarded in its proper light, and become as popular as it has hitherto been unpopular.

FOUR SEASONS.

*Parvus Deorum cultor, et infrequens,
Insanientis dum sapienter,
Consultus erro; nunc retrorsum
Vela dare, atque iterare cursus
Cogor relictos.—HORACE.*

WHEN Life was Spring our wants were small,
The present hour the future scorning—
A stunning partner at a ball,
A place among her thoughts next morning;
No fears had we that she could lose
The varied charms our fancy lent her,
Terpsichore was then our Muse,
And Mr Thomas Moore our Mentor.

Time passed till, though our wants were few,
Hopes rose, but 'twas not hard to span 'em—
An opera-box, *paille* gloves, a new
Rig out, or ten pounds more per annum;
When deeper aspirations came,
We called in aid—Imagination,
And drew on Fancy for our Fame,
And for our Love—upon Flirtation.

Grown more sagacious, by and by,
The wants and hopes of Life advancing,
We learned to spell Love with an *i*,
And dining took the *pas* of dancing;
We smiled at Fancy; pitied youth;
In Power began Life's aims to centre;
Demurred at Faith; and doubted Truth;
Till self became both Muse and Mentor.

Another Season served to prove
Our false appraisement of Life's treasure,
We found in Trust, and Truth, and Love,
The very corner-stones of Pleasure;
That youth of heart shewed age of head;
That gaining was less sweet than giving;
That we might live, and yet be dead
To all the real joys of living.

Our dreams how shadowy and vain
We've found; and turn back truer hearted,
With humbler quest to seek again
The simple Faith in which we started;
And deeper read in Wisdom's page,
Know now how we have been beguiled, who
Suppose the objects that engage
The hopes of youth—the aims of age
Should find their end in second childhood.

THE VAGARIES OF PHYSIC.

LORD BACON assigned as a reason why the science of medicine had not advanced and kept pace with the other sciences, that 'physicians had reasoned in a circle and not in a line.' Dr Benjamin Rush compared the same science, as practised in his day, to 'an unroofed temple, cracked at the sides, and rotten at the foundation.' An American writer, who runs a tilt against every nostrum not belonging to the vegetable kingdom, hearing that Mr Wakley had recommended all poisons sold in druggists' shops to be placed on high shelves, dryly observed, that 'in that case the lower part of the establishment would generally be to let!' Seeing, then, in what bad odour the disciples of Esculapius are held even by members of their own fraternity, and how each generation, in its turn, 'kicks against the rusty curb of old father antic, the law,' we feel almost disposed to place our medical man under the conservative guardianship of that African doctor whose mode of practice is shrewdly likened by Sir John Forbes to that of the homœopathic school of medicine: the sable physician's remedy was to write his prescription on a board, and then, having carefully washed it off, to *give his patient the water to drink!* Verily, from the days of Hippocrates downwards, so many have been the odd conceits that have sprung, full-armed for mischief, from the prolific brains of the world's physicians, so many and so wonder-working the medicaments propounded, from the 'all-heal of Hercules' to 'Parr's Life Pills,' that, leaving the graver side of the subject to take care of itself, and dealing only with its 'tickled surface,' it seems as if an amusing volume might be written on the Vagaries of Physic. Omitting from our category those who have 'turned diseases to commodity,' and in whom 'there is no more faith than stewed prunes,' it would be worth while to trace the path of some one of those—and their name be legion—who, wise in their generation, have yet been led away by their own chosen and familiar will-o'-the-wisp. How have plain earnest men sometimes plunged headlong into quagmires through following the *ignis fatuus* of some particular traditionary mysticism, till, by the force of that very earnestness, they have succeeded in 'driving the grossness of the foppery into a received belief, in spite of the teeth of all rhyme and reason!' How for centuries have our fathers before us given to some old formula a full measure of simple credence heaped up and brimming over; till we, in our later generation, are tempted to cry out indignantly: 'Have we laid our brains in the sun and dried them, that they want matter to prevent such gross e'er-reaching as this?' Where now is our faith

in the 'simples' gathered beneath the moon, or plucked at some witching-hour under the 'fiery trigons?' How far have we wandered from the pastures of old father 'thyme,' lost our relish for 'sauce-alone, or Jack-by-the-hedge-side,' and discarded the safe companionship of 'Gill-go-over-the-ground!' How have we, degenerate, waged war in a crusade against 'Saracen's Confound,' and withheld from our gaping wounds the gentle succour of Teutonic 'stab-wort!' How have we set up new idols for our worship, and, like true iconoclasts, broken down the mysterious image from the inner sanctuary, the holy of holies, of physic! In medical traditionary lore, this same icon, as all searchers into by-gone authorities well know, was the image or likeness of a particular disease, said to be impressed on root, leaf, or flower, suggesting its specific virtue as a curative agent applied to the disease so indicated. It was called the *signature* of the plant. That prince of herbalists, Nicholas Culpeper, says: 'I wonder in my heart how the virtues of herbs came first to be known, if not by their *signatures*.' Now, as thou art a true man, O Nicholas, confide to us wherein it is fitting to put a bound to our credulity. In sober seriousness, if the '*signature*' be all-powerful, may there not be also—in spite of the poet—something in a *name*? May we not hope to 'put money in our purse' by imbibing an infusion of 'money-wort or herb-twopence;' or tame a quarrelsome wife by means of 'loose-strife or grass-polly?' Might not 'ashen-keys' be applied with effect to a locked-jaw; or a habit of early rising induced—under Morpheus—by an admixture of 'pot-herbs, *boiled with an old cock!*'

Have you a mote in your eye, O my brother! search diligently for the 'pearl-trefoil;' it shall more benefit you than the four-leaved shamrock of fairy celebrity: 'it hath a white spot in the leaf like a pearl. It is'—as you might have divined—'under the moon, and its icon shews that it is of a singular virtue against the pearl or pin and web in the eye.' Or, better still, take 'herb-clary;' this, too, is 'under the moon,' and goes right to the mark. 'The seed put into the eyes, clears them from moles. Wild clary is a gallant remedy, to take one of the seeds and put it in the eye, and there let it remain till it drop out of itself (*the pain will be nothing to speak on*).' Thank you, Culpeper—Nicholas, we are obliged to you, but would fain be excused. The human animal is not, it would appear, the only 'unfledged biped' beholden to the ancients: the callow fowls of the air have a wonder-working elixir for destroyed vision in 'celandine or chelidonium, so called from a Greek word signifying swallow.' But mark our oracle's reservation: 'They say, that if you put out the eyes of young swallows when they are in

the nest, the old one will recover their eyes with this herb. 'This I am confident, for I have tried it [the old sinner!], that if we mar the very apple of their eye with a needle, she will recover them again, but whether with this herb or not, I know not.' The eyes, it seems, are 'under the luminaries; the right eye of a man, and the left eye of a woman, the sun claims dominion over.' Let those who attempt to operate for strabismus, look to it, or they may get themselves into trouble. In all matters ophthalmic, the Fates themselves seem to have laboured under an obliquity of vision. Esculapius, because of the marvellous cures he performed with the blood drawn from the right veins of Medusa's head—a lady who boasted but a reversionary interest in one eye, which belonged in common to herself and her lovely sisters the Gorgons—fell under the thunders of Jove; the issue being, that the great 'luminary' Apollo himself, the father of physic, for his just vengeance inflicted on the one-eyed Cyclopes who forged the thunderbolts, was thrust incontinently from heaven, and doomed to consort with the flocks of Admetus. After this, where shall the mortal be found bold enough to undertake so delicate an operation as that for *quinting*, on either the *right eye of a man or the left eye of a woman* 'under the luminaries?' Running through the pages of our author, there is a genuine undercurrent of humour and shrewd common sense. We feel sure that he believes not in one-half he propounds with such solemn gravity. Sundry of his prescriptions savour strongly of the medicant friar's celebrated recipe for the making of flint-soup. In his concoction of simples, he slyly insinuates his 'powdered beet' or his 'cock-chicken.' Certain herbs are shewn to be peculiarly efficacious 'gathered with the dew on them'; others are of remarkable potency 'if the body be exercised after the taking thereof.' In his love of sack and canary, he is the very Falstaff of physicians. He holds forth on the virtue of moderation, but has evidently no mind to treat his friends in private with anything so meagre as 'a last year's pippin with a dish of caraways.'

Perusing some of his inimitable concoctions, we exclaim perforce: 'Why, what an epicurean rascal is this!' It would conjure up the shade of Father Mathew, only to hear him when he is busy in his distillery. In his battle with temperance, he is 'as valorous as Hector of Troy, worth two of Agamemnon.' There is 'a whole merchant's venture of Bordeaux stuff in him.' If he admonishes us to repent, truly it is 'not in sackcloth, but in new milk and old sack.' Under the head of *Rosa Solis*, or Sundew [query, mountain-dew?], is a rare specific for 'qualms and spasms of the heart. This herb is good [no doubt of it] made into a drink with aqua-vitæ and spices.' Harkken to Nicholas on the subject of the vine: 'The vine is a most gallant tree of the sun, very sympathetical with the body of man, and that is the reason that the spirit of wine is the greatest cordial among all vegetables.' He who, being sick, covets not a drink with a veritable smack of nectar in it, let him eschew the following: 'The powder of violet leaves, or a sirup of violets taken in some convenient liquor [!], and a little of the juice or sirup of lemons put into it, quenches the thirst, and gives to the drink a claret-wine colour and a fine tart relish pleasing to the taste.' If this is not a draught for Olympian Jove, 'may a cup of sack be our poison.' Here follows another 'convenient liquor': 'Take fifty kernels of peach-stones, and one hundred of the kernels of cherry-stones, a handful of elder-flowers, fresh or dried, and three pints of muscadell. O Falstaff, 'if sack and sugar be in fault, God help the wicked!' Yet he who can gravely advocate the above delectable compounds, comes down with a sly rebuke on Schola Selerni—a gentleman whose name we humbly suppose to be a corruption of

Silenus. 'Schola Selerni advises to take much wine after pears, or else they say they are as bad as poison; nay, and they curse the tree for it, too; but if a poor man find his stomach oppressed by eating pears, it is only working hard, and that will do as well as drinking wine.' Take comfort, ye sons of toil; ye shall eat pears with impunity—ay, in the sweat of your brow! After so much wine, it is not to be wondered at that our friend Nicholas should indorse the following hint against 'sweet basil.' He says: 'Hilarius, a French physician, affirms, upon his own knowledge, that an acquaintance of his, by common smelling of this herb, had a scorpion bred in his brain: something is the matter; basil and rue will not grow together, no, nor near each other, and we know rue is as great an enemy to poison as any that grows.' It was rue, in combination with figs, walnuts, and some few other ingredients, that was said to be taken daily by Michael dates, and which gave the 'Pontic monarch of old days' immunity against the poisonous assaults of his enemies. A simpler physic than this was patronised, we are told, by the grandfather of him of Utica: 'Honest old Cato used no other physic than the coleworts. I know not of what metal his body was made; this I am sure, cabbages are extremely windy, whether you take them as meat or medicine; yea, as windy meat as can be eaten, unless you eat *bagpipes* or *bellows*, and they are but seldom eaten in our days.'

Should the public be desirous of knowing how the celestial personages whose names so frequently figure as presiding over the vegetable kingdom, conducted their ministrations with reference to the animal economy of the human subject—Culpeper is their man. He has walked among the immortals, and knows their ways and their whereabouts. Like us poor mortals of this lower earth, it would appear that they have their likings and their dislikings, their love and their hate. 'Sympathy and antipathy,' be it remembered, 'are hinges upon which the whole of physic turns; and the physician who minds them not, is like a door from the hooks, more like to do a man a mischief than to secure him.' Moreover, 'he who would know the reason of the operations of the herbs, must look up as high as the stars, astrologically.' So he adds: 'To the stars went I.' Having soared thus high, but a step further, and we find him in the presence of good Jupiter himself. 'Up comes Mars to him—'O Brother Jupiter,' he says, 'thou knowest I and a couple of trines to thy house last night, the one for Aries, and the other from Scorpio; give me thy help by sympathy to cure this poor man with drinking draught of wormwood beer every morning.' So now for sympathy; now for antipathy. 'The moon was weak the other day, and she gave a man two terrible mischiefs, a dull brain and a weak sight. Mars kept his sword and comes to her—'Sister Moon,' says he, 'this man hath angered thee; but I beseech thee take no notice—he is but a fool. Prithee, be patient; I will, with my herb wormwood cure him of both mischiefs by antipathy, for thou knowest that thou and I cannot agree.' With that the moon began to quarrel: Mars not delighting much in women's tongues, went away, and did it whether she would or no.' Yet this is the 'gallant Mars!' Worse, however, follows. 'He had no sooner parted with the moon, but he met Venus—and she was as drunk as a hog!'

Enough of the immortals. One step lower, and we come to the pope. If Nicholas has an unkind word in his genial heart, he reserves it for his *bellows*. In his love for his darling simples, with their simple Saxon names, he is 'as true as truth's simplicity,' simpler than the infancy of truth.' He is not displeased to hear misletoe called *lignum sanctum*, and inveighs in no measured terms against the 'blasphemously called an herb of the three colours,' because it has three colours, and *quintessence*.

changel as a term for dead-nettle. Of sea-wormwood says: 'It hath gotten as many names as virtues—*id perhaps one more*. A papist got the toy by the id, and called it holy wormwood; and, in truth, I am opinion their giving so much holiness to herbs is a *ason there remains so little to themselves*.' But he has it done yet. 'St Peter's wort,' he says, 'rises up eater than St John's wort; and good reason, too, Peter being the greater apostle, ask the pope else! or though God would have the saints equal, the pope of another opinion. There is not a straw to choose twixt this and St John's wort, only St Peter must ve it, lest he should want pot-herbs.' Thus does icholas deal the pope a sly poke in the ribs with a rb pronounced by Dioscorides, Pliny, and Galen to be good for sciatica!

For a concluding specimen of the wisdom of our doctors in the discovery of remedies for all the ills at flesh is heir to, let us turn to the art-magic as developed in our hedgerows. We must be pardoned we place amongst our cabalistic observances some w prescribed remedies, the medicinal value of which boasted in sober seriousness: such, for example, as onions to be hung round the neck, wild tansy to be orn in the shoes, so that it be next the skin; divers herbs to be bound round the wrists of the hands—the disease to be cured lying in some distant region of the body; and vervain, as a remedy for scrofula, to be tied to the pit of the stomach by a *white ribbon* round the neck. Lastly—hear it, humanity Martin!—'A good handful of the hot, biting culrage or water-pepper ut under a horse's saddle, will make him travel the stter, although he were half-tired before.' We have the authority of Mizaldus and others for the fact, that either witch nor devil, thunder nor lightning, can arm a man in the presence of a bay-tree. Wood-eony, according to Antonius Musa, the physician o Octavius Cæsar, possesses similar miraculous properties. The power ascribed to the fig-tree is of a somewhat different character. With stories of a cock ad bull, most persons are familiar; but the connection f the latter animal with the fig-tree—a tree under the eminion of great Jove himself—is a fact not sufficiently own. 'If you tie a bull, be he ever so mad, to a fig-tree, he will quickly become tame and gentle.' The nly difficulty in the way of administering the remedy roposed seems to lie in who shall '*tell the cat*.' There ould appear to be also some mysterious connection between the same animal and fig-wort, since we are old that 'Venus owns the plant, and the *celestial bull* ill not deny it!' Again, we cannot help thinking that mouse-ear; though itself under the dominion of the moon, must have felt *tickled* when first it caught the echo of the following announcement: 'Though authors to cry out upon alchemists for attempting to fix quick-silver with this herb and moon-wort, a Roman would ot have judged a thing by the success; if it be to be fixed at-all, it is by lunar influence.'

Of all famous herbs, none is comparable to moon-wort. We would strongly advise all horse-jockeys to give it a wide berth, and Messrs Braham and Chubb especially to keep a sharp eye upon their business, if ever they find themselves in its vicinity. 'It is an herb which, they say, will open locks and unshoe such horses as tread upon it. This, some laugh to scorn, and those no small fools neither; but country people that I know call it unshoe-the-horse.' Besides, I have heard commanders say, that on White Down, in Devonshire, near Tiverton, there were found thirty horses' shoes, pulled off from the feet of the Earl of Essex's horses, being there drawn up in a body, many of them being newly shod, and no reason known, which caused great admiration.' If the Earl of Essex himself took kindly to the view of the subject here broadly hinted at, all we can say is, that we could not recommend him a more appropriate restorative, after the

toils of his campaign, than that contained in the following recipe, under the head of melilot, or king's-claver: 'The head often washed with the distilled flowers of melilot, is effectual for those that suddenly lose their senses!'

KRASINSKI: A TALE.

I'll take the ghost's word for a thousand pounds.—*Hamlet*.

CHAPTER I.

IN one of my late visits to the continent, I became acquainted with a gentleman whom I will call M. de Rosny. He was first pointed out to me on the promenade as 'the gentleman who was said to have seen a ghost'; but on my thereupon expressing a desire to be introduced to him, I was told that he had the greatest aversion to be questioned on the subject, and, in fact, never had been heard to allude to it.

Being aware that people who have seen, or who believe that they have seen apparitions, are generally characterised by a similar shyness, the natural consequence of the ridicule and incredulity they have to encounter, I was not deterred by this announcement; and accordingly, many days had not elapsed before I had so far attained my object, that I was on speaking terms with M. de Rosny.

He was a good-looking dark man, of about five or six and thirty; gentlemanlike in appearance and manner, rather grave, and decidedly clever. He was by birth a Belgian; and was said to have inherited an ample fortune, together with the title of count, from his father, who, though of an ancient and noble race, had embarked in mercantile affairs, to repair the declining fortunes of the family.

Cautious not to risk success by precipitance, I was in no haste to betray my curiosity. But, one evening, when the conversation accidentally turned on the mysteries of life here and hereafter, I ventured to say, that if one single case of appearance after death were well established, the great question of there being a world to come would be irrefragably settled; adding, that I, for my part, believed there was no scarcity of such evidence, if everybody who had any to produce would speak out upon the subject, and if those who had the courage to do so only met with fair-play.

He entirely coincided. 'But,' said he, 'since anybody who is rash enough to make such an avowal is sure to be treated as a fool or a liar, there is no chance of the question ever receiving the consideration it deserves. Indeed, I think the man is a fool who risks being laughed at by telling people what they are predetermined not to believe.'

Notwithstanding this unpromising beginning, M. de Rosny ended by telling me what I wanted to hear. Not then; for it was evening when we held the above conversation, and he said with a shudder: 'I shouldn't sleep if I speak of it now—I should think I saw again'—

There he stopped; but he agreed to meet me the next morning; and all I can say is, that I am thoroughly convinced that he believed the truth of the following story he then told me.

The wealthy De Rosny, having a desire to see the world, set out on his travels at four-and-twenty. His time was his own; he went where he pleased, stayed in a place till he was tired of it, and partook of all the amusements that came in his way. Amongst the acquaintances formed in his travels was Arthur Edmonds, an Englishman, younger than himself, and was travelling to counteract a tendency to consumption, brought on by too close study at Oxford.

They met several times, and finally at Venice, where they put up at the same hotel—Il Leone

Bianco, on the Grand Canal, near the Rialto. Here they became very intimate; and as their pursuits were the same, and they frequented the same society, they engaged a gondola between them, in which they spent much of their time.

One morning, about a fortnight after their arrival, just as they were stepping into their boat, a gentleman came hastily out of the hotel, and called for a gondola. There happened to be none there at the moment; and as he evinced great impatience, the young men offered him a seat in theirs. He accepted the offer with many thanks, saying that he had an appointment of importance, and was already past his time. They rowed him to his destination; and on parting, he expressed a hope that he might be allowed to return them thanks in person the next day, at the same time handing them his card.

'Count Stanislaus Krasinski,' said De Rosny, reading it.

'And an uncommonly nice fellow,' rejoined Edmonds.

And such he appeared to be; he was tall, handsome, well dressed, polished in his manners, and, though a Pole, spoke French like a Frenchman. They were delighted with their new acquaintance, who soon became their companion in all their pleasures. Indeed, they liked his society so much, that they pressed him to join them in a projected tour to the east; but his great desire, he said, was to see England; and Edmonds promised him an introduction to his family, who were residing at the Lakes—'a country you must visit,' he said, 'as it is one of the lions of England. Our place is in Suffolk; but, unfortunately, my mother can't live there; the climate does not agree with her.'

'If you go there,' said De Rosny, 'you will be falling in love with Edmonds's sister. Elle est très belle; et riche aussi, n'est ce pas, mon cher?'

Arthur replied, that he was perhaps not a fair judge, but he thought she was very pretty, and that, moreover, she would have a very good fortune, as, besides her paternal portion, she had L.20,000 left her by an aunt.

'That aunt was a trump,' added he; 'for she left L.60,000 between three of us; and if either of the three die without issue, his or her portion goes to the survivors.'

Both the young foreigners expressed their admiration of English fortunes; and the Pole remarked, that in his country, ladies were seldom so well provided for; that as for himself, being an only son, he had great landed estates—though not much money, he rejoined laughingly; but that if he had had the misfortune to be born a girl, he would have scarcely had a subsistence.

This agreeable intimacy was at length interrupted by a letter summoning De Rosny to Pisa, where his only sister had been residing some time with her husband. He departed with reluctance, promising to be back in a fortnight; and, as he had a great deal of luggage, he retained his room, giving the key to Edmonds to keep till his return; and reminding him that there was a store of good cigars there, from which he was welcome to help himself.

On his return, after being absent a month instead of a fortnight, he learned with surprise that both Edmonds and the Pole had quitted Venice. The landlord handed him a note from the former, in which he said that he was tired of waiting for him; and that as Krasinski was leaving for England, he should leave too, and go on to Rome, where he hoped De Rosny would rejoin him.

De Rosny now bethought himself of the key of his room, which he had intrusted to Edmonds; but the landlord produced it, saying that it had been found in the door.

'In the door?' said the count.

'Oui, monsieur. Two days ago, I happened to be up stairs, and seeing the key in the door, I took possession of it; but your trunks are there, and I hope you'll find everything safe.'

De Rosny, annoyed at the negligence of Edmonds, who was aware of the value of the property left in his charge, now ascended to his chamber. On opening the door, he saw indeed all his trunks and portmanteaus in their places as he had left them; but a very cursory examination shewed that he had been robbed, and that by a very discerning depredator. His clothes were there, except a few very *recherché* articles of the toilet; but his jewels, his rings, his pins, his diamond snuff-boxes, and other things of that description, which he had collected in the course of his travels, were all gone; as also a bag of gold coins and medals of great value, which he had inherited from his father, and which he was carrying to Rome to the Prince B——, who wished to purchase them.

When the landlord was told what had happened, he expressed the greatest surprise and dismay; and condemned the Signore Inglese very much for not having committed the key to his care. Of course, he could not be answerable for the people of all nations that went up and down those stairs. He was confident none of his servants had committed the theft; and he fixed his suspicions on a stranger, in appearance a Russian, who had lodged there a week, and had gone out one morning, promising to be back to dinner, but had never returned, even to pay his bill.

The annoyance was great, and the loss considerable. The police having in vain used every effort to discover the thief, De Rosny left Venice, disgusted with his own folly and Edmonds's carelessness, and entirely cured of his passion for buying baubles.

He determined now to prosecute his journey to the east; and, being too much out of humour with his English friend to desire him for the companion of his travels, instead of going to Rome, he embarked at Trieste for Corfu. After lingering a little amongst the islands of Ionia, he proceeded to Athens, Constantinople, &c.; and about four months after leaving Venice, he arrived at Beyrout, where he lodged and boarded with a Greek called Simonides. Here he fell violently in love with the daughter of his host, who seemed nothing loath to accept his addresses. Her father, however, thinking no good would come of this attachment, was exceedingly annoyed by it, and endeavoured to get him out of his house; but not immediately succeeding in that object, he set his son, a boy of fourteen, to keep watch upon the lovers in the meantime.

This was the position of affairs, when one night De Rosny suddenly awoke out of a sound sleep, and saw a person, as he thought, sitting in a corner of the room. His instant impression was, that it was the boy Alexis; and he sat up for an instant to assure himself it was not a delusion, before he jumped out of bed to chastise the lad for the impertinent intrusion. But as he rose, the figure rose too, and approached the bed; and then he saw that it was Edmonds, pale and anxious, with a countenance expressive of intense melancholy.

When M. de Rosny came to this point of his story, I eagerly asked him how he felt, and if he was frightened. 'But, perhaps,' I said, 'you thought it was Edmonds himself alive?'

'No,' he said, 'I did not think that; indeed, I believe I did not think at all. I was not frightened; I was paralysed. My sensations were such as, I imagine, people feel under the influence of mesmerism.'

He went on to say, that after an interval, he recovered his faculties; and found himself still sitting up in bed, in perfect darkness. He thought that Edmonds had talked to him; had told him that he had been murdered; that his murderer was the same that

had committed the robbery; and that he, the count, must proceed immediately to England, to convey this information to Edmonds's mother and sister, and thereby prevent a great calamity.

'And were you now convinced that you had really seen a ghost?' I asked.

'Why, at first I was,' he replied; 'but after a little consideration, I persuaded myself that I had been dreaming. In the first place, I had never believed in ghosts; and in the next, I found the room perfectly dark; so that, had a figure been there, I could not have seen it at all, much less distinguished its features. Then I thought it might be some trick of old Simonides and his son to frighten me away—though that could hardly be, unless they had a secret entrance into the room, as I had locked the door. Besides, I did not remember that I had ever told them anything about Edmonds.'

Well, De Rosny proceeded to say, that after some time he sunk into sleep, from which he woke satisfied that he had merely had an unusually vivid dream, such as we all of us occasionally experience. He looked at his tongue, and felt his pulse; reviewed his yesterday's bill of fare; thought he must have eaten something that disagreed with him; or, perhaps, have lately indulged too much in the hookah. In short, he settled himself in the belief that it was a dream; and this conviction was strengthened by there being no repetition of the apparition. Had it been the shade of Edmonds that visited him, of course he would have come again to enforce his request. So he dismissed the subject from his mind, and thought no more of it.

Simonides was in the right. There was no good likely to come to the fair Japhira from her intimacy with the count; for when he saw that she was taking his attentions seriously to heart, not being inclined to fetter himself with a wife, he thought it prudent to leave her for a little. So he made an excursion to Mount Carmel, visited Tyre and Sidon, and other interesting localities, and returned to Beyrout only to prepare for a longer absence from her, this short excursion having convinced him that he could live perfectly well without her.

After a brief period of repose, therefore, he again started, and in the course of his wanderings came to Jerusalem, where, owing to the celebration of some grand festival, he had a great difficulty in procuring a lodging. At length, he found a very poor one in the house of a man called Abime, who lived in the Via Dolorosa; but the man had a sinister eye, and there was something suspicious about his family; inasmuch, that De Rosny warned his servant Stephano to be on his guard, and keep his eyes open and his trunks shut.

Tired with his journey, he went early to bed the first night, and fell into a sound sleep, from which he was awakened by—he knew not what—but he fancied somebody had roused him. He cast his eye round his small room—for he had burned a light ever since his unpleasant dream at Beyrout—but could see no one, though he fancied he heard footsteps. Upon this, he jumped out of bed, and opened his door, which he had both locked and barricaded with a heavy portmanteau. He looked out into the passage, but there was nobody there; and all being quiet again, he returned to bed and tried to settle himself to sleep; but in vain—there still were the footsteps. Again he got out of bed, looked under it, and examined the room more particularly; but finding nothing, he suddenly recollected that his room was at the top of the house, and making up his mind that the noise proceeded from the midnight peregrinations of some marauding cat, he contrived to forget it, and go to sleep. He did not think of this disturbance in the morning; but as it was repeated the two following nights, he

mentioned the circumstance to Stephano, who had heard no such noises, and suggested that they might proceed from rats behind the wainscot. The host was appealed to, who said he had never had such a complaint made to him before, though he admitted that there might be rats on the premises. So the matter rested till night, when the count retired to bed, fatigued, as usual, with the day's sight-seeing; but no sooner had he settled himself to rest, than the noises again startled him from his slumbers. With an exclamation of impatience that sounded very like an oath, he caught up his slipper, that lay by the side of the bed, and hurled it resolutely at the invisible visitant; but he succeeded in hitting nothing except the lamp.

'Sacré!' he exclaimed, and vexed and irritated, he turned his face to the wall, determined, in spite of cats or rats, to go to sleep. 'I'll not pass another night in this cursed hole!' thought he. 'I heard Colonel Everest say he intends to leave to-morrow; and I'll go out early and endeavour to secure his lodging.'

'Who's there?' he cried; for his soliloquy was suddenly interrupted by the pressure of a hand on his shoulder; and turning sharply round, he beheld by his bedside the same figure he had seen at Beyrout. There stood Arthur Edmonds, 'in his habit as he lived,' but with a less melancholy expression of countenance than he had exhibited on his former visitation.

I repeated my question, 'How did you feel?' and he confessed that his first sensation was terror; but that gradually the same paralysation of the faculties stole over him. When he passed out of that state into his normal condition, he was sitting up in bed, no figure visible, and the room quite dark.

He rose, felt for his matches, and tried to light his lamp, but found it had been broken by the blow of the slipper, and the oil spilt. He tried his door, which was fast; felt all about the room, but discovered nothing to explain what had happened; and then he got into bed again to reflect on it.

It appeared to him that he had not only been wide awake when he felt the hand on his shoulder, but that he had not been to sleep at all; and he recollected distinctly what he had been saying to himself at the moment. 'But then,' he said, 'did I fall asleep and dream the rest? Surely it must be so,' he added, rebelling against any other interpretation of the circumstance; 'for why should he come to me? Why not go to his brother himself, and tell him what he wants?' Then he summoned to his recollection what the ghost had said; 'that I ought to have complied with the request made to me at Beyrout; however, that was no longer necessary; but what he now enjoined, he conjured me not to neglect. I am to go to Malta, where I shall find his brother, and then we are to proceed together to Naples, where we shall have this mystery unravelled.'

'How obscure! Why not say what we were to do? But ghost-stories always run in this fashion—ghosts go about things in such an absurd roundabout way, that it is impossible to believe in them. I daresay Edmonds is at this moment alive and well as I am; much better, probably, for I think I must be ill; this climate doesn't agree with me, and the sooner I get back to the west the better. I can go by Malta, certainly; indeed, I should naturally do so; and then I'll go to Sicily—I want to see Sicily; and thence to Rome, and I'll inquire if Edmonds has been there,' &c.; and having made up his mind to this course of proceeding, he went to sleep and slept till morning.

On the following day, he was still less inclined to believe in the ghost; and although, for many reasons, he would have been glad to change his lodging, he

resolved now not to do it, lest it should be, unknown to himself, a weak compliance with his fears; for bravely as he talked, and obstinately as he argued, he confessed that he would not have been sorry to be secured from such dreams in future. 'No,' he said, 'I'll stay where I am for the short time I have to be here; perhaps I may discover the trick, if trick there is;' and when he went to bed that night, he determined to be on the alert and keep all his senses about him: in spite of which laudable resolution, he incontinently fell asleep, and when he opened his eyes, his lamp was burned out, and the broad daylight was glaring into his room.

CHAPTER II.

The succeeding nights of De Rosny's stay at Jerusalem being equally undisturbed, and his days very much occupied, the impression made by his ghostly visitant naturally became fainter and fainter; and when he started on his return to the west, with the intention of taking Malta in his way, he persuaded himself that it was by no means in compliance with the request of his late friend, but that he should have done so under any circumstances, as perhaps he might.

He accomplished his journey without meeting with any extraordinary adventure; but when he sailed into the harbour of Valetta, and saw the boat of the medical officer coming from the Lazaretto to ascertain their state of health, he owned to me that he felt a strange quail of anxiety that convinced him he had not entirely succeeded in arguing himself into a disbelief of the apparition.

'I knew,' said he, 'that Edmonds had a brother in the army; but I had never heard in what regiment he was, and still less where he was quartered; therefore, if I found the regiment to which the young man belonged actually here, and he on duty with it, it would give more colour and probability to the ghost's story than I liked to think of. However, I was not left long in doubt, for almost at the same moment that the Lazaretto boat pushed off from the shore, we observed another from the quay making for our vessel; and in it was seated an officer in uniform—red, with blue facings. Of course, there is always a garrison at Malta; I knew that, and yet my heart beat at the sight of that red coat. I felt myself turn pale; and I stood breathlessly watching the boat as it neared us, and, somehow or other, quite prepared for the question that followed:

'Have you a Mr Edmonds on board?—Mr Arthur Edmonds?'

"No," said the captain.

'All the passengers were clustered at the side, looking over at the boat; and the young officer stood up and reviewed us all—perusing our faces, as if in hopes, notwithstanding the denial, of detecting the one he wished to see; then he reseated himself, and desired to be rowed back.

'It was clear, then, that the regiment in question was here, and I had no doubt of this being the brother: there was a strong family resemblance, extending even to the voice, and quite sufficient to satisfy me of that. I was relieved, however, to find that he was expecting Arthur from the east. If he had been dead so many months, the family must surely have known it ere this. Edmonds had no doubt fulfilled his intention of going to the East, but not having taken the same route as myself, we had never met.

'I kept up my spirits with this supposition during our short quarantine; and the morning after we got ashore, I walked up to the barracks, and inquired for Lieutenant Everard Edmonds—for such was his rank, as I had ascertained by reference to the Army List. I sent in my card, and was immediately admitted.

'I had been rehearsing this meeting in my mind, studying how I should account for my visit, and how

I should avoid incurring the young man's ridicule, in case I found it advisable to disclose the real motive of it, which, however, I had resolved not to do, if I ascertained that Arthur was alive. But I was spared all confusion; for the moment I entered, he advanced eagerly towards me with my card in his hand, and said, after the first salutation and giving me a seat: "What can you tell me of my brother?"

"Nothing," answered I. "I have done myself the honour of calling on you for the express purpose of making inquiries about him."

"His countenance fell; he looked blank. "Nothing?" he repeated—"you don't know where he is? Has he not been travelling with you?"

"No," I answered; "I have been travelling alone. He did talk of going with me to the east; but I fancy he altered his intentions; at least"—

"When did you last see him?" asked he.

'I hesitated a little, and then said: "At Venice—we parted at Venice."

"And you have not seen him since?—you did not meet at Rome or Naples?"

"I did not go to Rome or Naples; I went by Trieste. May I ask if you are also without intelligence?"

"Wholly," he said—"entirely without intelligence. We have never heard a word from Arthur since he left Venice. In his last letter, which I think was dated early in April, he said he was starting for Rome and Naples, at one of which places he expected to meet you, with whom, he had previously told us, he was to travel; and that you were to proceed together to the east. He acknowledged the receipt of some money that he had written for, and desired us not to be uneasy if we did not hear from him, as he should be continually on the move: nor were we for some time. Arthur is a sad idle fellow about writing; and a silence that would be alarming with most people, does not alarm us. But circumstances have happened that render this absence of intelligence unusually perplexing and inconvenient. I daresay you may have seen Count Krasinski with my brother?"

"Certainly," said I; "I knew him very well. When I left Venice, he was there with your brother. He talked of going to England."

"He did go," said the lieutenant; "and took a letter of introduction to my family. He said that Arthur and he left Venice together, and that Arthur was gone to Rome to meet you."

"I have no doubt," I said, "that was his intention; we had originally proposed that route; but your brother left Venice during my absence, and circumstances induced me to alter my plans."

"But you wrote my brother to that effect, I suppose?" said Edmonds.

"Why, no," I replied; "to confess the truth, I did not. I ought to have done so, but I was vexed and angry. When I went away, I left the key of my room in your brother's charge. He thoughtlessly took it in the door; and when I came back, I found some inquiring traveller had been investigating the contents of my trunks, and had relieved me of all my valuables."

"Arthur is dreadfully thoughtless," said the lieutenant.

"I had some famous cigars," continued De Rosny, "to which he had leave to help himself, and, I suppose, he went to get some of these, and forgot to bring away the key. The landlord said he had had a scamp of a Russian there, who went away without paying his bill, and he had little doubt but he was the thief."

"Probably," answered Everard. "But it is very extraordinary that we hear nothing of Arthur!"

'I began to feel,' said De Rosny to me, 'that I ought now to say something about my vision or dream, but I did not know how to begin: on the one hand, expecting that he would take me for a fool or a

madman, and fearing, on the other, that if he gave any credit to the story, he would be dreadfully distressed; so I remained silent, reflecting on what I should do, and I suppose looking very grave, for the young man suddenly laid his hand on my arm, and said: "Pardon me, Monsieur de Rosny, but, from your manner and countenance, I cannot help thinking you know more of my brother than you are willing to own"—I felt myself change colour. "Whatever you know, I beseech you to tell me!"

"But I know nothing!" I replied.

"Then you suspect something—you have heard some report—let me hear it, whatever it is! I, too, have some reason to fear—some cause for anxiety; but I had hoped it was mere fancy—mere nervousness!"

"What," said I, interrupting him, "have you seen him too? Has he also visited you?"

"Who?" said he, looking wildly at me. "What, in Heaven's name, do you mean?"

"You spoke of fancy; you seemed to hint at something that might be mere delusion. I also have had a strange experience—a dream it may be!"

"Relating to my brother?" asked he eagerly.

"Relating to your brother," I replied, now relieved from my difficulty; and on his conjuring me to narrate the particulars, I forthwith proceeded to do so, begging him, however, not to attach any serious importance to the circumstance, unless he should find more conclusive reasons for apprehension.

"He listened to my narrative with the greatest interest; and when I had finished, he confessed, that if I had told him such a story a few weeks earlier, it would probably have been received with the ridicule I feared; but," said he, "a circumstance has occurred to my sister, that seems, unhappily, but too confirmatory of your vision or dream, or whatever it was;" and he then proceeded to acquaint De Rosny with the cause of their alarm.

It appeared that Krasinski, whose intention to visit England had been intimated by Arthur to his mother and sister, duly arrived there, bringing with him a very flattering letter of introduction to the family, who were residing at Ambleside. As he wished to see the country, he took a lodging in the village, and being a very agreeable, accomplished man, was soon a welcome visitor in the best houses there, and to none more welcome than to Mrs Edmonds and her daughter, the fair Emma, who, as her brother had justly said, was an exceedingly pretty girl, with the additional charm of a good fortune. Whether it was her beauty or her fortune, Everard said he did not know—perhaps it was both—but Krasinski had fallen violently in love with her, and had made her proposals which were accepted without reluctance. In fact, the passion appeared to be mutual, and the advantages of the match not inconsiderable. Count Stanislaus Krasinski was a name not unknown, and the family stood high in public esteem. Though he spoke of his large estates as comparatively unprofitable, he appeared to be rich, and his personal qualifications and endowments were undeniable. The title of Countess Stanislaus Krasinski was not unattractive to the young lady, and the great friendship Arthur entertained for the gentleman seemed to render the connection everything that was desirable. Mrs Edmonds wrote to Everard to apprise him of the engagement, and Emma appeared at the summit of happiness; the marriage, she said, was to take place soon, and they were to go to Rome, where Arthur and Krasinski had agreed to meet and pass the winter together. "Fancy," she said, "how astonished and delighted Arthur will be when I am introduced to him as Countess Krasinski, for we cannot write and tell him, since we don't know where he is. We have had no letter since he left Venice. Arthur is a bad correspondent—he always was, and I suppose always will be."

Arthur's negligence being habitual, the family appeared to feel no uneasiness on his account, and everything regarding the marriage advanced most prosperously; the young people walked, and boated, and rode together in the mornings, whilst Krasinski's talent for music and bewitching voice formed the charm of their evening society. Emma esteemed herself the most fortunate of mortals. The prospect of leaving her mother was the only drawback to her felicity; but Krasinski declared himself so much pleased with England, that he had no difficulty in promising to spend much of his time there. The ensuing spring, he said, must be spent in Poland; but he assured Mrs Edmonds that scarcely a year should pass without her receiving a visit from her daughter.

This state of things had lasted several weeks, when a cloud suddenly darkened their sunshine, but whence it came, no one knew. Emma's beaming face paled visibly; her bright eyes grew heavy and dim; her step lost its spring; all day she strolled listlessly about the garden, with her head bowed down, and apparently buried in thought. Mrs Edmonds was silent, but looked anxious and perplexed; and Krasinski, who at first hovered about them, solicitous and assiduous, at length became silent also, and exhibited an air of extreme dissatisfaction. Still there was no word of the marriage being broken off or even postponed, and the period fixed for it was fast approaching. Every one remarked the change, but nobody could obtain a clue to the mystery; and, in fact, as it ultimately appeared, the only person who could have furnished one was Emma, and she seemed to be impenetrable on the subject. Mrs Edmonds wrote to Everard that she had questioned her in vain as to the cause of her depression, which appeared to date from a certain day, on which she and her lover, in the course of their morning excursion, had been witnesses to a very distressing accident; though how this circumstance should have produced such a sinister influence, she was at a loss to conceive.

They were walking on the banks of Windermere, when a beautiful little girl, about six years old, was drowned. The agony of her mother, and her entreaties to Krasinski to save the infant, were most distressing, and doubly so to Emma, since, although she too entreated him, he resisted his first impulse, which was evidently to jump into the water, and suffered the child to perish unaided. Although he excused himself by saying, that the last time he was in the water, he had been seized with cramp, and nearly drowned, Emma did not recover her spirits all the afternoon. Mrs Edmonds thought this quite natural; and Krasinski expected to find her as usual on the following day; but when she appeared at breakfast, they were struck with her altered appearance. She said she had a headache, and had not rested well; but from that day, her health declined, and her whole demeanour changed.

Affairs being in this position, Mrs Edmonds wrote to Everard, requesting him to try if he could extract the secret from his sister. 'Some cause,' she said, 'there must be for so remarkable an alteration; and Krasinski's not having saved the child seems to me a wholly inadequate one.'

Upon this, the young man, who really thought it a pity his sister should lose so good a match for a caprice, sent her a letter, urging her to confide in him if she had anything to tell; and if not, entreating her to throw off this mysterious depression, which must be very displeasing to her lover. 'As for the accident that distressed you,' he said, 'you must remember that men are not always masters of their actions, and we may be incapable of doing at one time what we could do easily at another. The bravest are sometimes seized with a panic; and that you should sacrifice your future happiness, and your lover's too, to an exaggerated sentiment on this subject, would be an

absurdity that would render you perfectly ridiculous in the eyes of the world; and, moreover, it would be an act of unpardonable injustice towards him.'

To these representations, Everard received an answer, which he now put into the hands of De Rosny.

A WOMAN'S THOUGHTS ABOUT WOMEN.

FEMALE HANDICRAFTS.

WHILE planning this paper, I chanced to read, in a late number of the *North British Quarterly*, one headed 'Employment of Women,' which expressed many of my ideas in forms so much clearer and better than any in which I can cast them, that I long hesitated whether it were worth my while to attempt to set them down here at all; but afterwards, seeing that this *Journal* may fall into many hands never laid upon the *Quarterly*, and that these Thoughts aim less at originality than usefulness, I determined in any case to say my say. It matters little when, or how, or by how many, truth is spoken, if only it be truth.

In taking up the question of female handicrafts, in contradistinction to female professions, the first thing that strikes one is the largeness of the subject, and how very little one practically knows about it. Of necessity, the class is a silent class; it lives by its fingers rather than its brains; it cannot put its life into print. Sometimes a poet does this for it, and thrills millions with a *Song of the Shirt*; or a novelist presents us with some imaginary portrait—some *Lettice Arnold*, *Susan Hopley*, or *Ruth*, idealised more or less, it may be, yet sufficiently true to nature to give us a passing interest in our shop-girls, sempstresses, and maid-servants, abstractedly, as a class; but of the individuals, of their modes of existence, feeling, and thought—of their sorrows and pleasures, accomplishments and defects—we 'ladies' of the middle and upper ranks, especially those of us residing in great towns, know essentially nothing.

As I have said, the working-class is the silent class; and this, being a degree above the cottage visitations of Ladies Bountiful, or the legislation of Ten-Hours-Bill Committees in an enlightened British parliament, is the most silent of all. And it includes so many grades—from the West-end milliner, who dresses in silk every day, and is almost (often quite) a 'lady,' down to the wretched lodging-house 'slavey,' who seems to be less a woman than a mere working animal—that, viewing it, one shrinks back in awe of its vastness. What an enormous influence it must unconsciously exercise on society, this dumb multitude, which, behind counters, in work-rooms, garrets, and bazaars, or in service at fashionable, respectable, or barely decent houses, goes toiling, toiling on, from morning till night—often from night till morning—at anything and everything, just for daily bread and honesty!

Now, society recognises this fact—gets up early-closing movements, makes eloquent speeches in lawn sleeves or peers' broadcloth at Hanover Square Rooms, or writes a letter to the *Times*, enlarging on the virtue of ordering court-dresses in time, so that one portion of Queen Victoria's female subjects may not be hurried into disease or death, or worse, in order that another portion may shine out, brilliant and beautiful, at Her Majesty's balls and drawing-rooms. All this is good; but it is only a drop in the bucket—a little oil cast on the top of the stream. The great tide of struggle and suffering flows on just the same; the surface may be slightly troubled, but the undercurrent seems impossible to be changed.

Did I say 'impossible?' No; I do not believe there

is anything under heaven to which we have a right to apply that word.

It seems to me that one of the chief elements of wrong in the class which I have distinguished as handicraftswomen, is the great but invidious distinction drawn between it and that of professional women. Many may repudiate this in theory; yet, practically, I ask lady-mothers, whether they would not rather take for daughters-in-law the poorest governess, the most penniless dependent, than a 'person in business'—milliner, dressmaker, shop-woman, &c.? As for a domestic servant—a cook, or even a lady's-maid—I am afraid a young man's choice of such an one would ruin him for ever in the eyes of respectability.

Respectability—begging her pardon!—is often a great fool. Why should it be less creditable to make good dresses than bad books? In what is it better to be at night a singing servant to an applauding or capriciously contemptuous public, than to wait on the mid public in the daytime from behind the counter of shop or bazaar? I confess, I cannot see the mighty difference; for the question, it must be understood, is not of personal value or endowments, but of external calling.

And here comes in the old warfare, commenced justly in the respect due to mind over matter, head-work over hand-work, but deteriorated by custom into a ridiculous and contemptible tyranny—the battle between professions and trades. I shall not enter into it here. Happily, men are now slowly waking up—women more slowly still—to a perception of the truth, that honour is an intrinsic and not extrinsic possession; that one means of livelihood is not of itself one whit more 'respectable' than another; that credit or discredit can attach in no degree to the work done, but to the manner of doing it, and to the individual who does it.

But, on the other hand, a class that, as a class, lacks honour, has usually, some time or other, fallen short of deserving of it. In the class of handicraftswomen who stand to professional women as ordinary tradesmen to the gentlemen, one often finds great self-assertion and equivalent want of self-respect, painful servility or pitiable impertinence—in short, many of those faults which arise in a transition state of partial education, and uncertain, accidental refinement. Also, since a degree of both refinement and education is necessary to create a standard of moral conscientiousness, I believe this order of women is much more deficient than the one above it in that stern, steady uprightness which constitutes what we call elevation of character. Through the want of pride in their calling, and hence, or a slovenliness of principle in pursuing it, this class is always at war with that above it; which justly complains of the unconquerable faults and deficiencies which make patience the only virtue it can profess towards its inferiors.

How amend this lamentable state of things? How lessen the infinite wrongs, errors, and sufferings of this mass of womanhood, out of which are glared out church-yards, hospitals, prisons, penitentiaries; from which, more than from any other section of society, is taken that pest and anguish of our streets, the

Eighty thousand women in one smile?

Many writers of both sexes are now striving to answer this question; and many others, working more by their lives than their pens, are practically trying to solve the problem. All honour and success attend both workers and writers! Each in their vocation will spur on society to beatify itself, and, by the combination of popular feeling, to achieve in some large form a real, tangible, social good.

But in these Thoughts I would fain address individuals, and stimulate them to action. I want to

speaking, not to society at large, for 'everybody's business' is often 'nobody's business,' as we well know, but to each woman separately, in her personal character as employer or employed.

And, first, to the employer.

I am afraid it is a natural deficiency in the constitution of our sex that we are so hard to be taught justice. It certainly was a mistake to make that admirable virtue a female; and even then the allegorist seems to have found it necessary to bandage her eyes. No; kindness, unselfishness, charity, come to us by nature: but I wish I could see more of my sisters learning and practising what is far more difficult and less attractive—common justice, especially towards one another.

In dealing with men, I think there is little fear that they will take care of themselves. That 'first law of nature,' self-preservation, is—doubtless for wise purposes—imprinted pretty strongly on the mind of the male sex. It is in transactions between women and women that the difficulty lies. Therein—I put the question to the aggregate conscience of us all—is it not, openly or secretly, our chief aim to get the largest possible amount of labour for the smallest possible price?

We do not mean any harm; we are only acting for the best—for our own benefit, and that of those nearest to us; and yet we are committing an act of injustice, the result of which fills slop-sellers' doors with starving sempstresses, and causes unlimited competition among incompetent milliners and dressmakers, while good workers are lamentably scarce and extravagantly dear. Of course! so long as one continually hears ladies say: 'Oh, I got such and such a thing almost for half-price—such a bargain!' or: 'Do you know I have found out such a cheap dressmaker!' I wonder if any of these ever reflected, without a wholesome blush, on the common-sense law of political economy, that neither labour nor material can possibly be got 'cheaply'—that is, below its average acknowledged cost, without *somebody* being cheated. For my part, these devotees to cheapness, when not victims—which they frequently are in the long-run—always seem to me little better than genteel swindlers.

There is another lesser consideration, and yet not small either. Labour, unfairly remunerated, of necessity deteriorates in quality, and thereby lowers the standard of appreciation. Every time I pay a low price for an ill-fitting gown or an ugly tawdry bonnet—cheapness is usually tawdry—I am wronging not merely myself, but my employee, by encouraging careless work and bad taste, and by thus going in direct opposition to a rule from whence springs so much that is eclectic and beautiful in the female character, that 'whatever is worth doing at all is worth doing well.' If, on the contrary, I knowingly pay below its value for really good work, I am, as aforesaid, neither more nor less than a dishonest appropriator of other people's property—a swindler—a thief.

Humiliating as the confession may be, I believe that, on the whole, men are less prone to this petty vice than women. You rarely find a gentleman beating down his tailor, cheapening his hosier, or haggling with his groom over a few shillings of wages. Either his wider experience has enlarged his mind, or he has less time for bargaining, or he will not take the trouble. It is among us, alas! that you see most instances of 'stinginess'—not the noble economy which can and does lessen its personal wants to the narrowest rational limit, but the mean parsimony which tries to satisfy them below cost-price, and consequently always at somebody's expense, except its own. Against this crying sin—none the less a sin because often masked as a virtue, and even corrupted from an original virtue—it becomes our bounden duty, as women, to protest with all our power. More especially,

because it is a temptation peculiar to ourselves; engendered by many a cruel domestic narrowness, many a grinding struggle to 'make ends meet,' such as men, in their grand picturesque pride and heedless magnificence, can rarely either feel or understand.

I do not here advance the argument, usually enforced by experience, that cheapness always comes dearest in the end, and that only a wealthy person can afford to make 'bargains,' because I wish to open the question—and leave it—on the far higher ground of moral justice. The celebrated sentiment of Benjamin Franklin, 'Honesty is the best policy,' always seemed to me a very unchristian mode of inculcating the said virtue.

Another injustice, less patent, but equally harmful, is constantly committed by ladies—namely, the conducting of business relations in an unbusiness-like manner. Carelessness, irregularity, or delay in giving orders—needless absorption of time, which is money—and, above all, want of explicitness and decision, are faults which no one dare complain of in a customer, but yet which result in the most cruel wrong. Perhaps the first quality in an employer is to know her own mind; the second, to be able to state it clearly, so as to avoid the possibility of mistake; and no blunder or irresolution on her part should ever be visited upon the person employed.

There is one injustice which I hardly need refer to, so nearly does it approach to actual crime. Any lady who wilfully postpones payment beyond a reasonable time, or in any careless way prefers her convenience to her duty, her pleasure to her honesty—who for one single day keeps one single person waiting for a debt which at all lies within her power to discharge—is a creature so below the level of true womanhood, that I would rather not speak of her.

And now, as to the class of the employed. It resolves itself into many branches, and, of late years, has started into many off-shoots of occupations, all valuable in their way, such as glass-painting, wood carving and engraving, watch-making, &c., &c.; but the main trunk—the root of women's manual employments—is undoubtedly the use of the needle.

There are few of us amateurs who have not a great reverence for that little dainty tool; such a wonderful brightener and consolator; our weapon of defence against slothfulness, weariness, and sad thoughts; our thrifty helper in poverty, our pleasant friend at all times. From the first 'cobbled-up' doll's frock—the first neat stitching for mother, or hemming of father's pocket-handkerchief—the first bit of sewing shyly done for some one who is to own the hand and all its duties—most of all, the first strange, delicious fairy work, sewed at diligently, in solemn faith and tender love, for the tiny creature yet unknown and unseen—oh! no one but ourselves can tell what the needle is to us women!

With all due respect for brains, I think women cannot be too early taught to respect likewise their own ten fingers.

It is a grand thing to be a good needlewoman, even in what they call across the border 'plain sewing,' and in Scotland, a 'white seam;' and any one who ever tried to make a dress, knows well enough what skill, patience, and ingenuity, nay, a certain kind of genius, is necessary to achieve any good result. Of all persons, the poor dressmaker is the last who ought to be grudged good payment. Instead of depreciating, we should rather try to put into her a sincere following of her art as an art—nay, a pleasant pride in it.

The labour we delight in physics pain;

and I doubt if any branch of labour can be worthily pursued unless the labourer takes an interest in it beyond the mere hire. I know a dressmaker who evidently feels personally aggrieved when I decline to

one that her future lies, spiritually as well as literally, in her own hands.

Seldom, with the commonest shadow of a chance to start with, will a real good worker fail to find employment; seldom, indeed, with diligence, industry, civility and punctuality, will a person of even moderate skill lack customers. Worth of any kind is rare enough in the world for most people to be thankful to get it and keep it too. In these days, the chief difficulty seems to consist, not in the acknowledgment of merit, but the finding of any merit that is worth acknowledging—above all, any merit that has the sense of consistency to acknowledge and have faith in itself, and to trust in its own power of upholding itself steadily in the very stormiest billows of the tempestuous world assured with worthy old Milton, that

But I am pulled down from this Utopia of fancy handicrafts by the distant half-smothered laughter of my two maid-servants, going cheerily to their work through the silent house; and by the recollection that I myself must be up early, as my new sempstress is coming to-morrow. Well, she shall be kindly treated; have plenty of food and drink, light and fire; and though I shall be stern and remorseless as fate respecting the quality of her work, I shall give her plenty of time to do it in. No more will be expected from her than her capabilities seem to allow and her work promised; still, there will be no hating an inch of it; it would be unfair both to herself and me. Is that the very reason I took her was from her honest and downright sayings. 'Ma'am, if you can't wait, I know anybody better, don't employ me; but, ma'am, when I say I'll come, I always do.'—(P.S. I didn't!!)

Honest woman! If she turns out fairly, so much better for us both, in the future, as to gown and crown-pieces. If she does not, I shall at least have the satisfaction of having done unto her as, in my place, I would like others to do unto me—which axiom expresses and includes all I have been wise on this subject.

AN EARLY WORKER AT THE ROCKS

In 1798, there appeared at Glasgow a respectable looking octavo volume, entitled *The History of Ruglen and East Kilbride*. The title bore that the book was 'published with a view to promote the study of antiquity and natural history.' It is now a scarce volume, and few know anything about it. The district to which it refers is part of that coal and iron field which now pours into the city of Glasgow a stream of wealth. In 1798, no one dreamed of natural richness; iron-smelting was either not practised at all, or only on the most trifling scale; and researches of modern geology were yet wholly in the future. Yet this volume contains correct and valuable accounts of the minerals of the district, as well as of the fossils found in the carboniferous strata. The exact representations in copper-plates of the fossils being, it is believed, the earliest efforts to depict these objects. You may here see the *Seta*, *lepidodendra*, *sigillaria*, and forms of the *Trilobites* as correctly delineated as in any recent geological treatise. The corals, encrinetes, univalves, and other of the formation are presented in great variety, and correctly named according to the nomenclature of the day, which, however, is considerably different from that now in vogue. There are also traces of fishes, all set down as teeth by the author.

'In all labour there is profit'—ay, and honour too, if the toilers could but recognise it; if the large talk now current about 'the dignity of labour' could only be reduced to practice; if, to begin at the beginning, we each could but persuade the handful of young persons immediately around us and under our influence, that to make an elegant dress or pretty bonnet—nay, even to cook a good dinner, or take pride in a neatly kept house, is a right creditable, womanly thing in itself, quite distinct from the profit accruing from it. Also, since hope is the mainspring of excellence, as well as happiness, in any calling, let it be impressed on every

what appears to be a scale of a holoptychius, described in the letter-press as a fragment of a crustaceous animal. Making allowance for a few misapprehensions, unavoidable in the then obscure state of the science, the chapters on the fossils are marvels of intelligence. The author had the sense and the courage to dismiss the old notion as to fossils—namely, that they were stones of a peculiar kind produced as *lusus nature* ('sports of nature'). 'It is evident,' he says, 'on the slightest attention, that these bodies possessed organization and life, in the same manner that shell-fish and other marine productions do at present. It is almost certain, that most of them lived and died in the places where now found; and that these places were once covered with sea.' These views are precisely those of geologists of the present day. Altogether, this *History of Rutherglen and East Kilbride* is a marvel of insight into certain things then considerably out of the way of ordinary mortals.

And who was the author? His name and position in life are given on the title-page—'David Ure, A.M., preacher of the gospel.' We find that this name has no place in any biographical dictionary, and has never been referred to in the history of geological science. Strange—but perhaps to be accounted for by the local nature of the book, and the modesty and early death of its author. When we inquire into Ure's history, we find that he was in various respects a highly interesting person.

He was the son of a working-weaver in Glasgow, and was trained to his father's trade. Left in boyhood with the charge of a widowed mother, he not only worked for her support and his own, but contrived, in intervals of labour, to gratify the insatiable thirst for knowledge with which nature had inspired him. It will appear more of a wonder to an English than a Scottish reader, that this weaver lad every day cast aside his apron to attend the Latin classes in the High School, and afterwards those of the university, in his native city. Dr Moor, a Greek professor of some celebrity, who was somewhat ungracefully addicted to doggerel rhyming, but was a good-hearted and worthy man, regarded his weaver-pupil with the respect due to his extraordinary diligence and manifest abilities. After scolding other youths for negligence, he would make a bow to David, and say:

David Ure,

He sits secure,

He'll ne'er be fined by Dr Moor.

The young man usually worked at his loom for the greater part of the night; but while his hands were throwing the shuttle, his eye would be intent on the pages of Virgil or Homer laid open on the beam by his side. Antiquities and natural curiosities of all kinds early excited an interest in David's mind. On one occasion, while at college, being informed of something worthy of his notice on the top of Ben Lomond, he took advantage of the Christmas holidays to make a pilgrimage thither, notwithstanding that the ground was covered with snow. The fancies that beset the scientific mind at the dawn of philosophy struck a chord in the active brain of David Ure. He thought of discovering the perpetual motion and philosopher's stone. But here the facetious Greek professor gave him a hint, which instantly righted his mind. 'David,' said he, 'we have got a sufficient perpetual motion in you; and industry and perseverance are the true philosopher's stone, because, though they should not produce gold, they will produce what can be exchanged for gold.'

The subsequent career of David Ure was very much like that of the run of Scottish students in humble

life. He advanced from the loom to be assistant to the schoolmaster of Stewarston, in Ayrshire—and from thence to be the master of a 'subscription school' in the neighbourhood of Dumbarton. During this course of exertion, he was pursuing the studies required for a pulpit in the Scotch church. When at length licensed as a preacher, he was appointed assistant to the Rev. Mr Connel, minister of East Kilbride—that is, he undertook the pastoral duties for which that clergyman was unfitted by age or bad health—at a salary of ten pounds a year, besides his maintenance! willing, no doubt, to work at this low rate for some years, in the hope of at last succeeding to the salary of his principal. His frugality in these years may be judged of from the fact, that out of the ten pounds he continued to relieve, if not wholly to support, his aged mother. While performing the whole round of parochial duty, of which the composition of two sermons a week would unavoidably form a part, Mr Ure studied the ancient history and mineralogy of the district, making, it is said, some discoveries from which great practical benefits were afterwards derived; and it was then that he composed the work for which his name deserves to be held in remembrance.

The habits of David as an observer are fully described by one who seems to have known him intimately. 'Whether travelling to gratify his curiosity, or to execute any commission, it was always on foot. Though short of stature, he was of a vigorous structure of body, and blessed with a sound constitution. He often carried bread and cheese in his pocket, and enjoyed his repast beside the cooling spring. When his circumstances would afford it, he would repair to the village alehouse and enjoy his favourite luxury, a glass of ale. His greatcoat was furnished with a large pocket, in which he stowed such minerals or other objects as had attracted his notice. He carried a tin-box for stowing curious plants; a large cudgel armed with steel, so as to serve both as a spade and a pickaxe; a few small chisels and other tools; a blow-pipe with its appurtenances; a small liquid chemical apparatus; optical instruments, &c.; so that his friends used to call him a walking shop or laboratory. In this way he braved all weathers; and heat and cold, wet or dry, seemed equally indifferent to him. He was a patient observer and accurate describer of nature. *His descriptions were always taken down on the spot*, in a species of short-hand invented by himself, and which, it is to be regretted, no one but himself understood.'

It is pleasant to learn of one whose intellect calls for so much respect, that he was simple, sincere, and unworldly, of a cheerful affectionate disposition, and almost incapable of being made angry. His extreme good-nature prompted his friends to lay plots for incensing him, if it were possible, by stories concerning ridiculous mistakes which they alleged he had committed, or laughable situations into which he had been brought. But these little tricks invariably failed. David would laugh as heartily at the fiction as any, or, if it had any foundation in fact, he would affect to correct it; thus in general greatly heightening the merriment of the company.

We fear it was David's fate to spend a good many years in the situation of an assistant-pastor. There is a want of dates for his history; but as Dr Moor ceased to teach the Greek class at Glasgow College in 1774, and Mr Connel died in 1790, we may presume that David was not much less than ten years at work on his ten-pound salary in East Kilbride. The patronage was in the crown, and he had been promised the succession. But when the vacancy took place, some perverse influence—it is said from a female quarter—caused the charge to be given to another, to the great disappointment of the parishioners, most of whom in consequence seceded and joined a dissenting body. David, with his characteristic generosity, no sooner

heard he was to be disappointed, than he left the parish, in order that he might not stand in the way of a 'harmonious settlement' for the presentee. Taking his pronged staff in his hand, he set out on foot for Newcastle, and there undertook the duty of assistant-preacher in a presbyterian chapel.

The publication of his book in 1798 recommended him to the attention of the benevolent patriot, Sir John Sinclair, as one who could give material assistance in the compilation of that remarkable work, the *Statistical Account of Scotland*. He was one of the three talented young men whom Sir John for some time employed as his assistants in this task, each of whom, as we have heard from one of them, received a hundred a year of salary. In the case of certain parishes, where, from the senility of the minister or other causes, an account was not furnished, David Ure supplied the deficiency. He also prepared the indices for the work. While thus toiling under the eye of good Sir John, he became favourably known to the Earl of Buchan, who, with all his childish vanity, was not without some generous impulses. The parish of Uphall, in his lordship's patronage, becoming vacant in 1798, David Ure was selected for the charge, thus at length attaining the summit of his professional ambition, and being placed in comfort for life. Sad, however, to tell, he had not enjoyed his preferment above two years, when he was cut off by dropsy. The first delineator of Scottish fossils lies in Uphall church-yard, under a stone which his friend the Earl of Buchan raised and inscribed as follows: 'D. Ure, A.M., in hac ecclesiâ rite repositus, morbo acerbò Hydrop. diu vexat. animam denique refavit, et Deo reddidit, die Martii xxviii., A.D. MDCCXCviii., et hic sepult. fuit. H.M. David, Buchanæ Comes, in test. amic., I.T. F.C. Pulvis et umbra Sumus.*'

BUSINESS IN EGYPT.

HAVING business to transact with the *nazir* or director of the customs at Alexandria, relative to a ship which had to be cleared out that day, the captain and myself, one hot morning in August, bestrode our respective donkeys, and cantered away towards the sea-side, where the custom-house is situated. Not a breath of air was stirring, whilst the sand and the houses reflected the most intense heat; even donkey-boys had deserted their positions; and rabid-looking, half-starved dogs dug up unseemly smells from dirt-heaps—so abundant in Egypt—in search of some sheltered and cooler retreat.

Galloping through the Turkish street, or main thoroughfare, which leads to the Mahmoudiah Canal, we turned abruptly to the left, and entered a dirty little alley, barely two yards wide. Here, however, we were protected from the sun; but, at best, it was a sad alternative; for other evils existed, which threatened cholera in lieu of a *coup de soleil*. The streets, in fact, were a general sewer, whence arose a pestilential vapour. Children in cool attire puddled by the side of these cesspools, making mud-cakes, and wholly unconscious of any inconvenience from swarms of flies on all parts of the face and body. Imagine, too, an occasional half-putrid cat, the skeleton of a dog or two, scores of rats killed during the night, and thrown out by ancient duennas; some rinds of water-melons, and half-starved poultry earning a filthy liveli-

hood; and, huddling all these together, you shall have a perfect and unexaggerated picture of the by-streets of Alexandria in this present year of grace. Through these streets, the captain and I scampered as fast as our donkeys and the pathway would admit of; now and then we emerged into little open squares, where stood extemporaneous coffee-houses, formed of long poles, stuck in the earth, and covered over with mats and old canvas sails; where, further, the atmosphere was darkened with flies, allured by the fruits and sweetmeats exposed for sale by some half-dozen liberated negroes; and indolent old fellows lolled on wooden benches, smoking, playing at backgammon, and sipping hot coffee or glasses of cold sherbet. Now we came into a narrow tortuous street, full of heavily laden donkeys, water-carriers, and Egyptian damsels doing up each other's hair, and investigating horrible secrets as they proceeded. The last turning was the worst of all; for we had to pass through an ordinary-sized street-door into an equally circumscribed passage—short-cut, and provided with a well besides, which made the crowd the denser. At last we got out, and emerged upon the open beach. Immediately to our left was the cumbrous old building we were in search of; but to get at the entrance-gate without suffering bodily injury, was no easy matter. The whole space from the landing-jetty right up to the walls of the custom-house, was literally crammed with goods, carts, donkeys, porters, boatmen, mules, merchants, horses, and one or two European carriages belonging to the officials. Now and then a long string of gawky camels would come picking their way over bale-goods and bars of iron, and, amidst the babel that reigned around some sudden gust of wind would lift up a cloud of sea-sand, nearly blinding the unwary, and effectually stopping for a while the hooting, screaming, and swearing, of the busy multitude here assembled.

In a hut, about the size of a common turn-up bedstead, sat two officers of excise, black as Egypt's soil could make them, and as open to bribery as any officers of excise in the world. Handing these a piastre or two, and recommending our donkeys to their care, we prepared for the assault. No Bedan ever presented more obstacles than we here found, in bales piled loosely one above the other, with intervening gaps filled up with iron bars, broken hoops, baskets of rice, and all imaginable odds and ends. Sometimes, just as we had scaled a perfect mountain of cotton, the upper bulk would topple over, and send us floundering amongst broken zembils (straw bags) of rice. But it was not only these impediments we had to contend against; boatmen, crouching like spiders on the look-out for unwary prey, would dart out from behind a pile of Manchester goods, and insist upon hurrying us off to vessels in the harbour; donkey-boys were equally desirous of securing our custom; and, besides these, were atlases of porters, tottering under weights sufficient to crush any ordinary beings, and which imparted such momentum to their movements, that it was physically impossible to stop one of them, until he had jerked the burden off his back, or some accidental encounter threw man and weight violently to the ground. There were, moreover, a large class of idlers (*hamals*), who worked exclusively within the building, and who, guessing the purport of our visit, undertook to a man, to see the ship cleared out in something less than the twinkling of an eye, for the usual *buckishish*.

The captain engaged one of these porters to pilot us through the bewildering maze and confusion around; and the first place he took us to was a long narrow room, to the right hand of the chief entrance-gate;

* The principal facts of this memoir are obtained from an article signed J. Hendrick, in the *Scotts Magazine* for December 1808. Mr Hendrick, if we mistake not, was one of the three assistants of Sir John Sinclair, and author of the *Report on the Island of Arran*. Edin., 1807.

on the very threshold of which despair seized upon us at sight of the vast number of applicants and expectants standing about. In the room itself there was nothing to give one an idea of pressing business and excitement. *Staffer Allah!* God forbid! that any one should seem hot and hurried in these burning climes. 'There's a time for everything,' was the motto of the head-clerk in this department; a worthy old Armenian, with a pinched-up face and meagre person—'A time for everything,' as he quietly displaced his huge spectacles from off his very prominent nose, for the better enjoyment of a good pinch of snuff—the only earthly enjoyment he ever indulged in; then, having methodically pulled out and opened an enormous pocket handkerchief, he violently applied it to its use; and folding it up as leisurely, replaced it in a capacious pocket; drawing out thence, the better to make room for it, a tobacco-pouch, half-a-dozen rusty old keys, a dirty bit of dried cream-cheese, which was to serve for his lunch, a rosary and cross, and a pocket tooth-comb—the latter being used exclusively for the dressing of his beard. Sarkies Oynl was more innocent of hair on his head than a newborn babe—of which we had proof, for the heat of the weather induced him to lay even his skull-cap aside. We stated our business in a few words to this functionary, handing him at the same time the requisite certificate from the ship's brokers, as to the precise amount of grain shipped. The Armenian took the paper, and, being ignorant of European characters, sent it by a trusty hand to some learned *turghiman* (interpreter), who lived hard by, requesting that he would translate and write down in Turkish the sum-total of the figures. This done, he begged us to be seated, and opening a musty old desk in front of him, drew out some bread, a couple of cucumbers, a paper of mixed salt and pepper, an onion, and a small piece of garlic. These, with the cheese already alluded to, constituted his mid-day meal; and yet this man was reputed to be worth some thousands of pounds sterling. While waiting the return of the messenger, we had ample opportunity of surveying the apartment and its other inmates. Save the door of entrance, there was not even a pigeon-hole window or other inlet for light and outlet for nauseous gases. A low divan ran round three sides of the room, and on it were seated, at intervals of a yard, some eight or ten minor officials, all of whom had vast heaps of papers and piles of books on their respective desks; all were sitting cross-legged, and not one was paying the slightest attention to the business of the day. Some played at backgammon, others were shuffling dirty packs of cards, while the remainder were either smoking, eating, or relating anecdotes *sotto voce*. Every now and then, some enraged Jew-broker, whose patience was fairly worn out, would jostle his way into the room, and beg to be informed whether his business was to be settled that day or not.

'Shuay, shuay, ya Ebni!' drawled out the Armenian, with his most nasal twang; 'gently, my son. Do you take us for asses, or the sons of cows, that you come here to heap dirt upon our beards? Is not the sun hot to-day, and the want of wind oppressive? Do you suppose we are giants? Mashallah! look here,' taking up an armful of papers—'did Solomon ever have so much difficult reckoning, or Job so many trials of temper to contend against? Mashallah!'—growing more vehement and loud—'one would think the pasha—may Allah widen his shadow!—was your uncle or your grandfather, you make so much noise. Haidey, get out of this, and wait till we send for you, unless you wish an ass to sit on your father's grave;' and then the old fellow would wind up with a tirade of abuse, the minor fry joining in chorus, till the discomfited Jew beat a hasty retreat, and the Armenian, sticking on his spectacles, looked over them at us, as

though for approbation, stroking down his beard the while, and uttering over and over again: 'Adjibee!'—that is, wonderful! incredible! the idea of such a ruffian bearding us in our own den!

After half-an-hour's absence, the messenger returned with the paper in his hand, and the information that the *turghiman* was nowhere to be found; upon which the custom-house clerk coolly informed us that the captain had better call again next day: no, not next day, for that was Sunday, but on Monday morning. The *turghiman* would be warned to attend, and such a trifling delay would give the captain an opportunity of amusing himself by going into the country to *shum il Howah*—that is, literally, smell the wind, or for change of air. Moreover, he suggested that by that time a fair wind would set in, and everything would go on comfortably and pleasantly. Satisfied in his own mind at the result he had arrived at, the Armenian filled his pipe, and was in the very act of lighting it, when he and the rest of the officials were perfectly electrified by what they at first considered a sudden fit of lunacy on the part of the English skipper. No sooner had this bluff, honest-hearted fellow been put in possession of the intentions of the custom-house, than starting up into the middle of the room, and flinging his straw-hat violently on the floor, he approached the terrified officials, one arm akimbo, and shaking the hand of the other in a most alarming manner.

'Look 'ee here,' roared the captain, as though he were hailing a man half a mile away, 'by the pipe that played before Moses, you'll not smoke again in this world until my vessel's cleared out and done with.'

Whereupon he snatched the pipe from the terrified nazir, and flung it to the opposite side of the room. Then ensued a scene that baffles description. The spectators were convulsed with laughter, the officials wavering between wrath and excessive fear.

'What does he say?—what does he mean?' tremblingly inquired the Armenian. After the captain's menace was duly interpreted, an appeal was proposed to the great man of the establishment—the Bey Effendi, whose apartments were at the opposite extremity of the edifice. Thither we litigants accordingly repaired, followed by a clamorous rabble; some of whom sided with the authorities, whilst by far the greater portion, from selfish motives, upheld our cause. On arriving at the bey's room, a servant gave us to understand that his master could not then be disturbed, being engaged in his noonday devotions. The captain was for forcing an entrance, whereat the natives immediately set him down as a decided lunatic. After a short parley, the Armenian was at length convinced that, if we stated the amount of grain shipped, in *Arabic*, and if he found our statement tallied with his own account, there could not be any great danger of his compromising either himself or his employers. Unwillingly, and threatening dire retribution for the insult offered him, he led the way back to his own office; and there, after handing us back our document, produced his own shipping-book, where, in characters strangely resembling the imprints of a spider's feet, he had day by day entered the shippers' names and the amount shipped. We stated our estimate of the sum-total at so many *ardeb*s of wheat. Then was the mathematical genius of the whole posse of clerks called into requisition to accomplish the necessary addition. The vessel had been ten days loading, and had received so many boats, each containing so many *ardeb*s per diem. The boat's notes, and the permits to ship, guaranteed this fact, so that it was next to impossible that an error could exist. Nevertheless, it occupied these learned pundits a full hour of groaning and calculation before the required result was obtained. At last three of them, amidst the murmured plaudits of the Arab idlers hanging about the door, accomplished the feat, and then it

was satisfactorily ascertained that the reckonings tallied to a measure. Then, and only then, did our Armenian friend recover his dignity and composure, when, pulling out a scrap of paper not more than two inches square, he cocked up one knee, which served as a writing-desk, and reed-pen in hand, wrote off leisurely and quietly the few necessary words of the certificate: this done, he sprinkled it carefully with fine sea-sand; and then the certificate was passed from hand to hand, to make sure that no error existed in the ciphering. Satisfied on this point, the nazir divested himself of his *khatem* (ring of office); dipping the forefinger of his right hand into his inkhorn, he smeared the seal over; and then first wetting the paper with his tongue, struck the impression, and handed us the document, without which no consul is justified in clearing out a vessel, and no vessel can, under any pretence, obtain a pilot to guide her out of the harbour.

But our work was not yet finished; the Bey Effendi had to countersign this passport; and although he had long since finished his prayers, he was then indulging in his afternoon siesta—having first threatened to flay his slave alive if he dared permit any one to interrupt the nap. Our friend the captain, however, made noise enough outside the door to awaken even the seven sleepers; so, after much ineffectual resistance, the bey himself came to the door, inkhorn in hand, and there and then affixed the necessary signet, telling the captain, as he handed him back the paper, that he prayed Allah never to let him hear his voice again in that building; so the captain strolled over to the harbour-master's, and, paying the requisite fee, soon got the necessary clearance, and was far out at sea by sundown. Had he not violently resisted, he might have lost a whole week or more, and perhaps have missed the opportunity of making a good passage home. But such thoughts never trouble an oriental; with him, to-day or to-morrow is all one—to go or not to go amounts to the same thing. If it is destined by Allah to happen, it will happen; and if not, it is worse than useless troubling one's self about the matter.

It is the same all over the Turkish possessions—in Syria, Egypt, Asia Minor, or Turkey in Europe; nothing can exceed the annoying and vexatious ignorance and obstinacy of the eastern people.

Sometimes whole cargoes of furniture and crockery were imported for the use of private families residing in the East; and these were at once warehoused in the custom-house until the vessel that brought them had finished discharging the whole cargo. Meanwhile, other ships also were disgorging goods of all descriptions, and as there was no method—no system adopted in the warehouses—the result may be more readily conceived than described. Boxes of fragile goods were recklessly bundled into the most convenient corner, and piled over with heavy iron machinery or equally heavy packages of furniture; so that the hapless proprietors, after weeks of fatiguing and fruitless search, ultimately deciphered their private marks or addresses upon some dust-be smeared portions of deal-board, carefully crushed, and containing the pulverised remains of a once costly set of China.

It was no easy matter to impress upon these Egyptians the size or description of the goods one chanced to be in search of. Like all orientals, after listening to the first few words of explanation, they would jump to immediate conclusions, and disappearing in the chaos, return with some box or parcel as different from that you were in search of as the light of day from the darkness of their own minds. All musical instruments, for instance, are recognised under the term *nobe* (Arabic, music). A lady was once in search of a semi-grand piano which had been swallowed up by the custom-house some three months prior to her arrival from England; as soon as the

Arab hamal heard the word 'nobe,' he paid not the slightest attention to the rest of the description which indicated its great size and exceeding weight, &c.; he at once mentally plunged into the dark recesses of his memory, and fished up these facts, which, in his own opinion, were highly satisfactory—namely, that nobe meant a musical instrument, and must consequently be either a drum or a fiddle, a guitar, fife, or psaltery. These comprised the width and length of his acquaintance with musical instruments; so he at once clambered out of sight, and after a tedious absence, returned in high glee for his expected reward. He had brought with him a traveller's leather hat-box, under the firm conviction that it contained a small drum!

I shall never forget the rage of the customs' people at Beyrout, when one immensely heavy deal-case, the property of a learned German naturalist, fell into their clutches, and was forced open, despite the frantic explanations, promises, threats, and gesticulations of the travelled savant. The more fuss the doctor made, the more the officials were convinced that they were about to have a splendid haul of smuggled silks and other costly goods. A large mob had collected round the place, and the suspense and curiosity were intense. Presently the lid yielded, and the first thing that met their astonished gaze was a lot of saw-dust, with a camel's skull carefully packed in the centre. This, however, was supposed to be a mere blind; empty baskets were produced, and the naturalist, to his great discomfort, saw the packing, which had cost him so much care and labour, shovelled up and thrown into old baskets, with little respect to the fragile contents. No sooner had the skull been removed than they came upon a small stuffed alligator, then a few specimens of fish, some petrified olives and other matter, and lastly, they disinterred a whole row of large well-stoppered glass bottles. This, then, must be the treasure—must contain costly pearls or scammony, or some taxable drug. The head of the custom-house, who had been personally attracted to the spot by the rumour reaching him of the apprehension of a noted smuggler, now took upon himself the duty of investigation, as much from intense curiosity as from a suspicion of his not over-honest confrères, who might slip anything very costly unperceived into their capacious sleeves. The first bottle he hauled out he held up to the light, and very nearly dropped with a combination of emotions difficult to conceive—it contained a large snake in the act of swallowing a frog, carefully preserved in spirits. The next bottle contained a scorpion; the third, some lizards; the fourth, centipedes; the fifth, bats; and so on, until every bottle had been displaced. Then there arose a shout of laughter, mingled with exclamations of unfeigned surprise. The custom-house officers were completely nonplussed; the nazir himself, a very superstitious man, terribly alarmed. He set down the doctor immediately as some evil-disposed person who could wither up the health-springs of one's blood at a single glance. Calling away his people, he hurried off to his office, murmuring verses of the Koran; and not a soul amongst the natives would lend a hand in helping the doctor to repack his much-valued collection. What a human being could want with such abominable things was an unsolvable enigma to the whole town and neighbourhood.

I know of only one parallel incident to the foregoing, which inflicted a terrible shock not only upon the authorities, but upon the whole population of a province in European Turkey. The case was this. An eccentric Polish physician, who had been travelling in the East, was returning into his own country, and undergoing the term of his quarantine at, if I remember right, Orsova. When the authorities came to examine and purify his luggage, they found, amongst other things,

a very small phial, carefully corked and sealed, packed in a small box, and stowed away at the very bottom of his portmanteau. On inquiring what the contents were, judge of the horror and consternation of the officials on being very coolly informed that it was matter from the pustules of a plague-infected patient in Egypt, which the doctor was carrying to his own country to experimentalise with in inoculation. Strange as this may seem, it is nevertheless a fact; and I believe the Turks were for some time undecided as to the propriety of burying the doctor alive in the same deep pit full of quicklime in which his plague-materials were carefully deposited.

A WORD FROM NUMBER THREE.

You see there's myself and two more on us as clubs for takin' in *Chambers's Journal* among us; and we lends it to one another like; and so I see what was wrote the other day about the railway travellin',* and as how low fellers like huz isn't pleasant to be rode along side on in the same vehicle as your second-class gentles. That may be all very true; but if every man as has cause has a right to complain, the gentlman as wrote that there won't have it all his own way.

Why, in coorse, it ain't agreeable for folks as wears fine clothes, and allus goes out dressed slap-up like, when they has a bit of travellin' to do, to ride along with poor fellers like huz, that's maybe agoin' out in a workin' sort of way, or hain't got the toggery all right, even if we had the time to spare for putting it on. And then when we do go out a bit from home, it comes natral that we should make ourselves merry and comfortable-like, more especially if we meets a friend, which it's the occasion of many a feller being the worse for liquor when he's out on sich occasions. And so, as I was sayin', we workin' men don't feel it agreeable nouthar to be forced to ride in those ere second-class vehicles; we're better pleased when we have all our own equals about huz; and if we're not exactly quite the thing for cleanliness—or if we're in stakin' a little, too much refreshment—or if we wants to pass away the time by singin' a stave of a song with chorus all round, or the like of that, why, you see, when we're all together among our own sort, we feels quite at home and sociable, as I may say. We're all uzed to it, you see, and 'abit is a second natur.

Well, I suspects that the gentlman as wrote that article, must be the same as I come upon one night omnin' up from Hexeter to Bridgewater, and I'm jist going to tell you all about it.

There was Bill and his two cousins, as is all Hexeter men, as well as myself; and his two cousins, which had been to sea in Her Majesty's ship, the *Dolking*, come into Plymouth, and got leave to spend a few days with their parients at Hexeter. Well, Bill axes me to go down with him for a day, which his uncle had avited him to do, sayin' I should be welcome; so we went down parliamentary, quite comfortable; which the old man gave us very good eatin' and drinkin', and we spent the day very pleasant altogether. In coorse, we did not choose to go away home before night, we found he company so agreeable; and we was goin' when we got some refreshment at the pubic-house near the station; indeed, to say the truth, Bill, as the sailors said, freshened his nip a little too much; and that's a fact. We was all royal, but Bill was so bad that we had a great tado to get him into the carriage at all. As there

was no third-class by the mail-train, we was forced to get second-class tickets; and, as I was sayin', I thought it lucky there was no one in the same but ourselves. Well, just as the train was movin', a gentlman and lady comes runnin' up post haste, and bundles right on end into the carriage where Bill and me was, which I was not pleased to see it. Well, Bill got himself to sleep very soon; and I hoped all would be quiet—and a sleepin' man generally don't quarrel much—but all of a sudden, he begins choppin' his teeth in his sleep, and snorin' like, and then he kicks out with his hobnailed high-lows most furious; and that's the truth on it; and I can tell you that if he had took a feller on the flat of the shin-bone with one of those there kicks, it wouldn't have been no joke.

Well, I have said that I suspects this here gentlman was the same which made sich a complaint to *Chambers's Journal*; and I know he sat nearly opposite to Bill at the time, and looked frightened out of seven years' growth, for several of Bill's kicks—and they was kicks, and no mistake—passed right and left at each side of his legs, before he could make his escape to the tother side of the carriage, away near where the lady was sittin'; which I must say that same lady looked to me as if she wanted more to laugh nor to cry at that particular moment. Howsaever, it was no use tryin' to wake up Bill; and so he snored, and chopped, and kicked like winkin' all the way to Bridgewater; but as he had it all to himself, he hurt nobody but the carriage. When we come to Bridgewater, the gentlman got out, and made no end of row, and insisted on huz drunken fellers, as he called huz, being put out; which I told him we were quite agreeable, seein' as how we didn't want to go no farther. And now I say, if that the gentlman says was done—that is, that we third-class people should have a carriage for ourselves with every train—we should not be troublesome to people as thinks they be our betters. I suppose, by his writin' so sharp, he is either a lawyer or a member of parliment; and so let him make a law to procure us the haccommodation which we naturally require. It is not fair at all to make us pay a good splice more for goin' at one hour than at another, and only a board to sit on either way, which I'll do the gentlman the justice to say that he has stated the fact in that respect quite correct and proper. He's a little hard on us poor workin' fellers; but what he says is true, we would not come in his way if we could help it; and I hope the directors of railways will take his advice, which it would be better and more agreeable for all parties.

BOB.

TRADITIONARY MEDICINE OF THE HIGHLANDS OF SCOTLAND.

PENNANT, in his *Tour in Scotland* (1772), gives some details of the popular medical practice of the Highlands before the days of educated physicians. In connection with the article in our present number, entitled 'The Vagaries of Physic,' we have thought it worth while to reproduce these details in a condensed form. It is highly worthy of remark, that the Highland therapeutics are, on the whole, considerably more rational than some medical systems of the learned in past ages.

Fevers and colds were the principal diseases; of the former, ague was of recent introduction. What was done in cases of fever we are not told. 'Common colds were cured by *brochan* or water-gruel, sweetened with honey; or by a dose of butter and honey melted in spirits, and administered as hot as possible. Adult persons freed themselves from colds, in the dead of winter, by plunging into the river—immediately going to bed under a load of clothes, and sweating away the complaint.' This, it may be remarked, comes nearly to the same point as modern hydropathy. 'Warm cow's milk in the morning, or two parts milk and one of water, a little treacle and vinegar made into whey, and drunk warm, freed the

* See article, Poor Number Two! in No. 174.

Highlander from an inveterate cough. The chincough was cured by a decoction of apples and of the mountain-ash, sweetened with brown sugar. Consumptions and all disorders of the liver found a simple remedy in drinking of butter-milk. Stale urine and bran made very hot, and applied to the part, freed the rheumatic from his excruciating pains. Fluxes were cured by the use of meadow sweet or jelly of bilberry, or a poultice of flour and suet; or new-churned butter; or strong cream and fresh suet boiled, and drunk plentifully morning and evening. Formerly the wild carrot boiled, at present the garden carrot, proved a relief in cancerous or ulcerous cases. Even the faculty admit the salutary effect of the carrot poultice in sweetening the intolerable fetor of the cancer, a property till lately neglected or unknown. . . . Persons affected with the *scrofula* imagined they found benefit by exposing the part every day to a stream of cold water. Flowers of daisies, and narrow and broad-leaved plantain, were thought to be remedies for the *ophthalmia*. Scabious root or the bark of ash-tree burnt was administered for the toothache. The water ranunculus is used instead of the cantharides to raise blisters.

A peculiar disorder called *Glacach*, attended by tightness and fulness of the chest, and frequent in the beginning of consumption, was also called the *Macdonalds' Disorder*, from a power supposed to reside for its cure in a family of that name. They touched the part affected in the manner of Valentine Greatrakes, and muttered certain charms. This family of Machaons never would accept any gratuity.

On long journeys, the Highlanders repelled the attacks of hunger by a small quantity of the dried root of *corr* or *cor-meille* (*orobus tuberosus*, or wood-pease). This, Pennant thinks, may have been the Caledonian food described by *Dio*, of which the quantity of a bean prevented both hunger and thirst, and which the people had ready on all occasions. The extraordinary marches of the Highlanders under Montrose and Dundee become more credible when we know of the use of the *cor-meille*.

LOVE OF CHILDREN.

Tell me not of the trim, precisely arranged homes where there are no children—'where,' as the good Germans have it, 'the fly-traps always hang straight on the wall'—tell me not of the never disturbed nights and days, of the tranquil, unanxious hearts where children are not: I care not for these things. God sends children for another purpose than merely to keep up the race—to enlarge our hearts, to make us unselfish, and full of kindly sympathies and affections; to give our souls higher aims, and to call out all our faculties to extended enterprise and exertion; to bring round our fireside bright faces and happy smiles, and loving, tender hearts. My soul blesses the great Father every day, that he has gladdened the earth with little children.—*Mary Howitt*.

HOOPS AND CRINOLINE.

Let it be recorded, as a matter of detail, that at every important performance the advertisement beseeches the ladies to come without their hoops. This fashion seemed even to contemporaries to be as troublesome as it was ridiculous. In *Faulkner's Journal*, from the 31st of January to the 4th of February 1744, the committee of the Charitable Musical Society, in announcing the *Messiah* for the 7th, once more entreates the ladies 'to lay aside their hoops,' representing that if they will abandon that fashion 'for one evening, however ornamental, the hall will contain a hundred persons more, with full ease.' When the Festival of the 1st of May 1790 took place at Westminster, a handbill, signed 'John Ashley, by order of the directors,' containing the regulations for the carriages and other encumbrances, stated also, 'no ladies will be admitted with hats, and they are particularly requested to come without feathers, and very small hoops, if any.' It seems as if these fashionable follies were chronic, for a similar announcement by the Sacred Harmonic Society, *apropos* of crinolines, would not be out of place at the present time.—*Schäfer's Life of Handel*.

THE RURAL LIFE.

BY JOHN FISHER MURRAY.

Ye who would serve the rural life,
Forswear
Contentions wearisome—life's wear and tear,
Town-bred ambitions—thoughts of gain or loss
Of worldly dress;
All wild unreasonable hopes of thine,
Straightway resign;
Satisfied in these meadows to possess,
Like innocent little children, happiness;
All debts of hope deferred, or wealth's increase,
Glad to compound and liquidate for—*PRACTICE!*

Ye who would serve the rural life,
Forbear
To trust implicitly in man-made laws,
Nor urge the justice of the justest cause
Too far.
Thou, rather, loving-kindness ever strive
To keep alive.
Annoyances and trespasses *will* be,
Which 'twere as well thou didst not choose to see;
By gentle bearing prove thy gentle blood—
Shine, thou, the mirror of good neighbourhood.

Ye who would serve the rural life,
Take care,
Whate'er thy duty, be that duty done,
Nor shun it, if thyself thou wouldst not sham.
Easy—Not thee!
At ease, and slothful—indolent and free,
God will not let man be!
Up, and be doing, then—the wilderness
Invites thy hand to conquer and to bless;
Deserts are but the earth at liberty—
'Twas Chaos when the universe was free!

Ye who would serve the rural life,
Declare
Th' eternal truth of nature, and be free
Of old simplicity. With reverence store
Unwritten lore.

Lo! the First Cause, benevolent and great,
In all we contemplate.
Nor let seclusion dull the social mind,
For friends estranged are kin to friends united;
Be sedulous of hospitable cares,
Angels have thus been cherished unaware!

Ye who would serve the rural life,
Despair
Of finding heaven on earth—days void of care,
Exemption from the miseries of life,
And unsought strife.
Thy heaven on earth is but a heaven of clay,
Passing away.
Tenant at will of evanescent hours,
Joys unsubstantial, transitory powers;
Steward of these lands, and of this life of thine,
Commanded to improve, and to resign!

HINTS OF NATURE.

A MAN who can take a hint well, ought to be held in esteem. He manifests a certain greatness as well as refinement of soul, when he infers neither more nor less than is meant, and acknowledges the courtesy of a friend's intention by prompt respect to his feelings. We feel at ease with such a man; we know that any topic of conversation *mal-à-propos* and unpleasant will be adroitly changed, or, if we are in a mood for solitude, our well-bred and sensible visitor will withdraw, without offence on either side. Intimacy becomes stronger and more congenial when the sin of boredom is judiciously avoided. It is an old story, that the extremes of a virtue are akin to faults. One may sometimes meet with a man of such exquisite, or rather morbid sensibility, as to be continually on the lookout for a veiled meaning, and awkwardly afraid of ruffling the feathers of his acquaintance. On the other hand, there are men so obtuse and spiritually purblind, that verbal intimations must be as plain as a stage-aside, and expression of countenance as unmistakable as a stage-hero's, or they will not be comprehended: in other words, there are some men who put us under the necessity of giving a *broad hint*, to which even the coarse-grained nature of our annoyance does not entirely reconcile us. Now, just as prodigality is not so mean as avarice, I think it is better to be thin-skinned than to wear a rhinoceros's hide.

Possibly, I give too much importance, in my estimation of character, to this capacity of taking a hint, for I judge of power of mind, as well as refinement of feeling, by observing to what extent the faculty is possessed. With a view to this generalisation, however, it becomes expedient to extend our cognizance beyond hints social, to hints intellectual and imaginative. Your one-idea gives the cut direct to any thought, sentiment, or fact not tending to his one idea. He does not love digression, to which the appreciation of hints must needs tend. His remarks may be forcible, and, in the main, just, but they will certainly become prosy and monotonous by virtue of being so rackingly relevant; the nail will be knocked on the head until it is broken off. Even when the one idea is a good one, you find that truth has got into the wrong hands. On the other hand, I apprehend that similes, metaphors, and images arise from the poet's or the orator's delicate perception of hints. Labour'd conceits and figures of speech do not affect us pleasingly, because we see that the poet went in search of them, and did not wait for a hint. It is one thing to pluck flowers by the stalk, and another to go out of your way to pluck

flowers. The latter occupation is perhaps innocent, but rather tiresome.

The foregoing remarks probably make apparent the meaning I attach to the word 'hint;' but it may be as well to employ a few words in stating the meaning concisely. A 'hint,' then, signifies something from without, which diverts the mind from one train of thought, and suggests another. In the perception, the mind is chiefly passive; but it becomes active in the reflective process to which that perception gives rise. It is clearly not enough that thought be interrupted; it must be directed into a channel more or less divergent.

I hardly know how to justify my saying so much of hints in general, since the idea I am bent on expressing relates to hints dropped by nature and taken by philosophers. If I were asked what mental property seemed to me of most service to a natural philosopher, my answer would be, capacity to take a hint; but as it is impolitic to ride a hobby too hard, I pause to make a large admission. Let it be granted, then, that logical acuteness, industrious research, fertility of comparison, ingenious analysis and synthesis, ready perception of consequences and conditions, and as many other such talents and accomplishments as occur to the reader, are essential to the development and enlargement of a science, and, in a subordinate degree, to the discovery of laws. The initial thought forming the basis of elaborate processes, and giving the clue to Baconian experiment, is generally due, I submit, to a hint given by nature herself accidentally, and often without emphasis. The qualities of mind necessary to enable a savant to build up and fortify a theory and systematise phenomena, are frequently found where the rarer power of appreciating a delicate suggestion exists in a much lower degree. By confounding the growth of a science with its beginning or birth, Lord Bacon was led into somewhat extravagant notions as to the effect of his philosophical process of putting nature to the question. He gave out, that in scientific matters, genius would thenceforth be superfluous—that an average intellect, working according to defined method, would be fully adequate to the requirements of human knowledge. Experience has shewn that he was wrong. Indeed, it would be difficult to conceive how a mind so sagacious and comprehensive could fall into a plain error like this, were it not that the highest genius is apt to be overpartial to its own offspring. *Maximus temporis partus*, as the great philosopher styled his work, is certainly not an overmodest title but then his real greatness of soul (in theory, not practice) well carries off a little magniloquence. It is not denied, then, that a great part of the bulk of our

knowledge, the improvement of its arrangement and instruments, and much theoretical and practical advancement, are due to steady and orderly argumentation and experiment. A great deal, too, depends on extending research into those fields where nature is most likely to be suggestive. Any accumulation of observed phenomena will probably contain intimations which genius may lay hold of and utilise. By these means, also, we are more likely to encounter striking suggestions, which, even without the aid of extraordinary mental endowments, will not escape the notice of disciplined intellect.

Practical arts necessarily existed, and have often been considerably developed, long before the corresponding sciences can properly be said to have originated. In several instances, the occasions are recorded on which great accessions and improvements of practical skill came to be made; and it will be observed, that in most of these, nature took the initiative—that is to say, our knowledge was acquired, not by directly questioning nature, but by cross-examining her upon some little information casually given. In fact, mankind are not so much in the position of counsel, endeavouring to extort suspected truth from an examinant, as of counsel cross-questioning upon some point which takes them by surprise, but which they skilfully turn to account. 'Critics,' says Shenstone, 'must excuse me if I compare them to certain animals called asses, which, by gnawing vines, originally taught the great advantage of pruning them.' I do not quote this for the sake of the sentiment, but of the simile, which in some measure illustrates my meaning.

I have made one considerable admission, and now have to make another. No illustration of this theory of hints can be produced that shall not be an illustration of some other truth as well; for no faculty exists by itself and independently of others—all results and all processes of thought are by their nature complex; yet, in some of the examples I shall adduce, the faculty of taking a hint seems sufficiently predominant for my purpose. The doctrine of specific gravity was forced upon the attention of Archimedes on his entering a bath, and finding that the immersion of his body caused the water to overflow—no very remarkable incident, and one doubtless commonly observed, but he took the hint which others overlooked. Some merchants, having lighted a fire on the sea-beach, remarked among the embers a curious crystalline substance, produced by the fusion of sand and the ashes of sea-weed: some practical mind among them seized upon the incident, and gave, or rather restored to modern science and civilisation, one of their most important coadjutors—glass. A chandelier swinging from a church-roof, set Galileo thinking about the theory of oscillation, and as a result, we have the pendulum. The wife of Galvani, being an invalid, was indulged on one occasion with a dish of frogs; Galvani observed a convulsive motion in one of these on being touched by a knife, and making note of the fact, succeeded, on further inquiry, in establishing the science to which we owe the electric telegraph. A boy was employed to work the valves of a steam-engine, and, getting tired of his monotonous occupation, ingeniously connected them with the engine itself, which became self-acting. We, observers after the fact, wonder so simple a contrivance did not occur before to maturer minds. The high-pressure steam-engine was itself probably a result derived from a very commonly observed phenomenon. The fabrication of fire-balloons originally occurred to the brothers Montgolfier in a similarly accidental way. I may mention too—bearing in mind that other faculties besides ability to take a hint combined to produce the result—the story of Newton and the apple. Whoever will take the trouble to look over a history of the arts and sciences, can easily enlarge the list.

In several of the above instances, the *experimentum crucis* seems to have been furnished by nature herself—that is, by a combination of circumstances, humanly speaking, fortuitous. In some cases, the mind of the observer was already engaged on kindred topics, which circumstance no doubt increased its sensitive appreciation of any suggestion from without bearing on the subject of thought. Probably a great many other facts, lying at the foundation of different arts and sciences, were similarly noted, being stumbled over rather than hunted after and found. It is likely, for instance, that the directing power of the magnet was accidentally remarked.

Man, however, is not content to stumble over his information, and make the best of it he can; he peers here and there in search of particular knowledge, and, ten to one, misses it after all; but then he is put in the way of obtaining other knowledge, perhaps no less important, and such as it had not entered into his heart to conceive of.

The amount of scientific acquisition made in this way is surprising. In the middle ages, and since, men sought for the elixir of life and philosopher's stone. They were not more successful in the direct object of their labour than the daughters of Pelias, when, acting on the prescription of Medea, they cut their aged father to pieces, in order to renew his youth by the process of boiling. The alchemists, however, were the founders of chemistry. We owe to them gunpowder (*abritomen*), and many of the most common and useful drugs. It was once as needful for men of high and low degree to have their horoscopes taken, as it is now to sit for photographic likenesses. To that end, the astrologers studied the grammar of the stars, and made sorry progress. Yet, whilst meditating on these things, they rocked the cradle of modern astronomy. It is extremely common for philosophers to light upon one truth while in search of another. Whoever has attempted original investigation, knows how apt the mind is to be led into collateral thought, and how often the more important results of research are due to those digressions.

We easily see that success would be highly improbable if men set about inventing sciences *mero motu*, and depended for the discovery of occult agencies on direct investigation. The connection between light, heat, electricity, and magnetism would never have been discovered by theory or experiment. Through chance coincidences, the existence of such a connection came to be suspected; and thus the prosecution of this branch of inquiry was brought within the province of systematic thought. The researches of Professor Faraday on these subjects are models of experimental skill and sagacity. Who knows but that accidental phenomena may ultimately lead to the discovery of the law governing this connection, and enable us by theory to account for the different manifestations? At present, speaking mathematically, the theories of light, heat, &c., are distinct, and nothing appears from them indicating such a connection as really exists, or, indeed, any connection at all. Again, the theory of gravitation, as it at present stands, does not answer the inquiry whether or not that force and other forces are merely modifications of the same central energy; and to prove the negative or the affirmative, seems beyond human power. Chance may, some time or other, furnish a clue. For what we know, gravitation may be *en rapport* with the imponderable agents. We cannot at present modify the force of gravity. However much we change a body chemically or mechanically, gravity acts as before. Yet there is nothing to shew that it may not be varied just as electricity, heat, &c. may, by some complex and unknown arrangement. There may be, and probably are, other agents—some, perhaps, included in the vague category of chemical forces—susceptible of theoretical and even mathematical

representation, besides those already within man's ken; but an attempt, even by the highest genius, directly to discover whether or not such agencies exist, would fail. When genius has a clue, it may follow it; but nature will not be forced.

Of course, and as I intimated before, all our knowledge is certainly not due to hints from nature. A good many important results have been obtained by fortunate guessing. If I were inclined to stretch a point, I would say that in such cases the hint given is infinitesimal. Thus, the discovery by Franklin of the identity between electricity and lightning, looks very much like a guess; indeed, the principal credit is due to the ingenuity of the means by which that philosopher established the fact. In the history of science, we find many happy guesses, which for long periods remained merely barren speculations, because the guessers could not test their conjectures.

For many discoveries, credit must of course be given to direct inference. Mechanical improvements, especially, are often made by the adaptation of means to ends, and some of them possess much scientific importance. For instance, in the working of voltaic batteries, it was found that the bubbles of gas adhering to the positive metal impeded the chemical action. Mr Smee conceived that if the surface of the metal were rough, the gas would pass off more freely. He accordingly precipitated on the positive metal the black powder of platinum, and the result justified his expectations. The sustaining battery of Daniel is also due to elegant reasoning. I have said that discoveries lying in the direct line of development of a science are often—it may almost be said generally—due to direct logical processes. When once the fundamental laws of action are discovered, it becomes a matter of mathematical analysis to find out related phenomena. The theory of light, perhaps, has been most fruitful in these species of results. Some of the more intricate and beautiful phenomena of polarisation were detected by the interpretation of mathematical formulae deduced from the undulatory theory. I must not omit to mention a great triumph of this kind recently achieved. The discovery of the planet Neptune by Leverrier and Adams was made by purely abstract investigation proceeding on the known law of gravitation and the ascertained motions of other planets. Astronomers were well aware that certain perturbations of Jupiter remained unaccounted for. The inference was natural, that another planetary body occasioned them. That inference was made. Leverrier and Adams, skillfully applying the machinery of modern analysis, or, to speak profanely, 'putting x into a mill,' established the fact, and determined the approximate elements of the disturbing sphere. The degree of scientific tact and learning requisite to grapple successfully with such a problem, is certainly high; at the same time, the amount of *genius* required is perhaps not very extraordinary. It was a matter of development, a working according to known methods and by known instruments. Newton's analysis of the moon's orbit remains unapproached. He invented the instruments by which he worked, and the process in which he used them.

In spite of the great expansion of old knowledge and accession of new, of which the nineteenth century is excessively boastful, it remains a singular fact, that science cannot jump, however we may spur it on. The human mind must come very close to a new truth before it can lay hold of it, and make that truth its own. Even in trivial matters, the same law prevails. Our very fashions grow. Modern costume is the reverse of picturesque or comely, yet we cannot invent a dress to supersede it on any ground of indisputable superiority. Now and then, a preposterous 'mode' or a new philosophical theory comes up, but we shortly find that both are merely revivals of ideas old as the hills;

and we think of the old saying, 'There is nothing new under the sun.' Man pants for knowledge as the hind for the water-brooks. No wonder he sometimes becomes impatient of growth, and longs for some California in the fairy fields of science, where knowledge may be picked up in nuggets. Well, if we cannot know as fast as we wish, we can speculate to our hearts' content; and we do speculate on the 'conservation of forces,' the 'correlation of forces,' and the 'central law.' If coming knowledge casts its shadow before, perhaps that shadow is speculative thought.

KRASINSKI: A TALE.

IN FOUR CHAPTERS.—CHAP. III.

MAMMA'S LETTER.

MY DEAR BROTHER—I do not wonder that you blame me; everybody must do so. But what makes me more miserable than I otherwise would be—for I am now intensely wretched—is, that I fear I shall never be able to account rationally for my conduct; for if I were to make known the real cause of the alteration that mamma has told you of, I should subject myself to ridicule as well as blame. You know how I loved Krasinski, and what happiness I anticipated in being his wife; and you can hardly suppose that his not having saved that poor infant—though I own it did surprise and pain me—could be the sole cause for my acting as I have done. I am aware mamma and others think it is; and I do not deceive them, from the fear of ridicule, as I have said, and because mamma, who always frets when Arthur is long silent, would be alarmed by my story, which might make her very ill, and she is by no means strong at present. Even to you, dear Everard, I could not tell my secret, were you here, but writing it is different; and I can't bear that you should think me so weak and capricious as I see by your letter you do. So I am going to tell it to you; and, indeed, it will be a relief to me to tell it to somebody, for I think of it all day. Besides, it may induce you to make inquiries about Arthur. Do write to the consuls and everybody likely to know about him—that is, if you have not heard from him since you last wrote. De Rosny is the name of the gentleman he told us he was going to travel with; and Krasinski says they were to meet at Rome, which agrees with Arthur's last letter. You will wonder what all this means, and why I am unusually anxious about dear Arthur—well, you shall hear.

Mamma has told you about the drowning of that poor, dear, little child. You may imagine how that accident shocked me! The little face and outstretched arms rising from the water, were before my eyes all day—I could not shut them out; and then I was vexed, surprised, and mortified at Krasinski's conduct. But I tried to excuse him, and to think what a dreadful thing it would have been if he had been seized with cramp—as he says he was the last time he went to bathe—and drowned too; though I should have been so proud of him, and loved him a thousand times more if he had tried to save her; and, O Everard! if he had been drowned, I should have adored his memory, and, I am sure, been much happier than I am now with this horrid idea that has taken possession of me, and that I cannot, cannot shake off.

I went to bed that night with my mind oppressed to the greatest degree with what had happened. I generally go to sleep the minute I lie down, but that night I could not. If I did begin to doze, I woke with a start and the horrid recollection of what I had seen till at last, irritated and weary, I began to cry, which you will think very childish; but I believe it did me good, for I fancy I cried myself to sleep.

Now, you know I have often said that I never dream, and Dr D— says it is because I sleep so very sound; and Mrs C— says, that doubtless I do dream, but that when sleep is profound, we do not remember our dreams; and I incline to this opinion; because, sometimes at the moment of waking, it appears to me as if a scene of some sort was slipping away from me, like a dissolving view or a diorama; and I try in vain to catch at it: it is gone like a breath; and this has happened several times lately; and now I think that I had had this dreadful dream before, but did not recollect it.

Well, I at last cried myself to sleep, and dreamed that I was in bed, just as I really was, and that the door opened, and Arthur came in, and walked slowly up to the foot of the bed, and stood looking at me with such a sorrowful face! oh, so sorrowful! so pale too! and his hair looked wet and dripping with water. And I thought I sat up in bed, and asked him if he had saved the child, and he said: 'No; the child is with us.'

And I said: 'Where is that?'

'In the other land,' he answered. Then he shook his head reproachfully, and said: 'She is happy; but if you will not attend to what I tell you, you will keep me in darkness and trouble.'

Then I said I would attend, and asked what he wanted me to do.

'To promise me,' he said, 'that you will not marry Krasinski till I can be present at the wedding, and give you away;' and I said: 'I promise.'

Then he bowed his head, and said, he hoped I would keep my promise, and went away out at the door slowly, as he had entered; and when he turned round, I saw inscribed on his back, 'Drowned at Venice, 9th April 1847.'

Then I awoke, and I was so impressed with the reality of this dream, that I was dreadfully frightened—though I was not frightened at all in my sleep—and I buried my head under the clothes, and lay in terror till I saw a gleam of daylight; and then I ventured to uncover my face and look about; and never was I so glad as when I heard the servants getting up, and I could ring for Bella to come and dress me. I rose directly, and went into the garden, where I walked on the terrace till the bell rang. When I went into the breakfast-room, everybody said how ill I looked, attributing my appearance to what had happened the day before, and I did not contradict them.

No one but myself can judge what the dream of that night was—how like reality. I afterwards dreamed it again and again, with slight variations, and Arthur looked more mournful and reproachful every time, till I felt, let people think what they would, I must do what he told me, and that I never could be happy in my marriage if I did not.

I assure you, my dear brother, that I struggled valiantly against this weakness, as you must think it; but the time fixed for the wedding was at hand, and every day my new things were arriving from London, and my aunt and cousin, and Colonel Gordon, who was to give me away, were coming; so I plucked up courage, and told mamma that I did not feel at all well, and that I should therefore request Krasinski to defer our marriage till the spring, as I was quite unequal to undertake the journey to Rome. This was just after mamma's last letter to you.

I saw very well that she did not believe that this was the whole truth; but you know I durst not tell her of the dream, she would have been so dreadfully frightened about Arthur. However, she said if that was the case, she must send for Dr F—. I begged her not to do so, but she did; and accordingly he came. I am sure she told him that she feared I had something on my mind; for he questioned me so

searchingly, that at last I confessed that I was much troubled with disagreeable dreams. He said he had no doubt that they were caused by some derangement of the stomach; and looked at my tongue, and attributed my depression of spirits and the dreams to what he calls nervous dyspepsia. He may be right. I have certainly lost my appetite entirely, and feel a dreadful languor that I cannot account for. Of course, he ordered me some medicine, which I took for a fortnight; but I got worse instead of better, for I had the dream every night. I thought Arthur looked more mournful than ever, and that he reproached me bitterly for not obeying him, and said I should repent it when too late. I positively dreaded going to bed; and Krasinski's visits, instead of giving me pleasure, actually made me miserable; and if I had not been ashamed, when I saw him coming up the gravel-walk, I should have run away, instead of going joyfully to meet him, as I used to do. So, at last, I grew desperate, and resolved to act for myself without consulting anybody.

Mamma had broken the ice a little, by telling Krasinski that she feared I was falling ill, and that the marriage must be deferred; but he would not hear of it, and urged, on the contrary, that we should be married without further delay, in order that I might get to a better climate. He said he had no doubt that the moist air of this place was killing me, and that he was beginning to feel the effects of it too. This alarmed mamma; and as I saw she was inclined to coincide with Krasinski, there was no time to be lost. So I commenced the conversation by saying, that it was very strange we did not hear from Arthur. I must tell you that this was a subject that always wearied Krasinski; for though, since my dream, I had never mentioned Arthur's name, scarcely a day passed that mamma did not remark on his long silence; so he made no answer, but began singing a favourite song of mine—you know he has a fine voice—and sat down to the pianoforte: but I had screwed up my courage, and was determined to go on.

'Don't play now,' I said; 'I want to speak to you.'

He turned round on the music-stool, still keeping the fingers of his right hand on the keys, and said with a look of impatience:

'Bien; parlez! Qu'est-ce que c'est?'

This manner of his rendered it more difficult for me to go on, but I said: 'I should like to know if Arthur really went to the east with Monsieur de Rosny.'

'Ah!' said he, shrugging his shoulders, and beginning to play again, 'who knows?'

This made me rather angry; and I said drily: 'I am aware this subject is not an agreeable one to you; but this seemed to offend him, and turning sharply round, he said:

'Comment? Que voulez vous dire?'

'I do not mean to say anything to displease you, but I know you are weary of mamma's wonderings and questionings about Arthur; but the truth is, I am getting very anxious myself.' Here he shrugged his shoulders again, and made a gesture with his lips and eyebrows, as much as to say that he could not help my folly.

I thought this unkind, for he might have shewn more sympathy with my feelings, and I continued hastily: 'In short, Krasinski, I am so uneasy, so seriously alarmed indeed, that I cannot think of being married till I hear some satisfactory news of Arthur. I have more cause for alarm than I choose to tell mamma—I have had dreadful dreams about him. You smile'—and he did smile contemptuously, though he looked very pale, and in a manner amazed—'but you would not smile in my case. I see him every night—in my dreams, I mean; but I see him as plain as I see you now; and he tells me'—

'Assez, mademoiselle,' he said, interrupting me; and he rose from his seat and took up his hat.

I rose too, and laid my hand on his arm. 'Listen, Krasinski,' I said. 'I have never believed in dreams—but this seems more than a dream: you can have no idea of it. It is *that* that has made me so ill—so depressed—so changed in everything. I can scarcely help believing that it is Arthur himself that comes nightly to my bedside and tells me'—Krasinski, who could not contain his indignation at my folly, here attempted to leave the room; but I was between him and the door, and held his arm fast, for, now I had begun, I was determined to go through with it. 'He tells me we must not be married till he can be present at the wedding, and give me away, and I have promised to obey him.'

'A votre plaisir, mademoiselle,' said he, bowing, with an attempt at calmness, but evidently fearfully agitated; and he laid his hand on the latch of the door.

'Don't be so hard upon me, Krasinski,' I said, bursting into tears, for I could keep up no longer. 'Heaven knows what I have suffered! I could not tell mamma; I was ashamed to tell you; but this dream speaks to me like a voice from the dead. I fear something dreadful has happened to Arthur; I cannot help believing that he was drowned at Venice—drowned on that 9th of April, the very day that you said you came away together! Was he?—was he? Confess the truth!'

Krasinski evidently thought I had gone out of my senses, for he stood looking wildly at me, with the strongest expression of fear and horror on his countenance whilst I uttered these words; and then exclaiming: 'Grand Dieu! est-il possible!' he rushed frantically out of the house.

Mamma, who happened to be at her bedroom-window, saw him flying down the garden, and suspecting that something had happened, came in search of me, and found me lying on the floor in the drawing-room. I had fainted. The next day I received a letter from Krasinski, saying that he could only explain my extraordinary conduct by supposing that I wished to break off the engagement; that he was the last man in the world to claim the hand of a lady under such circumstances, however strong his attachment and deep his regret; and that since he had remarked for some time that his presence was rather a source of pain than pleasure to me, he should leave Ambleside immediately. It was a calm, gentlemanly letter; but he is evidently very indignant, and I cannot wonder at it; for my behaviour must be utterly incomprehensible to him. I often fear I have destroyed my own happiness and his by yielding to an unpardonable weakness.

I have but one consolation—the dreadful dream has left me. Only once since Krasinski went have I seen Arthur in my sleep, and then I thought he looked cheerful, and bent over my bed, and kissed me, and said: 'Good girl! Good girl!' And now, dear Everard, lose no time in making every inquiry about Arthur, and write without delay to your unhappy but ever affectionate sister,
EMMA EDMONDS.

This letter, which had been looked upon as nothing but the weak effusion of a nervous girl, could hardly fail, when taken in conjunction with De Rosny's strange experience, of making some impression on the young men, unwilling as they were to attach any serious importance to ghostly admonitions. They discussed the subject over and over again, generally concluding, however, that, notwithstanding the singular coincidence of the vision and dream, it would be absurd to attach importance to them, because, if people could come back from the other world to tell their wrongs, 'ghosts would be as plenty as black-

berries,' and the fact of their appearance placed beyond the possibility of doubt.

Still, they heard nothing from Arthur; and, midst the pleasant parties and jovial meetings to which Everard introduced his new acquaintance, he would sometimes exclaim: 'It is certainly strange that we have no news of my brother!'

'Suppose we go to Naples!' said De Rosny one day to Everard, shrugging his shoulders, as if in half contempt of the proposition he was making; 'it will be all in my way; and a little change will do you no harm.'

'Well, things are getting rather slack here,' answered Everard. 'I don't care if I do go so far with you, if I can get leave for a couple of months.'

The leave was applied for and obtained, and with the first opportunity, they took ship for Naples.

AN INTERESTING ACT OF PARLIAMENT.

READER, did you ever read an act of parliament? Perhaps you remember, once upon a time, lighting upon a document which began, 'Whereas it is expedient to . . . Be it enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in Parliament assembled, and by the authority of the same.' Then you looked at the interpretation-clause, and found that, 'for the purposes of this act,' 'land' shall mean 'houses,' and a church a chapel; that the word 'bishop' shall comprehend and apply to an 'archbishop;' or, as appears by one example of legislative facetiousness, that 'the word coals shall include cinders' (which, by the way, we learn this last every day from our coal-merchants, without the aid of an act of parliament); that man shall mean woman, and many men mean one; and so on. These statutable equivalents you felt disposed to acknowledge as rather amusing preludes to the study; but when you proceeded in your inquiries, and came upon words of unknown meaning and un-English aspect—*estates tail, pur autre vie*, tenants in common, pleas, demurrers, and replications—your glazed eyes passed speedily over the mass of type, till the delightful apparition of the final clause, 'this act shall apply to England only,' almost drew from you the exulting cry of Diogenes, on a similarly dull occasion: 'Courage, lads; I see land!'

Of course the study of acts of parliament, like all other studies, has its difficulties, and a good deal must, we suppose, be left to the lawyers; and you are perhaps very well content to leave *all*, with a parting benediction of 'much good may it do them.' *First*, however, bear a word of remonstrance. *Imprimis*, it is of no use abusing the lawyers, as is often done, for monopolising that of which you give them the monopoly; *Secondly*, You are ignorant at some peril, for the law of England presumes that all Englishmen know the law, and will certainly deal with them as if they knew it; and *Thirdly*, Acts of parliament offer a not uninteresting means of studying the manners, political movements, and predominant thoughts of the various eras in our national history.

Now, it is not our intention to touch the first two points above mentioned, or even to illustrate, at any great length, the third in order; but there happens to be an act of parliament, passed not long since, which has the rare virtue of being not only useful—for we fear there are some acts of parliament which are not entitled even to the praise of utility—but also interesting. Let us look together at this 'interesting' act of parliament.

It is known as the 19 and 20 Vict. c. 64, and is entitled, 'An Act to repeal certain Statutes which are not in Use;' and it enacts in the usual form, that 'the

acts hereinafter mentioned, together with all enactments (if any) confirming, continuing, or perpetuating the same, or any of them, are hereby repealed: provided always, that such repeal shall not affect any legal proceeding commenced under any of the said acts before the passing of this act.' This is the whole act, with a list of statutes repealed, one hundred and eighteen in number, ranging from the 18th year of the reign of King Edward I. to the 17th George III., and comprising, as may be expected, a great variety of subjects. Of course, these are not all the acts which were passed during this period. Great numbers have been from time to time repealed; many still remain in force. What changes have come over English society—its politics, its education, its religion, its language—in the interval! Look in the list at the statute of 7th year of Richard II.'s reign, entitled, 'No man shall ride in harness within the realm, nor with launcegays.' Here is a word now probably known only to one in a thousand of the community. We confess we were more than half inclined to associate the term with some sort of *mauvais sujet*, male or female, and were eagerly on the look-out for some further light, when we discovered evidence that these launcegays were a most inveterate and deeply rooted subject of complaint; for thirteen years afterwards we find in our list:

20 Ric. II. c. 1.—No man shall ride or go armed: launcegays shall be put out.

Certainly, most peremptory! Still we were no nearer to the meaning of launcegays. What an appalling thought, too, that up to the 21st day of last July, one might have been breaking the unrepealed statutes of one's country every day without knowing it! Suppose a launcegay should turn out to mean a dog-cart, a Scotch terrier, or a pretty cousin!

Distraught at the thought, we hurried down to our library of reference. Several dictionaries were searched in vain. At last Nares's Glossary gave us: 'launcegay, a kind of spear.' Camden mentions it in his *Remains*; and Tyrwhitt, in his note on *Canterbury Tales*, says: 'The said Evan then and there, with a launcegay, smote the said William Tresham through the body a foote and more, whereof he died.' Not to be wondered at, under the circumstances, and also accounting for launcegays being forbidden in the troublous time of King Richard II., Bolingbroke, Percy, and old John of Gaunt, time-honoured Lancaster.

The fifth next in order has rather an amusing title:

4 Hen. IV. c. 25.—An hostler shall not make horsebread. How much he may take for oats.

Do you remember the scene in *Henry IV.*, at Rochester, in which the carrier, who has a gammon of bacon and two *razes* of ginger to be delivered as far as Charing Cross, complains that the house is turned upside down since Robin ostler died, to which the other replies: 'Poor fellow! never joyed since the price of oats rose; it was the death of him.' Reader, mark the coincidence of date; was it not rather this act of parliament killed him?

Are you an Irishman?—then don't read the next paragraph; it is written only for Englishmen:

1 Hen. VI. c. 8.—What sort of Irishmen only may come to dwell in England.

Here is a problem! Verily our ancestors in Henry VI.'s reign didn't evade difficult subjects of legislation. Let us try our hand at a specification. They should be honest; not repugnant to soap; not combative; have at least one pair of trousers approximately perfect, and a hat with the crown in; not have more than fifteen children; nor be too much given to a 'drop of the craythur.' Half of us, however, in these days of degenerate indolence, to save ourselves trouble,

shelve the difficulty by saying, 'No Irish need apply.' Our fathers boldly looked the difficulty in the face, and, what is more, legislated for it.

Let us look at the act itself, which will shew us something of the Norman-French not yet gone out, and also serve to mark that the Commons were not yet advanced to the dignity of a legislative power; it is, as we shall see expressed, to be enacted by the king, with the assent of the Lords, *at the request* of the Commons. It was not till the reign of Charles II. that the preamble of acts of parliament assumed the shape now in use.

'Item pur tant ge diverses homicides murdres rapes roberies et autres felonies riotes conventicles et male-faits jatarde ount estez faitz en diverses countees d'Engleterre par gentz [the intelligent reader will not mistake this for *gens*] nus en Irlande reparantz a la ville de Oxenford et illoques demurrantz desoutz la jurisdiction del' université d'Oxenford a grande peure de toute manere poeple demeurant la environ come par toute la communalte du roialme assemblez en cest parlement fuist grevousment di ces compleint.' After this recital, the act goes on to say, that the king, with the assent aforesaid (that is, of the Lords), and *at the request of the Commons*, ordained that all persons born in Ireland eject themselves out of the realm (soient voidez hors de roialme) in a month's time, on pain of losing their property and being imprisoned at the king's pleasure. An exception is allowed in favour of graduates, clergymen, and others; and amongst them, merchants and other inhabitants of the cities and boroughs, of good fame, who can give security for their good behaviour. All scholars of Ireland, dwelling in England, are to find security for their good behaviour, and to bring testimonials from the lieutenant shewing that they are del' obeissance du roy; and from the Feast of St John then next, no person born in Ireland is to enter the realm of England without such testimonial, on pain of being treated as a rebel. The phrase del' obeissance du roy reminds us that, notwithstanding the achievements of Henry II. and Strongbow, Ireland was still only partially subdued, a large portion being under the government of native chieftains, which continued to be the case till the reign of Elizabeth.

Welshmen, by the way, seem to have had rather a bad reputation about this time; in proof of which, we find the following statutes:

4 Hen. IV. c. 27.—There shall be no wasters, vagabonds, &c., in Wales.

4 Hen. IV. c. 29.—Welshmen shall not be armed.

2 Hen. VI. c. 4.—Welshmen indicted of treason or felony, that do repair unto Herefordshire, shall be apprehended and imprisoned, or else pursued by hue and cry, and a forfeiture of those which do not pursue them.

It must be remembered, however, that Wales was only even nominally annexed to England in Edward I.'s reign, and was long afterwards greatly disaffected; and in particular, that the fourth year of Henry IV.'s reign was the exact time of the great outbreak in Wales, headed by Owen Glendwyr, in concert with the insurrection under Harry Hotspur, which terminated in the battle of Shrewsbury. With this confluence of powerful and daring spirits against him, we can understand the new king—himself without title derived from might—very readily consenting to an act of parliament enacting (*valent quantum*) that 'Welshmen shall not be armed.'

We may form a tolerably fair estimate of the very primitive state of English society about this time, from an act of the fifth year of Henry IV., long since repealed, and therefore not in this list; but which serves, however, to illustrate those that are. It bears this exhilarating title: 'It shall be felony to cut out the tongue or pull out the eyes of the king's Sings'

people;' and proceeds: 'Item—Because that many offenders do daily beat, wound, imprison, and maim divers of the king's liege people, and often purposely cut out their tongues or put out their eyes, it is ordained and established that in such case the offenders that so cut tongues or put out the eyes of any of the king's liege people, shall incur the pains of felony.'

The 9 Hen. V. stat. 1, c. 10, in our list has an odd title: 'Keels that carry sea-coals to Newcastle shall be measured and marked.' Here the now proverbial improbability seems to be quite a common thing, 'to carry coals to Newcastle.' The act, however, refers to small vessels, called keels, which brought the coals to be shipped on board the colliers at Newcastle.

Some useful acts appear in the list, shewing that our forefathers had, terribly early in English history, some sense of the value of sanitary reform. As early as the reign of Richard II. we have an act entitled, 'The punishment of them which cause corruption near a city or great town, to corrupt the air;' and again, in Henry VII.'s reign, 'An act that no butcher slay any manner of beast within the walls of London.'

Towards the reign of Henry VII., the various trades seem to have begun to attract legislative attention. The first act on the list in his reign is 'an act for finers of gold and silver;' soon after, 'an act concerning upholsterers;' then an act, entitled 'pewterers walking.' Then in Henry VIII.'s reign, 'an act for avoiding deceits in worsteds' (Ah, ladies, how could you allow this to be repealed?); and so on, till we are at last fairly launched into the consciousness that trade is getting brisk, that we are become a nation of shopkeepers, and are legislated for as such. Coining, apprentices, horses, worsted yarn, coverlets, leather, steel, woollen cloth, raw-hides and calf-skins, hats, are all subjects of legislation before the close of Queen Elizabeth's reign. One word, however, as to the pewterers aforesaid. They appear to have been a dreadful torment, for, in the 4 Henry VIII., there is again an act 'pur le pewterers,' and in the twenty-fifth year of the same reign, 'an act concerning pewterers.' Let us see what these pewterers have to say of themselves. The act in Henry VII.'s reign is in the form of a petition, but, be it observed, the *Commons* are included:

'To the King our Sovereign Lord, and to the noble Lords Spiritual and Temporal, and Commons in this present Parliament assembled, humbly and lamentably shewn and complain unto your most abundant Grace, your humble subjects the pewterers and brasiers of your cities of London and York, and of all other places of this your realm, That whereas many simple and evil-disposed persons, using the said crafts, daily go about from village, from town, and from house to house, as well in woods and forests, to buy pewter and brass, and that knowing thieves and other pickers bring the vessels they have stolen 'to them in such hid places to sell, and sell it for little or nought; and about they bring it into privy places, or into corners of cities and towns, and there sell much part of it to strangers, which carry it over the sea by stealth; also, the said persons so going about, and divers other using the said crafts, use to make new vessels, and mix good metal and bad together, and make it naught [this word deserves notice], and sell them for good stuff, where, indeed, the stuff and metal thereof is not worth the fourth part that it is sold for, to the great hurt, deceit, and loss of your subjects; also, divers persons using the said crafts have deceivable and untrue beams and scales—that one of them would stand even with twelve pounds' weight at one end against one quarter of a pound at the other end—to the singular advantage of themselves, and to the great deceit and loss of your subjects, buyers and sellers with them.' After this exordium, they pray that it be enacted, that pewter and brass ought to be of a certain goodness;

that makers shall set on their marks, searchers be appointed, and so on. You see it looks like little else than an attempt of the great 'pewterers' to crush the little ones, whose descendants we may still recognise going about with their little furnaces of hot coals as 'pewterers walking.'

The next act renders the former perpetual; while the third complains of the apprentices repairing unto strange regions, and teaching foreigners the 'craft and mystery of the pewterers,' to the great impoverishment of the same, 'which before this time has been one of the best handicrafts within this realm.' The pewterers, by the way, don't seem to have had very enlightened notions about free-trade: but how well this marks the increased facilities for travelling, and readiness to travel: we are not all going to stay where we were born, we can tell you! We have here the foreshadowing of the ready locomotion of these modern days.

The acts 'concerning Egyptians' refer, as most of our readers know, to the gipsies. The 1st in Henry VIII.'s reign recites that they use 'great subtil and crafty means to deceive the people, bearing them in hand that they by palmistry could tell men's and women's fortunes, and so many times by craft and subtilty have deceived the people of their money, and also have committed many heinous felonies and robberies;' and enacts that all such persons shall leave the realm within sixteen days, upon pain of imprisonment and forfeiture of goods and chattels. By the act of Philip and Mary, the penalty is death. Certainly, it was time that these statutes were repealed; but it is not very encouraging to remember that amongst us now, three centuries after the passing of these acts, there are still persons, as the newspapers within the past month have shewn, who are the dupes of those who persuade them that they by 'palmistry can tell men's and women's fortunes, and so by craft and subtilty deceive them of their money.'

Our space is now exhausted. Of course, we have been obliged to leave the major part of these acts of parliament untouched. They constitute, if looked into, a quaint and interesting commentary on the history of their age. The legislature have acted wisely in formally repealing them. No act should be allowed to remain on the statute-book that is not enforced. We ought to know under what laws we live, and to what we are amenable; and these one hundred and eighteen acts of parliament must have felt—if an act of parliament can feel—that they had survived their day.

A FORENOON CALL IN ALGIERS.

YESTERDAY, we all started on our promised visit to the family of a cadi who lives in the neighbourhood of Algiers. A cadi, as all readers of the *Arabian Nights* must know full well, is a native justice of the peace, a Worship Shallow after the oriental pattern. Law and religion are here the same ordinance, and the ancient caliphs were at once pontiffs, judges, and doctors of the law, having under them three classes of vicars—the imamas or ministers of religion, the muftis or doctors of the law, and the cadis or judges. Who does not remember the summary punishments inflicted on evildoers in the golden prime of good Haroun Alraschid!—the fines and bastinadoes, the imprisonments and bowstrings which served as a gentle *divertissement* to the placid repose and sunny languor of Bagdad; how the wandering prince in disguise, and the scolding wife Fatima, dervishes, Jews, one-eyed calendars and water-carriers, and all the other *dramatis personæ* of the fascinating eastern romances, were invariably summoned once in the course of their adventures before the cadi, who usually ended his inquiry by a decree equivalent to 'your money or your life.' Dear, old, bearded dignitaries of our childish days!

The cadis are still retained under the French military government of Algiers, but with a greatly modified jurisdiction. Under the decree of the 26th of September 1842, the whole colony, including native or imported populations, of whom there are in Algeria no lack, are placed under the French law and tribunals. But there still remain some special Mussulman offences, which are brought before the native cadis as of old. The commonest cases of a penal nature referred to their judgment are those of drunkenness—by far the most numerous—breaking of the fasts, blasphemy, and improper behaviour in religious edifices. The questions relative to native divorce and heritage are also still under their jurisdiction.

The cadi to whose wife we were about to pay our respects, must have been a man of some substance, as he dwelt in a large house about a mile out of town, and under the same roof with various other members of his family. In fact, the establishment was somewhat patriarchal in size. The Moors have rarely more than one wife apiece, and the six ladies who received us were each married to a brother, a nephew, or a cousin of the cadi. The introduction was effected for us by some French ladies; and an English lady married in Algiers, who spoke the Moorish language perfectly, kindly accompanied to serve as an interpreter. We made altogether a party of ten, including three children, two of whom were little boys, under the age that excludes males from admittance into the sacred precincts of a harem. Leaving the main road, we plunged down a steep path, whose condition, nearly impassable from mud—this being the rainy season—plainly shewed that the female inhabitants of the domain were wholly unaccustomed to walk abroad. An English lady in a provincial town would have thoroughly scolded gardener and errand-boy, or laid down a cart-load of gravel with her own fair hands, rather than have been obliged to wade through such slush every time she went to the church, or the school, or the shop, or to see Mrs John Smith in the High Street. With some difficulty, and by dint of our goloshes, we got over the road, carrying the children with us, and passed through two ill-kept fields to the massive white house. The Moorish dwellings have much the look of a feudal border fort: the rooms open into interior courts, and present nothing to view from the outside save tiny slits like Gothic loopholes. The total absence of chimneys makes them still more devoid of life; but they are wonderfully picturesque amidst their cypresses and vine trellises, especially when, from their walls, as white as driven snow, they reflect back every colour of sunset!

We were received on the threshold by a fine-looking Moor, who was saluted as 'Monsieur Omar,' and who most courteously invited us in. He was in full costume, with a shaven head and a red fez. He ushered us into a small hall at the foot of the stair, down which, to meet us, came one of the ladies, a lively-looking woman about forty years old, with dark hair and eyes, and dressed in a variety of light silk and cotton garments, including of course the full trousers, of a pale-pink and white check. She shook hands with us all round very energetically, ejaculating 'Slama, Slama,' with every shake, which, we suppose, was 'How do ye do?' and then took us up a low flight of steps into a court surrounded by pillars and arches—a sort of domestic cloister, open to the blue heaven; then up a second flight of stairs to the second story of the same, round which clothes were hung out to dry, and into a large airy room, matted and carpeted, rejoicing in two exterior windows looking over the country and beautiful blue bay, in a four-post bed of light construction, a sort of cushioned divan in the recess of the centre window, a large old chest richly ornamented in colours and gilding, and a couple of recesses with

shelves, on one of which was the invariable set of coffee-cups. Hither flocked, one by one, the feminine members of the household, all attired in gay party-coloured garments and woollen stockings, with dark hair cut short, and hanging down by the side of their rouged cheeks quite straight; smart handkerchiefs twisted round their heads, and earrings. One or two had their eyebrows painted to meet between the eyes, and their nails tipped with henna. They had rather handsome faces, good eyes and hair; but there was only one of them that could be called beautiful, and even her face was devoid of all ennobling expression. They looked good-natured and lively, and extremely glad to see us, though we feared we had taken them by surprise, as they were not arrayed in regular Moorish *grande parure*, though their dresses were very fine and gay. One of them brought a beautiful baby with curling hair of a deep gold colour; and another presented to us a merry little girl about five years old, bagged up like her seniors in full trousers, and with her hair dyed of a peculiar auburn. They pressed us to be seated, some on the divan, some on the carpeted floor; and then tucking their trousered and stockinged legs under them, in a most adroit and convenient manner, they formed, with us, a large social circle, across which they chattered like so many magpies, the English interpreter rendering the questions and answers as fast as she could.

We had brought for them some little presents, consisting of artificial flowers, bonbons, and a pair of English scissors. Those who received the flowers stuck them into their head-dresses, and seemed to be greatly satisfied with them. The scissors were given to an old woman, the mother of one of the husbands, for all relationships seemed represented in this family group. The wife of the cadi was a tall woman, dressed in mourning on account of the death of her mother. She was not so handsome in colouring as the others, but had a more intelligent expression than any one of them. She ordered coffee to be brought, which was served up on a tray, each cup being set in a sort of filigree frame, that served as a saucer. The beverage was most excellent. Our party of thirteen, seated in a circle on the floor drinking it, would have been a sufficiently ludicrous spectacle to a looker-on.

They were highly delighted with our ornaments, and felt the silk of my dress between their fingers. One lady shewed them a Roman brooch with a head of Dante cut in lava; they asked if it was the portrait of her husband!—probably taking the fillet and bay-leaves for some ornamental variety of an Englishman's costume. A little magnifying-glass hanging at a girdle also delighted them extremely. We asked about their education, and were told they could none of them read or write; so that when members of a family are separated by marriage, and live in different towns, they are wholly dependent on chance opportunities of communication through word of mouth of friends. Neither do they know their own ages, usually referring to some public date in order to indicate the limits of their recollection, as 'we remember the coming of the French,' &c.

The life led by these unfortunate creatures is forlorn in its utter absence of moral and intellectual action. They have not only no education, in which they are not wholly singular, but no religion on which to fall back; they have no concern with the ordinances of Mohammedanism; they never enter a mosque except about three times a year; to the graves of the dead they pay occasional visits of reverence; but from all the duties enjoined on Christian women of all ranks, in all persuasions, they are cut off. They can neither teach their children religious truths, for in these they are themselves but half instructed; nor can they take part in charities, for that true religion which visits the widow and

the fatherless can be but ill followed where every movement is fettered by a cruel conventionality.

The Moorish women, however, who are seen in the streets of Algiers, are not of a respectable class. Moorish ladies live in a profound retirement. The houses of the town being built up a very steep ascent, the flat terraces ascend like so many steps; and we read that, until the arrival of the French, it was strictly forbidden any man, under pain of death, to go on to these terraces, lest he should see from thence the women of neighbouring families. The muezzins who ascended the minarets of the mosques several times a day to announce the hours of prayer, had alone the privilege of overlooking the roofs and courts of Algiers; and we are further informed, that pretty good care was taken that these muezzins should be chosen from among the blind! From the terrace of the Casbah, or ancient palace of the deys, we ourselves saw a Moresque come unto her roof, 'hanging out the clothes,' and then a second emerge from another house, and clamber over to the top of an adjoining one, from which she was separated by a low wall, and disappear by a staircase, to pay her respects to her gossip. We were told that the part of the Casbah in which we were, had been appropriated to the women of the dey's family, so that in ancient times no sacrilegious inspection of Algerine privacy could have been perpetrated, though the Casbah is the highest point of the whole town, and looks down from roof to roof, till the eye of the gazer rests on the broad bosom of the blue Mediterranean.

But we are leaving our particular friends, who rejoiced in the sonorous names of Ayesha, Ouria, Toma, Mouna, Gossa, and Haniffa. After an hour of vehement conversation, neither party understanding a word of what the other said, except by help of the good-natured interpreter, and gestures extremely *à propos*, we rose to go, shook hands with each of our entertainers in succession, making altogether a sum of sixty shakes of the hand got through in five minutes, exchanged sixty ejaculations of 'Slama,' and were ushered down stairs, and through the court to the outer hall, passing, as we went, the open door of a saloon, where sat a handsome moustached Moor on his divan, cross-legged, and lazily reading a book. He looked up as we passed, and slightly bowed with a whimsical expression of indolent wonder at the sudden irruption of a bevy of foreign ladies upon the womenkind of his establishment. Such a picture he made in his fez, seen through the arch of the open door, that I could not resist scanning him in what he probably considered an audacious English manner. And so we were bowed and shaken out of the establishment, heartily thankful that we were not born Mussulwomen, nor under the marital or summary penal jurisdiction of a Moorish cad.

THE HEDGEHOG.

The hedgehog is the only representative of the *Erinaceæ* to be found in our latitudes, and his appearance and habits are so entirely different to those of the rest of our Fauna, that he has become surrounded with quite a little group of myths and wonderful stories. Among the ancient Egyptians, and in the Greek and Roman fabulists, we find him the emblem of craft and subtlety. Ælian has much to tell us about his warfare with the foxes, and Aldrorandus devotes many pages to the proverbs and symbolism connected with him. In the rural districts of our own country, he is the subject of many curious superstitions, which cause him to be remorselessly killed wherever he shews himself. His old English name, urchin, was also one of the popular names of

the elves, many of whose attributes were believed to resemble his. The fairies sucked cows as they slept, and so did the hedgehog, and, like them also, he took especial delight in pillaging orchards. Pliny indeed informs us that he climbs up the trees, and after shaking off the choicest apples and pears, tumbles himself down upon them, and runs away with his booty sticking upon his back! but this is either one of Pliny's long-shots, or the idiosyncrasy of some individual Tuscan, for at anyrate it is not the custom of the English species. To hear his cry when one is starting on a journey, is reckoned very unlucky. 'The hedgepig thrice hath whined,' is one of the dismal omens which herald in the caldron-scene in *Macbeth*; and Prospero's spirits, it will be remembered, turned into hedgehogs to annoy Caliban. A little animal possessing such very negative means of defence, would seem to be harmless and pitiable; but, according to our rustics, he is the most astute creature in all creation, not excepting even the fox. The peasantry of Berkshire have a legend about him, in which Reynard plays but a poor figure. A fox and a hedgehog, they say, once disputed which of them was the swifter animal, and agreed to run a race of three heats between two ditches in a large field. The hedgehog, like a cunning old knave as he was, hid his wife in the ditch which was to form the goal, so that when he had made a pretence of starting, she might jump out, and pretend to be himself just arrived. No sooner had the fox cried 'Off!' than Mrs Hedgehog cried 'In!' and directly she had in her turn made a false start back, old Thorny-sides leaped out and said 'In again!' So after three desperate runs, the broken-winded fox, which never perceived the ruse, was compelled to yield, and ever since that day the hedgehog has been his master.

The hedgehog usually takes up his residence in woods or wide double hedgerows, where he can hide away beneath the underwood; but he is perhaps fondest of a little thicket of fern and bracken near a running stream. The best time to meet with him is on a summer evening soon after sunset, for he is then just roused from his day-sleep, and walks out to look after food. You may often see him stealthily creeping along a hedge-bottom, rooting with his long snout among the herbage, and every now and then stopping to crunch, with extra gusto, some delicious *bonne bouche* in the shape of a savoury cockroach or plump earthworm. The moment he sees you, he begins to run; but his awkward legs are not meant for fleetness; and directly he sees there is no chance of escape, he tumbles upon his side, bows his head under his breast, draws in his legs and tail, and in half a second lies at your mercy, a ball of prickles. While in this position, it would be as easy to tear him to pieces, as to pull him open; he resists every effort, and possesses, moreover, a power of elevating and depressing his spines at will, which makes the attempt far from pleasant. So great is the strength and toughness of this covering, that Mr Bell states he has seen a hedgehog in his possession run towards the precipitous wall of an area, and without a moment's hesitation, throw itself off, contracting at the same instant into a ball, in which condition it reached the ground from a height of twelve or fourteen feet, and after a short interval, it would unfold itself, and run off unhurt. The writer has seen them *thrown* from nearly three times this height, without any apparent injury.

For his size, the hedgehog is immensely fierce. He is a great gourmand, and will face almost any danger to please his palate. They are often known to enter poultry-houses, and after driving away the hens, devour the eggs. The young of birds which build their nests near the ground, are eaten by them, and they even attack the snake. This latter fact was often doubted, till Professor Buckland put it to the test by shutting up the two animals together in a

large box. When first introduced, it was not apparent whether the snake recognised his enemy. It did not dart away, but kept creeping gently round the box while the hedgehog lay rolled up, and did not appear to see the intruder. The professor then laid the hedgehog on the snake, with that part of the ball where the head and tail meet, downwards, and touching it. The snake proceeded to crawl; the hedgehog started, opened slightly, and seeing what was under, gave the snake a hard bite, and instantly rolled itself up again. After lying a minute, it opened a second, and again a third time, repeating the bite; and by the third bite, the back of the snake was broken. This done, the hedgehog stood by the snake's side, and passed its whole body successively through its jaws, cracking and breaking it at intervals of half an inch or more, by which operation the snake was quite finished. The hedgehog then placed itself at the tip of his fallen enemy's tail, and began to eat upwards—as one would eat a radish—slowly, but without intermission, till half of him was devoured, and next morning he ate the remainder. A correspondent of *Notes and Queries* gives another instance of their voracity. He tells us that he once enclosed, in three separate hamper, a hedgehog, two starlings, and a wood-pigeon; the lids of each were securely fastened, and they were left in a garden-house all night. Next morning, the strings of all the hampers were severed, and only a few feathers were left of the birds, the hedgehog being found in the wood-pigeon's hamper. With all his hankering after flesh, however, it is pretty clear, from the make of his mouth and teeth, that nature intended him for a vegetarian. 'The manner in which they eat the plantain-roots in my garden,' says White of Selborne, 'is very curious. With their upper mandible, which is much longer than the lower, they bore under the plant, and so eat the root off upwards, leaving the tuft of leaves untouched.' The popular idea, that they suck the cows as they sleep, has been commonly denied by all scientific men; but it still remains an article of the farmers' creed, and they have certainly been found early in the morning in very suspicious vicinity to their udders. In all probability, the notion originated in the fact, that they are attracted to the animal by the smell, and sometimes come in for a share of the milk which may have been squeezed out during sleep.

There is another peculiarity about the hedgehog which is very little known, but, if properly investigated, seems likely to lead to valuable discoveries. No poison of any kind will act upon its system. Pallas gave one a hundred cantharides, which the animal appeared to relish amazingly; while half of one of these acrid insects given to a dog or cat, would cause the most horrible torment. M. Leny caused one to be bitten several times in the throat and tongue by a viper, but without having the slightest effect; and Mr Cuthbert Johnson, the well-known agricultural writer, states that prussic acid, arsenic, opium, and corrosive sublimate, have each been tried upon it without producing the slightest indisposition.

The home of a hedgehog is a curious little structure of moss and dried leaves, and is generally constructed with greater skill than that of any other of the nest-making mammalia. Sometimes he builds it under the shade of a thick furze-bush, or oftener still in the little caves hollowed out by the rain—

Under an oak whose antique root peeps out;

and this perhaps is his favourite den, as it affords him the most protection from the foxes and dogs. The care he takes in rendering his dwelling wind-and-rain proof, has given rise to a popular notion that he is able to foresee changes in the weather, and alters the situation of his house accordingly; hence, in many parts of England, a hedgehog's nest is looked upon as a kind of Murphy's *Almanac*, altogether infallible.

Bodenham, in his *Garden of the Muses*, published in 1600, alludes to this idea in the simile:

As hedgehogs doe foresee ensuing stormes,
So wise men are for fortune still prepared.

Into this hibernaculum, when the nights become chilly, and his food scarce, he betakes himself for his long winter's sleep; first, however, taking care to roll himself up in such a prodigious quantity of moss and dried leaves, that the severest snows will leave him warm and dry. Unlike the rest of the sleepers, he accumulates no provisions. The only store he takes with him is a goodly layer of fat about the viscera and under the skin, which is slowly absorbed, as the waste of his inactive life requires. With the first warm beams of spring he wakes up lean and hungry; and it is said that in this voracious condition he will attack almost anything, and has even been known to break his fast upon a hen.

The disposition of the hedgehog may be very considerably modified by taming. James Douce, the celebrated Dutch scholar, had a pet one which followed him about, and evinced the greatest attachment for his person. When it died, Lipsius immortalised its memory in some Latin verses, almost as rough and unpoetical as the subject. In London, they are much used to destroy the black beetles which abound in the underground kitchens; and many instances are recorded of their becoming familiar with those who treat them kindly. The writer formerly had one who used to know his name 'Spot' very well, and would directly uncoil himself at the sound of his master's voice. He had so far overcome his natural timidity, as to lie before the fire in company with a cat and dog. With the latter, he was on very friendly terms; but the cat and he always regarded each other with mutual aversion. Every now and then, without the slightest provocation, he would suddenly open and bite her leg or tail, and then instantaneously contract himself again with a *Touch-me-if-you-dare* kind of air, which was vastly amusing. This may have been the mere exuberance of hedgehog spirit, but it was a great deal too much like earnest to make it pleasant for pussy, who, however, never ventured to retaliate, for she had probably found that his prickles were more than a match for her claws. She contrived to kitten upon a table, in order that her young should be out of his reach; but one day, during her absence, he climbed up by the leg, and pushed one of them off, and then rolling himself down after it, was proceeding to drag it away by the neck to his hole under the fireplace, when the mother happened to return. Then ensued a battle-royal. Utterly unmindful of her usual caution, the infuriated parent dashed herself three separate times against the enemy, and was each time received with fixed bayonets. Never, probably, was there such an expenditure of spitting and fuming; but all to no purpose, for the hedgehog clung to his prey like a ferret. Had not the writer interfered, and caused the hedgehog to drop the kitten, it would probably have been rent in two between the combatants. The cat was much pricked all over her face and shoulders, and the hedgehog had some ugly scratches under his throat. After this affair, they never lay together on the hearth.

The uses to which the hedgehog has been put are numerous. Among the peasantry on the continent, and in many parts of England, it is used as food to a considerable extent. Hedgehog-dumpling is by no means an uncommon cottage-dinner in Buckinghamshire. The flesh of the young animal is very white, and not unlike rabbit. Among the Romans, the spines were extensively used in carding wool, and several decrees of the senate are extant against the rich wool-staplers, who were in the habit of buying them all up, and thus forestalling the market. In medicine, he was

formerly much used. According to Albertus Magnus, the right eye of a hedgehog fried in oil, and kept in a brass vessel, imparts a virtue to the oil, so that when used as an ointment to the eye, it imparts such a wonderful clearness of vision, as to enable a person to see as well by night as by day! The fat is still believed by our country-folks to be very efficacious in deafness, and many a hedgehog falls a martyr to the delusion.

We were about taking leave of our hero without saying a word about his domestic relations. He chooses his mate early in the spring, and it is said remains constant to her during the season; but they must be very knowing people who can speak positively upon such a delicate subject. She usually produces from two to four at a time. When first born, they are very pretty little animals, with soft white spines and hanging ears. As they approach maturity, the thorns become harder and darker, and the ears become erect.

THE MISER OF MARSEILLE.

MARSEILLE is a city of fountains, and has a fine aqueduct, almost entirely subterranean, by which pure water is brought from the little rivers Huveaume and Juvet. But this was not always the case. Look back with me many, many years, and I will shew you how ill it used to be supplied with water, and how in the fulness of time it came to be otherwise.

Once upon a time—I know not the exact date—there dwelt at Marseille a man named Guyot, with his wife and one son. They were but humble people; and at the time my narrative begins, the child lay sick of a fever, his tongue cleaving to the roof of his mouth, and his little hot hand pressed to his still hotter forehead, while he ceased not to cry in a plaintive tone for a draught of water.

'Alas, my child,' said Madame Guyot, in reply to his moaning, 'you know I have told you already the cistern is empty. Not a drop of water have I in the house, and I fear all our neighbours are as badly off as ourselves. See, take a draught of milk; I have nought else to give you.'

'But, mother, it is not like water,' replied the boy: 'it makes me only the more thirsty, and almost chokes me, it seems so thick; while water is so cold, and refreshes me for a long time. But, alas! you have none to give me. If it would but rain, for I am burning! Oh, if I were rich, I would care little for the finest wines, if I had but plenty of fresh, pure, cold water.'

Madame Guyot, with true maternal love, strove to pacify the young sufferer; and having succeeded in partially relieving his cravings by means of a draught of water, which a kind neighbour, scarcely better off than herself, sent by the hand of her little daughter, he at length slept. Even in his dreams, however, the memory of his feverish longings haunted him; and his plaintive cry for water at oft-recurring intervals brought tears to the mother's eyes; and she trod softly, dreading to awaken the boy, lest by so doing she should also awaken his desires to greater activity, when she knew she was without the means of satisfying them.

Seven years later, and the fever-stricken boy has grown into a fine thoughtful youth of sixteen. No longer dependent on his parents, the young Jacques Guyot cheerfully performed his part in gaining a living. One evening, after his return from work, as Madame Guyot was busily engaged in placing the evening meal on the table, she said to her son: 'Jacques, you must be content with less than your usual quantity of water to-night, for again the cistern is nearly dry.'

'I am sorry for that, mother,' replied Jacques; 'but though we have often since been very scarce of water,

at least we have never wanted it so badly as when I had the fever.'

'O Jacques, can you ever forget that?'

'Never, mother. No day passes, but the torture I suffered then for a draught of water comes into my mind; and I envy no man his wealth in anything save his more abundant supply of that one good gift. Is there no way of relieving this want by which the poor of Marseille suffer so much, and so often?'

'It is just because the poor are those who suffer that they must continue to do so: wealth might remedy the evil,' answered his father.

'How so?' asked Jacques.

'Easily enough. Only let an aqueduct be constructed to bring pure water from a distant river.'

'And what would that cost, think you, father?'

'More money than you could count, my son,' replied the elder Guyot; 'so let us to our supper before it is as cold as the water you are always dreaming about.'

The meal over, Jacques wandered in the garden thoughtful and silent, but not unnoticed by his parents. They conversed together in an undertone about the extraordinary manner in which his mind dwelt on the one night of suffering from thirst so long gone by.

'It is strange,' said Madame Guyot, 'how the lad is always thinking of it. I quite feared to tell him how little water we have left to-night, for it seems to grieve and trouble him so much; not for ourselves alone, but lest some unfortunate should have to bear sufferings like those he experienced seven years ago.'

'Well,' replied the father, 'even that is not the chief object of his anxiety.'

'Why, surely he does not fancy himself in love yet!'

said Madame Guyot in an accent of alarm. 'Our neighbour's daughter, Madeline, casts sheep's eyes at him, I know, young as he is; and Jacques often tells her how like a little angel she seemed to him when her mother made her the bearer of that draught of water. But it is doubtless only nonsense, for he is still a boy, and she a full year younger.'

'I was not thinking of Madeline, wife,' replied Monsieur Guyot: 'in my opinion, Jacques loves something else better than all the little damsels in the world—I mean money. He is always hoarding every sou he can collect, and trying, by all sorts of extra services, to earn more than his daily wages; and I almost fear our son will turn miser, since he spends nothing he can avoid.'

'Oh, if that be the case, he is doubtless thinking of some girl, and trying to save against the time when he is old enough to marry; but he is a good youth,' added Madame Guyot, brushing a tear from her eye at the thought of having a rival in the love of her only child.

'Ah, wife,' said her husband, 'you are almost jealous of little Madeline; but remember, you cannot expect to keep this one lamb of yours always by your side; and I say, that if the thought of having some day to provide for a wife makes the lad so saving, I for one am well content.'

The return of Jacques here stopped the conversation. Hours after his parents were at rest, the youth sat by the lattice in his little chamber. A luxuriant vine hung over the casement, and, waving backwards and forwards in the moonlight, cast fantastic shadows on the wall. Little knew the parents of Jacques by what strong feelings he was actuated, though both were in part right, the father when speaking of his almost miserly habits, the mother in believing that her son loved Madeline.

The youth possessed one of those thoughtful natures which become old too soon; and those who wonder at love in a boy of sixteen, must remember that in southern France the blood runs warmer than in our

foggy island. It was indeed wonderful how he always thought of Madeline in connection with that night of feverish agony—how like a ministering angel the child had seemed in his eyes, when she tripped lightly in with the cooling draught to satisfy his longing. The cup of cold water had worked with a marvellous charm, and the youth regarded the girl with a feeling akin to worship. In the eyes of others, she was just a bright-eyed laughing thing, somewhat wilful and capricious at times, as girls are apt to be; but to poor Jacques she was a being of heavenly beauty.

The recent scarcity of water had again brought the old scene most vividly to his mind, and you might have seen by the moonlight how pale and agitated was his face. After a long vigil, he rose, and taking from a secret repository a sum of money—large for him to possess—he slowly counted it, and then gazing earnestly on his treasure, said softly: 'It might be done in a long lifetime; but, O Madeline, Madeline!' then with tears streaming down his cheeks, he flung himself on his knees to pray. Poor Jacques! he prayed with such earnest simple faith, that he rose tranquil, and seeking his couch, soon fell into a sound sleep.

Three more years went by, and still Jacques continually added to his store. So scrupulous was he in denying himself every superfluity, that the neighbours whispered how the young Guyot had become a miser. Some did more than whisper, they spoke openly to his mother respecting this peculiarity in her son. Madame Guyot looked very sagacious, and gave mysterious hints about the virtue of sparing on one's self to spend on another, glancing as she spoke at Jacques and Madeline, who were just visible to the group of gossips.

Let love be the presumed cause of a man's actions, a woman will hardly ever deem him in the wrong, however extravagant they may be. Even vice in her sight assumes the dignity of virtue, if she can ascribe its committal to the power of love. So it was with the gossips at whose self-constituted tribunal Jacques was tried, and from that time many a sly joke was levelled at Madeline, till the little damsel's head was almost turned by thinking of the—of course much magnified—riches which were hoarded by her admirer for her to spend some day. She felt she was beloved, for it is not hard to divine when one is the dearest of all earthly objects to a pure and honest heart; but in spite of her convictions in this respect, the conduct of Jacques was a sad puzzle to her.

'He is never so happy as when by my side,' she would often say to her mother; 'that any one may see; but I do not think he cares to gain me for a wife.' The mother would bid her be patient, and all would in time turn out well; but Madeline thought there should be some limit to the expected patience, so she would pout her cherry lips, and give Jacques short answers. Still, though she evidently succeeded in giving him pain, he seemed as far from declaring his sentiments as ever.

The crisis, however, came at last. Madeline had a cousin Marie, who was not only a near neighbour, but also a sort of rival beauty. There had been no slight jealousy between the girls on the subjects of love and marriage; but Marie had at last triumphed, and the day for her own wedding being fixed, she openly twitted Madeline about her laggard lover. This was a sad blow to the vanity of the young girl. Marie's fiancé came from what was in those days thought a great distance, and neither grudged spending time nor money in visits to his betrothed; while Madeline, with her lover almost at the door, seemed likely enough to remain single. Oh, it was too much for any maiden's patience.

The wedding-day came, and she of course was one of the guests, together with Jacques; and the girl, bent on punishing her tardy admirer, coquetted with others by his very side. But she did not stop at coquetry

only. The brother of the bridegroom, a gay and handsome fellow, now at Marseille for the first time, was smitten with her charms, and after the wedding, food, or made, many excuses for visiting the town which contained Madeline. Jacques, it seemed, would not be piqued into submission, and she was not inclined either for a spinster's life or a longer silent wooing; so, after some hesitation on the part of her parents, who still leaned to their young neighbour, partly from old association, and still more because of his repeated wealth, Madeline was betrothed to the stranger.

Madame Guyot often sighed, and said in her son's hearing that it was a pity two of the prettiest maidens in Marseille should be carried off by strangers: for she had long since made up her mind, that since Jacques would needs marry soon or late, it would be well to have a daughter-in-law whom she had known from babyhood. All her hints might have been unheard, for any outward effect they produced on her son; but when the marriage-day came, he remained shut up in his little chamber. Neither food nor drink passed his lips; but could he have been seen by any one, a mighty mental conflict would have been revealed to the watcher—it was the last great struggle with human passion. The last bar to his devoting himself to one great object was removed.

The gossips who had aforetime interested themselves so liberally in the affairs of Jacques and Madeline, once more twitted Madame Guyot, saying, it plainly was not love that made her son such a miser in his habits; but she answered them more proudly than ever, that Jacques would now look higher for a wife.

So, first one great lady and then another was said to be the fair object for whom our hero cherished a secret passion, and whom he was trying to equal in wealth. But though Madame Guyot fostered the idea, she, poor soul, knew better; for only a few days after the marriage of his one love, Jacques had begged her, in a broken voice, to find out whether the little vessel in which Madeline had borne the precious draught of water to his bedside, a dozen long years ago, were still in existence.

'O my son,' said Madame Guyot, 'since you did so love Madeline, why did you let her go? She would not now be the wife of a stranger, if you had asked her for thyself.'

'Better as it is, mother,' replied Jacques, though his lip quivered while he spoke, and again begged his mother to procure what he had mentioned, at any cost.

Madame Guyot's mission proved successful, though the mother of Madeline marvelled greatly at the request; and both the worthy matrons agreed that the conduct of Jacques was a problem beyond their power to solve. Eagerly was the little vessel seized by him, and after bestowing many grateful thanks on his mother, he conveyed it to his own little room. Could the thing of clay have spoken, it might have told how, when others slept, Jacques spent many an hour in sighs, and even tears. Ay, for every drop of water it had once held, the strong man paid in tears a thousandfold.

Years sped on, and the father and mother of Jacques passed from the earth. The young man had been called a miser, even during their lifetime, but now, indeed, he merited the title. Ever craving for money, he added to his store by the strictest parsimony. His clothes were patched by himself again and again, till no traces of the original stuff remained. Generally his feet were bare, and even when he wore any covering on them, it consisted of old shoes which had been cast away as worthless, and picked up by him in his solitary wanderings through the town. His food was of the coarsest description, and taken simply to sustain life. He no longer occupied the dwelling in which his early days had been

spent; his present home was an old and roomy house, built with a degree of strength which defied any attempt at entrance, unsanctioned by the will of its occupant; at least without a degree of force being used, which must inevitably have led to discovery. Here, then, dwelt Jacques Guyot quite alone. But far worse than alone was he when absent from his house, for the evil repute in which he was held was such, that as he walked, the little children ran shouting after him: 'There goes Guyot. See the wretched miser, how thin he is! He grudges himself food to make himself fat, and clothes to cover his lean old body.' Then the mischievous urchins would cast stones at Jacques, and load him with insults, unchecked by their parents. But even this was not the worst. One day he met a friend, or at least he had been such in youth, and whom he had not seen for many a long year. For the moment, Jacques forgot his rage and his isolation—it was so long since a kindly word had been bestowed on him, and oh! how he yearned to win it. Eagerly he advanced, with an indescribable gleam of joy lighting his pinched features; but his former comrade shrank back, holding up his hands, as if to forbid his nearer approach, saying, as he did so: 'I will not hold communion with a thing like you. Did you not love thy money better than her who ought to be your wife? but you suffered a stranger to carry her away, and now the accursed thing is dearer to you than yourself, though you have neither child nor kin to whom to leave it. Away! touch me not!'

Another trial came still later, and it was the hardest of all. A portly dame, elderly, but still fresh and comely-looking, and with a fair daughter by her side, passed leisurely along the streets of Marseille. They seemed to be new arrivals; but the elder one was evidently no stranger, for she pointed out to her daughter various changes which had been made of late. Jacques Guyot looked earnestly at the girl, for her features brought vividly to his mind those of the object of his one love-dream, and as he came near, he heard her mother call her Madeline. Another glance, and he recognised the elder female as the Madeline of his youth. Though so many years had gone over his head, his pale face was in a moment flushed. Again he forgot the curses and the stones daily showered around him; the vision of the bright-eyed child, with the little treasured pitcher in her hand was before him, and he too was for an instant young; but for how brief an instant! Madeline, even in her distant home, had heard of the miser Guyot, who heaped up wealth, though with none to share it, and denied even the smallest aid to the miserable, though surrounded with gold. Even at that moment, too, she heard the taunts of the passers-by; so, gathering her skirts closely around her, as though the very touch would poison, she swept by with such a look of scorn as rooted the miser to the spot, and brought back the sense of his loneliness more terribly than ever.

Though no inhabitant of Marseille ever entered the miser's dwelling during his life, yet I am able to tell how he spent his time there. I know he never entered his silent, comfortless home without feeling that his heart would leap with joy to hear a friendly voice, or if he might be permitted to clasp a child to his bosom. I know that, in spite of insults, reproaches, and taunts, his heart teemed with loving-kindness to his fellow-creatures, and often when suffering from them, he would even smile, and murmur: 'It is because they know me not; for one day these curses will be turned to blessings.' Ay, and that, when seated on his hard bench, to take the food needful to prolong his life until the object should be accomplished for which he had given up all that could tend to its enjoyment, he prayed for a blessing on his coarse fare; and I know, too, that after each more biting proof of scorn

from those around him, he asked from the same Almighty source strength to 'endure to the end.'

A very old man was Jacques Guyot when the end came, but he met it with joy and hope, for he had lived long enough to finish his self-imposed task. Stretched upon his wretched pallet, he smiled and talked to himself. 'Ah, Jacques,' said he, 'they will never more call thee accursed. The last stone has been cast at thy worthless carcass, for worthless it may well be called, since even the worms will scarcely be able to banquet on the scanty covering of thy old bones. But, oh, what joy to think the miser has not lived in vain! And thou, too,' said he, taking in his hand Madeline's little pitcher, 'well hast thou performed thy part. Though but a thing of clay, the sight of thee has reminded me each day and hour that, having given up her to whom thou didst once belong, no greater sacrifice could be demanded from me; and more than that—it ever brought before me the memory of the one pressing want which inspired the resolution God has in his goodness given me strength to fulfil. I will indulge just one weakness, and having taken my last draught from thee, no other lip shall touch thee.' So saying, he drank the water it contained, and gathering all his remaining strength, shivered it to atoms. One hour after, and the miser lay dead. Only lifeless clay, senseless as that shivered by his last act, now remained of Jacques Guyot.

As soon as he was missed from his daily haunts, the propriety of examining his dwelling suggested itself to the towns-people, for there were many who would not touch him while living, who would gladly have acted as his executors. Fancy, then, the crowd around the door—the forcible entrance—the curious ransacking each room till they at last stood beside all that remained of the object of their bitter loathing. The authorities of the town, who led the way, took possession of a sealed paper, which Jacques, ere he lay down to die, had placed in a conspicuous position. It was his will, duly executed, and contained these words: 'Having observed from my youth that the poor of Marseille are ill supplied with water, which can be procured for them only at a great cost, I have cheerfully laboured all my life to gain them this great blessing, and I bequeath all I possess to be spent in building an aqueduct for their use.'

Jacques had told the truth. The curses turned into blessings, and his death made a city full of self-reproaching mourners. Many a man has won the name of hero by one gallant deed; but he who made a conquest of a city by the continued heroism of a long life, methinks deserves the name indeed. And thus I have told you to whom the inhabitants of Marseille owe their aqueduct.

SEDENTARY OCCUPATIONS.

HEALTH is the greatest of earthly blessings: with health a peasant may be rich, for he may be content; and without it, a Cæsar may be miserable in the midst of his gold. And yet this inestimable gift is daily and hourly flung away, as if, like money, it was of use only when spent; or as if its preservation was not worth the cost of a little reflection and self-denial. It is our purpose hereafter to bring before the readers of this *Journal* some plain and simple observations relating to the preservation of health; but we would now attempt to explain, in a popular way, why sedentary employments are so generally injurious, and to offer some suggestions, by attending to which, our sedentary brethren may avoid in a great degree the mischievous consequences now too often found attending their pursuits.

Health depends mainly on three essential conditions—sufficient nutriment, pure air, and a uniform flow and circulation of the blood throughout the entire

system. Experience amply proves that vegetable food will sustain the human frame in strength and vigour. Beyond a certain point, it is not so much *what* we eat, as our power of digesting and assimilating it, on which our physical strength depends. As regards food and air, we are, most of us, dependent on circumstances; and we shall presume that those for whom we write eat such wholesome food as they can procure, breathe the air such as they find it, and can exercise no great power of choice in either of these particulars. It is, then, to the *third* condition of health—namely, a regular and equable flow of blood to every part of the system—that we shall chiefly confine ourselves, because sedentary occupations interfere directly with this condition; and much may be done, by a little care and forethought, to counteract their injurious tendency.

Man is naturally calculated to sustain, when in health, severe and continuous labour. This, his natural condition, provides for the uniform circulation of which we speak; but when he spends the greater part of his time in bodily inaction, and more especially when at the same time his *mind* is at work, then, in two different ways, the great rule of health is violated.

It is an ascertained fact, that when any portion of the animal economy is called into action, it is subjected to immediate *waste*, and requires an immediate succour in the form of an increased supply of the vital fluid. Thus, the engagement of the eyes and brain in sedentary pursuits, tends directly to that state of fulness in the blood-vessels of the head, which, when in excess, is called *congestion*, and becomes a most dangerous, and too often fatal malady. We say 'in excess,' because, upon the principles just now laid down, an extra flow of blood to those parts is necessary at certain times, and it rests with ourselves to keep it within proper bounds.

Now, if we take a healthy man, after half an hour's moderate exercise in the open air, as a type of the human frame in its best state, we shall find that the large muscular lower limbs are receiving—are, in fact, at any given moment in possession of—a very large proportion of his blood. Such is by no means the case when the same person has been sitting a couple of hours at a table or desk, especially if exposed to a low temperature. This blood must flow somewhere; and a good deal of it goes to the head—not only what is necessary, as we have supposed—but more than that, and thus a tendency to congestion is established.

If all which is withdrawn from the lower limbs crowded at once to the head, the consequences would be immediately fatal, as apoplexy or paralysis would be thereby induced. But nature takes means to prevent this, and the internal organs have their share of the superfluity. They are thus 'engorged' and oppressed, and a tendency to disease is engendered in them also. Such are the effects of those conditions of body in which the equable flow of the circulation through every part alike is compromised.

The great object, then, should be the maintenance of the desirable state of *equilibrium* which we have supposed above; and failing that, we should aim at as near an approach to it as it is possible to attain. For these ends, it will be well to attend to the following simple rules:

Avoid study as much as you can during the first periods of digestion. The eyes and stomach are both supplied with nerves from the same branch, and the employment of the eyes in reading or writing soon after eating deranges digestion, and throws the whole system out of gear. All who transgress this law, will have a reckoning to pay sooner or later. Avoid the sitting posture as much as possible. This may be done by using a standing-desk for reading and writing, and transferring your work to it now and then. If this cannot be done, get up occasionally, and take a few turns up and down the room; or even stand up and sit down again. If your feet are cold, let your walk

be on the toes—*springing* on them, as is done in dancing—a most excellent winter exercise for the sedentary. If need be, wrap your feet and legs in some warm garment when you resume your seat: an old cloak or dressing-gown will do. It is far better to use a hot-water footstool—anything rather than *submit* to cold feet. You may as well expect to live without air or food, as to enjoy health unless you can contrive to counteract a tendency to cold feet, if you are unfortunate enough to suffer from it.

Never imagine that you are doing yourself justice, if you do not walk as much each day as can be done without absolute fatigue. What this may be, will vary according to age, state of health, &c.; but, as a rule, it may be laid down, that a slight feeling of lassitude is about the best measure you can have. The healthy will only increase their debility by attempting long 'constitutional walks' beyond their power, and without proper training. Great mistakes are made here by young men in their summer excursions, from which they often return with the seeds of jaundice and fever lurking in their constitutions, in consequence of overheating, chilling, and over-exertion.

Sedentary persons should feed moderately, and avoid fermented liquors as much as possible, especially if of a naturally sanguineous temperament. Those who are naturally pallid and dyspeptic should use a more generous diet, eating a moderate quantity at each repast, and above all things, avoiding that disturbance of the digestive process which is the result of application to study soon after eating. An excellent drink for such persons is bitter beer with a dash of soda-water into it, in the proportion of about 'half-and-half.'

This is by no means a complete system; but it contains nothing which may not be profitably put in practice by the sedentary. They should also avoid small print in reading, small hand in writing, and insufficient or too glaring light at all times.

ARTIFICER-SOLDIERS.

THE Royal Sappers and Miners have now merged into the corps of Royal Engineers. When this useful and distinguished branch of the service was first formed, it consisted of only sixty-eight men, under the designation of the Soldier-artificer Company. In 1812, when the name of the corps was changed to that of the Royal Sappers and Miners, it numbered about 8000 men; and in 1856, when the Sappers ceased to be distinguished from the Engineers, their total force was over 4000. Up to the latter date, the corps was officered by the Engineers, and was, latterly, divided into thirty-two companies, of which twenty-eight were devoted to general service, four being set aside for the national surveys. There was also a small troop of drivers attached to the corps. About two years ago, we drew attention to the remarkable history of these military artificers, written by one of themselves—Mr Connolly, now quarter-master of the Engineers. Mr Connolly's work was *sui generis*—a picturesque biographical history, setting forth the leading incidents in the lives of the different members of the corps, with singular impartiality, privates coming in for mention equally with their superiors. The work seems to have proved the success which its merits entitled its writer to expect; and we have it now before us in a second edition, with considerable additions, including minute details of the various operations in which the Sappers were engaged in the Crimea, as well as some fresh notes on the achievements of the survey-companies.

In the Crimea the corps had constantly to work under the fire of the enemy. Read this account of the formation of the double sap between the two

foremost parallels on the left attack: 'Not without great toil and watching was it completed. In aspect, it bore a wild crenated outline, as if the miners, in struggling to make a direct approach, were so oppressed with difficulties, that, defying the energy and capacity of art, they were forced to make progress by running into sidings and notches. The last gabion to connect the sap with the parallel was fixed by Corporal Lendrim. The whole way was broken up by mining, and the planting of every gabion was attended with imminent risk. Stones blown from the rock were built into the parapets and compacted with earth and clay thrown among the blocks from sacks and bread-bags. So fierce at times was the firing, and so clear the moon, that the extension of the trench throughout an anxious night was confined to the placement of only four gabions. Some nights the sap was pushed ahead as much as ten yards, which was regarded as an exemplary effort. "For every three gabions fixed during the night, two were knocked down at daylight by round shot;" and not unfrequently one has been struck from the hands of the sapper essaying to stake it. Such gaps and such violence sufficiently mark the trials of the undertaking, and account for its slow and wearying progress. Up to the close of the siege, the sap demanded the labour and vigilance of small parties to patch up the broken revetments and replace the shattered gabions.' It fared no better with them in the sap near the Cemetery: 'One night, at this sap, Corporal Henry T. Stredwick had with him a half brigade of Sappers who were tasked to lodge and fill eighteen gabions; but the moment they began to work, a galling array of heavy projectiles opposed every foot of progress. Repeatedly the gabions were capized: full ones on two or three occasions were blown from the trace, and the Sappers knocked over and buried under them. Even resolute men would have had ample excuse for abandoning so murderous a spot; but, regarding nothing as insuperable or too hot, the Sappers held obstinately to the work, and succeeded in lengthening the trench by twelve gabions.'

The Quarries was a fatal spot to the Sappers; it was there that Sergeant Wilson, a man of no common merit, lost his life. 'Two old acquaintances who had not met for years, chanced in the early night, as the darkness was falling, to recognise each other in the Quarries. Each grasped the other's hand, and while engaged in an animated greeting, with the warm smile of welcome on their lips, a round-shot struck off both their heads! The friends were Sergeants William Wilson of the corps and Morrison of the Royal Artillery. A genuine Scotchman was Wilson, with an accent as provincial as a Highlander. Thick-set, well knit, and athletic, he was formed for the hardships of labour. His composure under fire was remarkable; of danger, he knew nothing. Among detachments of the corps, he was the spirit of the trench, and moved about the lines and batteries with the same air of tranquillity as in a workshop. As a sapper, few were more excellent, few more apt and bold in situations of difficulty, peril, and surprise than he. Throughout the siege, he scarcely ever missed his turn in the front. If counted up, it would be found there were not many in the corps who had passed as many months in the trenches as Wilson. Safe and reliable, he was greatly in requisition by his officers. When new approaches were to be opened or new batteries constructed, Wilson, if not more importantly employed, was mostly deputed to start them. Indeed, of the execution of many he had the charge, and the tact he exercised in the arrangement of his working-parties was something extraordinary. For many weeks of the concluding operations, he was rarely away from the trenches; and had he lived, his brilliant services would have put him in the possession of the highest honours it belonged to his class to wear.'

"I regret much," wrote Lieutenant-colonel Chapman to Sir Harry Jones, on the 6th, "to have to report that Sergeant Wilson, of the first company Royal Sappers and Miners, was killed in the Quarries by a round-shot yesterday evening. Frequently commended, and not long ago promoted for his distinguished conduct during the progress of the siege, this excellent sergeant of Sappers has earned the esteem, not only of three successive directors of the right attack, but also of every officer under whom he has done duty. Always ready for whatever he might be called upon in the severe weather of last winter; ever foremost at the point of danger, he has left to the young soldiers of the corps an example of devotion to the service which they may do well to emulate."

Corporal John Ross would appear to be one of the most distinguished of the corps. He was several times during the siege specially singled out for reward by the commander-in-chief, and it was he who discovered and was the first to announce the abandonment of the Redan by the Russians. These pages contain many instances of his kindness, skill, and valour.

It is impossible to make our quotations reflect in any degree faithfully the quality of Mr Connolly's book; but before closing it, we must draw attention to the services of the survey-companies. 'The four survey-companies,' says Mr Connolly, 'are engaged in completing the secondary and minor triangulation of Great Britain; the detail-survey and contouring of Scotland and the four northern counties of England, and the revision and contouring of the northern counties of Ireland. Occasionally, they carry on special surveys for the government; execute similar work for sanitary purposes for local boards of health, and make surveys of particular towns, parishes, and manorial estates—for municipal service or proprietary record and reference—at the expense of local corporations or of private noblemen and gentlemen. Small parties have at times been employed in making tidal observations for investigating the theory of the tides and for other scientific uses, and also in gleanings much subsidiary information, to be embodied in the Ordnance Memoir of the Survey, should it at a future day be published. In Ireland, the companies did excellent service in collecting various statistical details, and gathering minerals, fossils, and objects of natural history, to assist in developing the investigations of those interesting subjects. In conducting the survey of Great Britain, however, that branch of the duty has been abandoned.'

One cannot read of these companies without surprise at the superior accomplishments of their sergeants. Here is a short notice of Sergeant-major Steel: 'As a mathematician, he holds a fair reputation for proficiency and accuracy; but it is chiefly with the work of the triangulation and astronomy he has most distinguished himself. His early service was passed on severe hill-duty. Ben Anler and Creach Ben were his first mountain-stations. . . . At Creach Ben he learned the use of the instrument, and succeeded Lieutenant Hamley, R.E., in its charge in 1841. He is the first non-commissioned officer of the corps who used one of the larger instruments. In prosecuting his new trust, his travels embraced all parts of the British isles. Now, he would have his station on the mountain-top—now on some craggy peak, and anon staged on the tower of some majestic castle or cathedral. This, again, he would leave for service on some stormy coast, or to perch his observatory on the slender weather-worn spire of some quiet village or city church. At Norwich Cathedral, his observatory rested on a scaffolding 315 feet from the floor of the building—nearly the height of St Paul's—but without the advantage of a dome at the base, to diminish the apparent distance of the observer from the ground. Here he used to creep into

the nest through a hole in its floor. Some of the men were weeks before they could reach the top, while it was the duty of Sergeant Steel and others to ascend it, and carry on the work in the most tempestuous weather and in the darkest nights. The oscillations of the structure were frequently very violent; but the observer, cool and fearless, continued to complete his arcs, and to record the movements of the stars. In one of the storms which broke over Norwich, an architect paid the sergeant a visit; but the vibration of the nest appeared so alarming to him, that, through his representation, a peremptory order was given to abandon the station, by removing the instrument and scaffolding from the spire. At Beachy Head, the sergeant spent a winter season, where he was exposed to cold the bitterest he had ever experienced. This was in March 1845; and at midnight, when the temperature was 25 degrees below freezing-point, he did not forsake his work, but continued to observe the elongations of the pole-star, protected only by the canvas sides of his frail observatory. In moving from place to place, he acquired much skill and facility in the construction of scaffolding and stages; and some of these fabrics, from his own designs, have only, perhaps, been excelled by the interesting works of Sergeant Beaton. Soon after this, Sergeant Steel was employed during periods of five years in carrying on a series of astronomical observations with Airy's zenith sector for the determination of the latitude of various trigonometrical stations used in the Ordnance survey of the British isles. Out of the twenty-six sector stations, he visited seventeen, at fifteen of which he took the whole of the observations, with the exception of a few at Balta, and about one-half at Southampton, which were made by Corporal William Jenkins. The record of his observations, comprising about 700 quarto pages of closely printed matter, attests both his industry under difficulties and his talents. In this honourable service, he displayed a quickness of perception, an accuracy in the manipulation of his instrument, and a skill and dexterity in the taking and registration of his observations, that place him in an enviable light even among scientific men. The most important work with which the name of Sergeant Steel is popularly associated, is the triangulation of London for the Sewers' Commissioners. He it was who designed the beautiful scaffolding around and above the ball-and-cross of St Paul's, and who for four months carried on his duties in the observatory, cradled above the cross, with so much spirit and zeal, notwithstanding at times its alarming oscillations. In that period, he made between 8000 and 10,000 observations, and, on the completion of the service, superintended the removal of the scaffolding, which was found to be an operation even more difficult and hazardous than its erection. Another important work superintended by him, was the re-measurement of the base-line on Salisbury Plain by means of the compensation-apparatus, which he conducted with his accustomed fidelity. This is the Mr Steel who, in 1855, furnished the British Association with 850 determinations of latitudes and theodolite observations from Arthur's Seat, with the view of determining the attraction of that mountain.

Quarter-master William Young is also a man of marked ability. For fifteen years, he superintended a large force of computers and others, employed in carrying out the various calculations for the principal, secondary, and minor triangulation, the preparation of diagrams, the calculations of latitudes, longitudes, and meridional bearings, also the computation of distances and positions for the hydrographical office, to enable the Admiralty to project the nautical surveys of the coast of the United Kingdom. With these scientific duties was connected the computation of trigonometrical and meridional and parallel distances for the surveys and large plans of towns. . . . For some years

Mr Young superintended, under an officer of engineers, the compilation and calculations for the publication of the grand triangulation of the United Kingdom, and the arcs of the meridian connected with it. In addition to these scientific duties, he had charge of an official correspondence, and the management of large public accounts, the magnitude of which may be judged by the fact, that in four years alone more than L.100,000 passed through his hands—L.50,000 at least in personal payments, and the remainder in issues through him, to other persons rendering their accounts to him for examination. This brief abstract affords sufficient evidence of the extent and responsibility of his duties, which, Colonel Hall reported, "could only have been performed, in the highly efficient manner in which they had been, by the possession on his part of great mathematical knowledge and aptitude for applied sciences." In some respects to compensate him for his services, he had, when a non-commissioned officer, been awarded the highest military rewards and allowances that the regulations permitted—namely, 4s. a day and an annuity of L.10 a year and a silver medal. These, with his sergeant-major's pay, made his annual allowances reach about L.170 a year, exclusive of his regimental advantages of excellent quarters, fuel, and clothing. Even this, the ultimate stretch of military reward, was wholly incommensurate with his acquisitions and deserts; and to retain his services in the department, it became necessary that a special commission should be taken to better his station in the corps. This was successful; and by the cordial and generous advocacy of Sir John Burgoyne, a commission was obtained for him to the rank of quarter-master, by which he is placed, in a pecuniary view, in a position above the chief civil gentlemen on the survey, and on a par nearly with the lieutenants of engineers employed on it.

Who would think of romance in connection with the subject of triangulation? And yet, what between living upon mountain-tops and on high scaffolding-airy perches, difficult of erection, and never visited without the sense of insecurity—the surveying engineer is constantly in the way of adventures. Mr Combes says, in writing of Sergeant James Beaton: 'Throughout his survey-career of more than twenty-three years his adventures and vicissitudes on mountain-tops, observing, in scaffold-building, in travels by land and sea, exposed in camp to frost and snow, to violent winds, storms, and deluging tempests, belong almost to the romance of science. This is true not only with respect to the arduous and trying services of Sergeant Beaton, but to many others who, like him, have been allotted to the laborious duty of the great triangulation.'

UNDER THE LIMES.

BY THE LATE MAJOR CALDER CAMPBELL

As there I stood beneath the flowering limes,
Whose golden blossoms waved above my head—
A fragrant orchestra, where hymns were said
In musical intonements and rich chimes
By myriad bees—I saw, as distant climes
Are visible in dreams, a lady laid
Upon the opposite bank, where black yews made
A darkness that benighted sun and air—
Strange contrast with the brightness round me cast!
But oh! the beauty of that face divine,
Where rose and lily did such tints combine
As my tree-odour and sunshine surpassed!
So brightly shone her clouds of golden hair.
That—spite of all the shade—there was no shadow there.

TRAVELLING COMPANIONS.

CERTAINLY do meet with odd people on my travels, though these are neither numerous nor extensive. I have never passed the bounds of—speaking Hibernicé—my three native countries; yet within England, Scotland, and Ireland I have met with characters enough to set up a modern Sentimental Journey; and read little bits of histories, full of nature, feeling, or humour, that would furnish studies for the greatest novel-writer of the day. Most of these I have lighted upon in railway-carriages—places fruitful in episodes to one who generally travels second-class and lone.

Yes, in this slowly deteriorating world, we may well begin to fear that clothes and purses do not confer that unquestionable respectability which it is generally supposed they do; else why, in spite of silk gowns, unexceptionable broadcloth, and no lunch in a basket, is an ingenious avoidance of Wolverton, Swindon, &c., can first-class never trust itself to itself, it must stare in mute investigation of its own merits and position till within a county or so of its terminus, when repentance and satisfied gentility come quite too late? Now, second-class, whose only passport is its face, and only safe-conduct its civil behaviour, has no such qualms, but plunges at once *medias res*, settles itself to the evident duties of humanity *in transitu*, and reaps corresponding benefits. Nature certainly meant me for a second-class passenger. I cannot help taking a vivid interest in everything and everybody around me. Convinced that

The proper study of mankind is man,

as woman, as it happens, I suffer no little impediments to daunt me, and succumb to none of those slight annoyances, which are grave evils to persons of sensitive organisation. To be sure, it was an inconvenience to be thrust into the carriage with those two young couples, married that morning, and bound for Australia next day, especially when the one husband, half-sea-sick, would balance sleepily between the corner and his wife's shoulder, and the other wife chattered the most coquettish nonsense to the other husband. Still, each of the opposite partners, I could trace a quiet sturdy seriousness, which led me to moralise on the future fate of all four, and even to see a wise meaning in the dispensation of matrimony, morally as well as physically, coupling opposite faults and opposite virtues. Also, on that terrible incursion of the Goths, the shape of six big labourers, accompanied by the unmistakable fustian odour, all brutish and stupid, and only one fierce with his wrong in having the

next carriage closed in his face by a 'gentleman'; how the man kept looking at his crushed bleeding finger, and muttering savagely: 'He'd none ha' done it, if I'd had a good coat on my back!' Even among these it was interesting to watch the care with which three or four of them guarded each a branch of white sloe-blossom, to brighten some wretched London attic—the train was going to London; and it was more than interesting—even touching, if it had not been so lamentable in its indications—to see the blank gaze of sullen wonder with which the man with the hurt finger stared at me when I asked the simple civil question, in the commonly civil tone which we English are apt to think it lowers our dignity to use to any but our equals, 'if he disliked having the window open?' He made not the smallest reply—he only stared. Poor fellow! I wonder whether, in lavishing abuse on the boorishness of the British peasant, it ever crosses the superior British mind to try the novel system of teaching inferiors politeness *by example*?

But I am wandering from the companions who amused and occupied me during a day's journey last week, and who unconsciously suggested this article. Honest folk! I daresay it never struck their simple imaginations that they were decided 'characters,' or that 'a chiel' in the corner was 'takin' notes' of their various peculiarities.

It was a double carriage, meant for sixteen, and nearly full. Various comings and goings took place the first hour, which I scarcely observed, till finally waking up out of thought, and feeling that one must take an interest in something, my mind centered itself in the other compartment on a row of black curls, slightly marked with gray, under a sailor-like sort of cap, and above a very nautical pair of shoulders. Shortly, an unmistakably nautical voice, seasoned with a slight foreign, or, as I afterwards discovered, Jersey accent, made itself heard through the clatter of tongues at their end of the carriage and the quiet silence of ours.—We were three women in black, myself, and a gentleman, who looked like a clergyman.

The black curls shook, and the brawny hands gesticulated more and more, in the enthusiasm of description to some passenger opposite. Shortly I saw that the whole compartment, and even those in our own who could hear, were absorbed in attending to our maritime friend.

'When I was becalmed off the Isle of France'—'When I commanded the So-and-so, trading with the West Indies'—'When we ran ashore off the coast of Guinea'—these and similar phrases reached us—small fragments of conversation, and casual allusions to

stray corners in every quarter of the globe, which at once arrest the attention and admiration of us islanders. Truly, if we have a weakness, it is for those who traffic upon the deep waters. The sea-captain was, I saw, fast becoming the hero of the carriage.

I could only see his black curls; but I was amused by the face opposite to him—fat, fair, and forty—thoroughly English, and set off in thoroughly English taste by yellow flowers inside a bright-red bonnet: bourgeoisie to the core. She might have never trod beyond the safe pavement of some snug provincial town, save when once—for she wore a bracelet that I felt sure was bought at the Crystal Palace—dragged up to London to bring down to admiring neighbours her report of its wonders. A comfortable, jolly, impassive face, which listened with a sort of patronising smile, I thought, to the wonders of the deep, as detailed by the sailor. I never was more astonished in my life than when, in a pause of the anecdote—it was some attack at sea—Mrs Red-bonnet observed in the quietest drawl:

'Yes, they thought the bursting o' that cannon would ha' killed him; but I just laid him down on a table in the cabin, and I plastered his face all over with wadding, and cut two holes for his eyes, and he got well somehow. There beant no particular scar left—eh? You see?' Appealing to the carriage generally, as a mild recognition of her personal property in the aforesaid black curls and broad shoulders, which nodded acquiescence.

'Ay, ay—they'd have finished me, more than once, but for her there.'

'Her' smiled; and in the aforesaid meek drawl continued: 'Yes, we'd some bad business in that nigger trade. Do you remember the blackie that was nigh killing you asleep in the cabin?—only I happened to come in, and stuck a sword into him. I helped to throw the other three black rascals overboard; I was a strong woman then.'

And the lazy blue eyes drooped, and the fat cheeks smiled, in amiable deprecation; while the whole carriage looked with amazed curiosity at this middle-aged matronly Thalestris that we had got among us.

'Ay, ay—my wife's right,' said the sea-captain, who thereupon subsided a little, and left his better-half to give tongue, which she did pretty freely, telling in that languid dolorous voice the most unaccountable stories of niggers running away—'So I just thought I'd put a musket to his back'—of niggers trying to assassinate her, when her husband lay sick—'but I just had a horsewhip in my hand, and I gave it him till he howled for mercy: you must get the upper hand of these blackies, or they'll get the upper hand of you.' Or else tales of shipwrecks, disasters, illnesses of the captain—'But oh, bless you, the crew always minded me; they knew I could command the ship almost as well as him.' All of which the captain lazily confirmed with his gruff 'Ay, ay;' he evidently had long ceased to consider his wife as at all a remarkable personage.

Not so her present audience. More than one smile arose of amused incredulity—but always, I noticed, behind the black head and its curls. And fat and rosy as the face was, I could trace a certain cold hardness in the blue eyes, a squareness of jaw, and merciless rigidity of mouth, which made me feel that—comfortable as she looked—on the whole I had rather not have been one of the 'rascally niggers' who offended Mrs Red-bonnet.

Various turns her conversation took, from these 'raw-head-and-bloody-bones' anecdotes—some of which I really, for the sake of womanhood, had rather not put down—to little episodes in the domestic history of 'a poll-parrot, whom I took out of the nest, and now he speaks three languages—I declare

he does; and for sense and fondness he's just as good as a child.' Then, in answer to a question—with a momentary shadow over the round face—'No, sir; we have got no children.' Poor Red-bonnet! perhaps otherwise she would not have 'put a musket into the back' of an unlucky blackamoor, who must once have been mother's son to somebody.

Human nature is weak, especially female nature. It can resist an attack of pirates much easier than the petty vanity of telling the story afterwards, with every addition possible, for the entertainment of a railway-carriage. In ours, the masculine tongue stopped entirely—reposed on the glory of adventures passed through—or only now and then dropped a gruff word in true man-fashion, as if when a thing was once done, it was a great 'bother' afterwards to be obliged to talk about it.

Not so the better-half. The captain's wife chattered on, at the rate of nine knots an hour; till the three decent bodies in black, who sat by me, cast doubtful looks at one another, and up to the carriage roof, in that mild pharisaical style of thankful self-gratulation; all even the pale young clergyman turned his quiet head half over the compartment, listening with an air half shocked, half-compassionate, to these apocryphal tales of slave-stealing off the African coast, and accidental butcheries on the Chinese seas, told with as much coolness as if the offending Malays had been Codd's China fowls.

I had noticed the parson's head before. It was one of those that you will frequently find in English country pulpits—pale, fair-haired, with features so delicately cut, and woman-like, in short, that you instinctively think, 'That man must be very like his mother.' There was great firmness in it—the sort of firmness you never see but in fair people—mild, and not aggressive, yet capable of resistance to the death. The head square and high, and made higher still by a slight baldness, seemed to occupy two-thirds of the head. Intellect, power of work, patience, perseverance—on a certain sweet kindliness, were all there—and something else, which, alas! you too often see in English country clergymen: a narrowness, a placid assurance of infallible right—the only possible right being that which the assessor held—a still, cold, unimpassioned satisfied air, to which belief had only one phase, and that was the particular phase in which its devotee saw it. The Thirty-nine Articles were written in his face—everything beside them or beyond them being heretical or impossible.

At least, this was the impression he gave me; a false one, and the reverend unknown should send me his paper, I here humbly demand his pardon. For it was true to his profession, which was more than I was; for I confess to an involuntary smile when shooting her arrow abroad, it might be at random, it might not, Mrs Red-bonnet thus broke out:

'Yes, it's all very fine to talk about savages; but my part, I should like to tell the people at home of what I know about the missionaries that turn to Lor' bless ye! I wouldn't give a penny to a missionary box! I've seen 'em abroad. They're all a lot. They just learn a few little black boys their letters, and then they go up country and enjy themselves. I knows their ways! Of all the humbugs on earth there's not a bigger humbug than a missionary.'

More than one pair of eyes glanced towards the clergyman. He sat motionless, his thin lips almost into a straight line; a pale red complexion, cheek, and faded away again; but he never moved word.

'Ay,' added the Jersey captain, with a half-laugh, innocent enough, for his back was to the clergyman, whom, I do not suppose, he had even seen—but the poor fellows mean no harm in the way of business. One of them did, however.

when I asked of him what he went out for: "Captain," says he, "what do you sail your ship for?" "Money," says I. "That's it," says he; "so do I." And, by George, it's the same with all them poor missionary fellows; they only do it for the money.'

The clergyman started—his brow was knitted, his thin hollow hands tightened on one another; yet still he kept silence. His soul evidently writhed within him at these slanders cast on his cloth; but he did not speak a word. He was not born for a Martin Luther, a Benwick, a John Knox—he could 'keep the faith,' but he could not fight for it. He could sit still, with those blue eyes flashing indignant fire, those delicate lips curled with scornful disgust at the coarseness of the attacks levelled at his creed—nay, at any creed, in the presence of one of its vowed professors; but it never occurred to him to turn and say a quiet word—not in defence of the Faith, for it needed none, but in protestation against the blind, ignorant injustice which could condemn a whole brotherhood for the folly or wickedness of one. It never seemed to cross his mind to say to these poor people—of whom I heard my neighbour whispering, horrified, 'What heathens!'—that the shortcomings of a thousand priests are as powerless to desecrate real Christianity, as the poor fool who burrows away from daylight in a cave, to annihilate the light of the sun.

But passive as he was, there was something in his earnest ascetic face which gave a tacit condemnation to Mrs Red-bonnet. Gradually her onslaughts ceased, for nobody seconded them; and after the first, nobody even smiled. Something of that involuntary 'respect for the clergy,' which lies firm and safe at the bottom of the Saxon heart—especially in the provinces—imposed general silence; and the woman, who was not a bad sort of woman after all, I think, turned her course of conversation, and went on a more legitimate tack.

I did not listen to it; my mind was pondering over the pale young priest, and how strange it is that Truth, of itself so pure and strong, the very strongest thing in the whole world, should often be treated by its professors as if it were too brittle to bear handling, too tender to let the least breath of air blow upon it, too frail to stand the smallest contamination from without. Good God! I thought, if people would only believe enough in their own faith to trust it to itself—and to Thee!

We reached the terminus; and, as usual, all the fellow-passengers, like Macbeth's witches, 'made themselves air.' Mrs Red-bonnet, the captain, the clergyman, myself, and the three meek dummies in black—severally parted; in all human probability, never to meet again in this world. Peace go with them! I am their debtor for a few harmless meditations; and if they see themselves in this article, it will do them no harm—perhaps a little good.

I stopped at the terminus—one of the principal English ports—our great southern sea-gate, as it were. The salt smell blew across me, and the dim tops of far-away masts rose over the houses; indicating the quay, which is the grand rendezvous of partings and meetings between England and her colonies—England and half the known world.

Having to stay two hours, I went into the waiting-room. There—starting up as I entered—was a lady: I never shall forget her face!

Young, though not in first youth; sweet, so inexpressibly sweet, that you forgot to notice whether it was beautiful; nay, it shamed you from looking at it at all; for there were the red swollen eyelids—the hot spots, one on each cheek, while the rest of the face, though composed, was dead white. Yes, this is, as I said, the great sea-gate, the place of meetings and partings—memorable, year by year, to hundreds and thousands. She was sitting at the table—on one side

of her lay a pocket-book, and two or three letters; on the other, open, the waiting-room Bible, in which she seemed to have been reading. Hastily she shut it, and started up.

No, there was no need for that. I did the only thing possible under the circumstances—quitted the room as quickly as I came into it. Whether I ever saw the lady again—how much I felt, or pondered, or guessed of the pang which only those who have endured can understand—I do not intend to say; let it remain between her and me: I shall not 'put her in print.' If she chance to take up this paper, perhaps she will remember. I will only chronicle this one fact, which was to me a curious comment on the 'odd people' of my journey—on the 'heathen' captain and his wife, the silent, wrathful clergyman, the 'humbug' missionary and all—how I found her, with her unknown story betrayed in every line of her poor face, sitting quiet in the solitary waiting-room, with her hand on the open Bible.

THE NOBLE SCIENCE OF BLAZON.

THAT 'the noble science of blazon' should still maintain itself in spite of the utilitarians, is a strong example of the tenacity of associations once generally established. The bearing of heraldic arms, when the arms they represent were really borne by knight and squire, was the distinctive mark of gentility; none being permitted to assume them who was not entitled to them by his rank. And so enduring is a notion which has once rooted itself in the mind of a people, that even now, though centuries have elapsed since the armour of chivalry was consigned to the museums of the curious, no one who lays claim to gentility would like to be supposed deficient in his due attributes of helmet, crest, shield, and motto.

How we ourselves view this question, we shall not at present say. The wealthy cotton-spinner may still aspire, as it likes him, 'to write himself down *armigero*,' and sue out his liveries and arms at the Herald's College: our business is with the heraldic devices of the past, and not with those ingenious imitations which the multiplication of persons desirous of bearing arms has kept the invention of heralds on the stretch to supply for emblazonment on the panels of carriages and the covers of side-dishes.

It has been long a matter of dispute amongst antiquaries from what period the adoption of armorial bearings is to be dated. Some of the more zealous illustrators of the *Arts of Armory* would carry it back to the heroic ages, because Achilles and Æneas are represented to have borne some device upon their shields. By more than one writer the hieroglyphs of the heralds are deduced from those of ancient Egypt; while others, more rationally, see their origin in the symbols borne by commanders of all ages on their banners, or impressed by sovereigns and states upon their coins. Our own Sir George Mackenzie attributes their invention to the patriarch Jacob; Professor Robison, and after him Gwillim, to Alexander the Great. But the *Treatise on Armoury*, of the learned prioress of Sopewell, the Lady Juliana Berners, in the *Boke of St Albans*, as it is our most ancient, is also perhaps the most curious disquisition on the subject. It discusses the questions of 'how gentylmen began, and how the law of armys was first ordaynt,' and, in the fashion of the old chronicles, commencing with the fall of the angels, and proceeding through that of man and the deluge, it makes out our Saviour to be 'a gentylman on his morder's side;' and goes on to shew, 'by the lynage of coote armuris, how gentylmen are to be known from ungentylmen.' Mixed up with all this mass of pedantry and absurdity in the books on heraldry, there are, as usual, a few grains of truth and reason. No doubt, in the earliest ages, kings and

military chieftains bore distinguishing devices on their standards and their coins—sometimes, perhaps, on their shields and helmets. But the general use of such devices, and their hereditary transmission, are practices that unquestionably arose only in the age of feudalism and chivalry; and it is not difficult to account for their adoption. The essence of the feudal system was the obligation to military suit and service of those who held lands under the lord or suzerain. Each knight was bound for his 'fee' to bring into the field, when called on by his lord, a certain number of men-at-arms. An army, therefore, was necessarily composed of a great number of separate companies, each obeying the orders only of its knightly leader, and fighting under his banner or pennon. It became expedient, consequently, to vary to a very great extent the symbols displayed on these standards; and it is obvious how equally necessary it was that the person of the leader himself, who often fought with the visor of his helmet down, so that his features could not be recognised, should be distinguished by the blazoning of conspicuous colours on his shield, and some well-known badge on his helm. The symbols or 'bearings' thus introduced on banner, shield, crest, or surcoat, as rallying-points in the battle-field, became permanently associated with the noble deeds that were performed under their cognizance. The sons of those who had 'won bright honour' on such occasions, would therefore naturally wish to bear the badges which their fathers' prowess had distinguished; and the inheritance of arms was thus an unavoidable consequence of their general assumption.

The practice having in this manner introduced itself almost as a matter of necessity, the sovereigns in chief must have soon found it desirable to regulate it on some fixed principles. It is very doubtful, however, by whom this was first attempted. The statement of Menestrier, a French writer of considerable eminence in the fifteenth century, is most probably correct. He traces the institution to Henry the Falconer, who was raised to the imperial throne of the west in 920, and is said to have applied himself diligently to the regulation and encouragement of tournaments. But the earliest well-authenticated instances of the adoption of armorial bearings on shields belong to the twelfth century, as those of Richard Fitzhugh, Earl of Chester, and Geoffrey Magnaville, Earl of Essex. The shields on the Bayeux tapestry—the work, as our readers know, of the wife of William the Conqueror—exhibit not only crosses of different shapes and colours, but a sort of dragon. At the period of the first Crusade, it was certainly customary to ornament shields very highly. Robert of Aix, who was himself present, describes the shields of the European knights as 'resplendent with gold, gems, and colours;' and it has been plausibly suggested that the vast concourse of warriors from all countries on this occasion must have necessitated the use of a great variety of distinctive blazonings, and probably introduced what became subsequently a general practice.

Many heraldic badges and devices were no doubt originally assumed as distinctive decorations at tournaments; but the greater number took their rise from incidents on the field of battle—such as the bloody heads and hands, the battle-axes and swords, gauntlets, arrows, turrets, and so forth, with which so many shields are charged. The 'simple ordinaries,' as they are called—the bar, the bend, the cross, &c.—were probably, at their origin, but stripes of blood or paint struck on the field of victory across a plain shield by its bearer or his approving leader, as a memento of the action in which he had distinguished himself. Some bearings are celebrated by tradition as having been granted in this manner; others are known to have been assumed by the choice of their wearers. We may instance, as an early example of the first

kind, the insignia of the Hays; the first of which name, it is said, obtained his arms when, with his two sons, having rallied the Scottish army to the defeat of a horde of Danes at the battle of Luncarty in 943, they were brought to the king with their shields all covered with blood. The legend says the father was a ploughman, and fought with the yoke of his plough; whence the crest of the Hays has remained to this day a rustic bearing a plough-yoke in his hand.

The scallop-shells, bezants, Saracen's heads, crests, and crosses in all their varieties, smack strongly of the Crusades, in which they were doubtless first adopted. The animals with which so many coats are charged, were probably assumed as emblematical of the possession of their respective qualities. The 'magnanimous lion, king of beasts,' was of course a general favourite; and every device that ingenuity could suggest, was soon adopted to vary his mode of appearance, so that the same bearing should not be repeated in any two instances. He is 'tricked' of all colours, and in every attitude—rampant, passant, statant, seyant, combatant, guardant, regardant; and again, by duplication, statant-guardant, passant-guardant, &c. He is cut up into demi-lions, or reduced to a lioncel. He is 'collared,' 'crowned,' 'fettered,' or 'armed' with every known implement of violence; his head and limbs, and even his tail, are severed and displayed in every imaginable position; and, lastly, the unlucky beast is *debruisé*, *dehaché*, or, 'couped in all parts' to adorn the coat of the Maitlands.

Next to the lion, in general esteem, ranks, perhaps, the leopard, two of which are supposed to have been borne on the shield of William the Conqueror. The stag, the boar, the eagle, the falcon, the greyhound, the bull, and the horse, run very close in the rivalry of favour. The choice of beasts of chase is probably derived from the predilection of their first bearers for the sport; indeed, there always seems to have existed a close connection between heraldry and the chase. The *Boke of St Albans*, already mentioned, treats of 'hawkyng, huntynge, and armoureye;' and Henry the Falconer has been noticed as the probable founder of the science of blazon itself. The technical description by heralds of some of these bearings, sounds not a little whimsical to the uninitiated; as when mention is made of 'two greyhounds respecting each other,' a 'peacock affronté,' a 'buck's head attired proper,' &c.

Some charges are evidently chosen as a sort of hieroglyph of the family name; such are the rose borne by Roche, primroses by Primrose, the crow by Corbet, three whales by Whalley, pikes by Long, arrows by Archer, bows by Bowes, the elephant by Oliphant, three right arms mailed and gauntleted by Armstrong, bulls' heads by Gore, with many other instances. Not only have the earth, seas, and air been ransacked for heraldic figures, but the heavens themselves and the regions of fable. Chalonier bears the cherubim; suns, crescents, and stars shine on many shields; griffins, cockatrices, wiverns, dragons, harpies, mermaids, phoenixes, and unicorns, display their portentous attributes, and were probably assumed, like the Gorgon's head of old, for the purpose of petrifying the antagonist. Stephen of Blois bore a centaur on his coat. The arms of the Duchy of Milan are a crowned serpent swallowing an infant, which is said to have been adopted by Otho, first Count of Milan, when on his way to the Holy Land with Godfrey of Bouillon, he slew the 'great giant Volux,' who wore the same crest upon his helmet. Bishops, on the other hand, appropriately inscribe keys, crosiers, mitres, and lambs, and angels on their coats. The bearing of the Bishop of Chichester is odd enough—namely, Presbyter John sitting on a tombstone; in his left hand a mound, his right extended; a *hennin* (a woman's head, in his mouth a sword.' The common motto of

of fortresses naturally suggested the towers, battlements, keys, portcullises, and battering-rams seen on many escutcheons. One of the most singular bearings in existence is that of the ancient Scottish family of Dalziel—namely, a naked man hanging from a gallows with his arms extended—a bearing of honour, though so liable to be taken for the reverse, since, if 'hoar antiquity may be believed,' it was granted to perpetuate the memory of a brave and hazardous exploit performed by an ancestor of the Earl of Carnwath, in taking down from a gallows the body of a favourite kinsman of Kenneth II., who had been hung up by the Picts. A reward having been offered by the monarch to any one who would rescue the corpse, none were inclined to venture, till a gentleman of the family of Menteath came to the king and said 'Dal-zel' (Gaelic for 'I dare'), and having performed the task, assumed the above arms and the surname of Dalziel. Such at least is the legend.

The 'differences' borne to distinguish the younger branches of a family are said to have a hidden moral in them. The crescent of the second son indicates that there is room for the increase of his fortune; the mullet, or spur, of the third, hints that he must up and ride if he means to get anything; the martlet, or swallow without feet, of the fourth, reminds him that he must keep upon the wing, having no land to stand upon. These allusions are probably imaginary.

The origin of 'supporters' is much disputed by heralds, some maintaining them to be derived from the custom of an individual about to be invested with some dignity being led to his sovereign between two nobles, in remembrance of which he chooses two noble animals or figures to support his arms. Menestrier, the French heraldic writer already referred to, traces the practice to that of ancient tournaments, 'in which the knights caused their shields to be carried by pages in the disguise of lions, bears, griffins, blackamoors, and the like, who also held and guarded the escutcheons exposed to public view some time before the lists were opened.' The probability, however, rather is, that supporters were introduced as a sort of ornamental garnish to the shield, and originated in the taste or caprice of the seal-engravers. Their use is at present confined, in England, to the nobility and Knights of the Garter, with the addition of a few entitled families who have received a royal grant for some special service. In Scotland, the chiefs of clans and baronets of the Nova Scotia creation are also entitled to them.

Formerly, abbeys and religious houses bore arms; trades, guilds, and corporations bore them, and fought gallantly under them too; towns and cities likewise had their escutcheons, as well as the universities, and their several colleges, schools, and public hospitals. They are, in most cases, still jealously preserved, and employed on the seals of these bodies, on their badges of office, and for other purposes. Every bishopric, as already mentioned, has its shield and armorial bearings, in this country as well as throughout the continent.

Blazoning was not confined to the shield, but, at the time when arms were really worn, was likewise displayed on the surcoat, the mantle, and the *just-aux-yeux* or bodice. On these, the charge was usually embossed in beaten gold, or embroidered in resplendent tissue. Richard II. carried this magnificence of decoration to its highest pitch; but long before his reign, the knights and nobles of France and England were accustomed to plunge into the dust and blood of battle arrayed in the most costly and splendid attire. Sir John Chandos lost his life at the affair of Pont de Cassene owing to the rich and long robe he had on over his cuirass, which Froissart describes as 'blazoned with his arms on white saracenet, argent a pile gules, the charge on his breast, the other on his back.' A curious document, entitled *The Apparel of the Field of*

a Baron in his Sovereign's Company, contributed by Sir Frederick Madden to the twentieth volume of the *Archæologia*, gives an inventory of the equipments for a foreign campaign of Henry, the fifth earl of Northumberland, the same whose *Household Book* is so well known. It describes, in the earl's wardrobe, his 'harness and cote-armure beaten with his arms quarterly,' with a large number of coats, standards, banners, and hundreds of pennons, all 'beaten' or 'powdered with my lord's arms.'

'Badges of cognizance' were sometimes called 'signs of company,' a phrase explanatory of their use. Retainers of every description bore the badge of their lord, and the minstrel of a noble house wore it suspended to his neck by a silver chain. The 'bear and ragged staff' of the earls of Warwick, the 'buckle' of the Pelhams, and the 'annulet' of the Cliffords, are well-known badges of ancient baronial families. The badges of the House of Lancaster were the antelope and the red rose, and a swan 'gorged and chained.'

Henry of Hereford, Lancaster, and Derby

were the first and last of these embroidered on green and blue velvet when he entered the lists near Coventry against 'the Duke of Norfolk, Thomas Mowbray.' And in that age of factious broils and civil warfare, badges were thought of sufficient importance as party symbols to be forbidden by statute—particularly Richard's white hart, which was so frequent an annoyance to Henry IV. In our own days, we have seen the violet and the fleur-de-lis proscribed in turn for a similar cause. The Scottish clans commonly employed as badges a sprig or branch from some tree or bush: Chisholm, the alder; Menzies, the ash; Buchanan, the birch; Maclean, the blackberry; Buccleuch, the heather; and so on.

The charge and cognizance were, moreover, profusely embroidered on the trappings of the war-horse and the draperies of the tent; but above all, they were blazoned conspicuously on the standard and banner of the sovereign, noble, and banneret, and the pennon of the knight. These were borne before them in all warlike expeditions, often planted on the field by their side, hung out at their temporary lodgings, suspended from the roofs of their halls, and finally reared to droop in sympathetic decay over their graves.

The architect made a liberal use of arms, as well as of crest and badge, in the adornment of both the exterior and interior of his buildings, ecclesiastical, civil, or domestic. They were sculptured on the walls and over doorways and windows, enriched the gables, drips, corbels, and pinnacles, were painted and embossed on ceilings, and introduced, above all, in stained windows. On every piece of furniture they were carved in profusion, embossed on plate, embroidered in the richest manner in gold and silver upon silk or velvet, on canopies, arras, the coverlets and draperies of beds, cloths, and vestures of numerous kinds. The heralds wore them on their tabards, which were and are literally 'coats of arms.' But one of their most ancient and solemn uses was on seals, the seal of a knight or noble affixed to a deed being a convenient substitute for his signature, when, as was usually the case, he could not write—a desirable confirmation of it when, by miracle, he could.

On sepulchral monuments, arms were splendidly and profusely sculptured and blazoned; none, however, appear on the most ancient monumental effigies preserved in our churches and cathedrals. One of the earliest on which they occur is that of Geoffrey Mandeville, Earl of Essex, in the Temple Church. He died in 1148, in the very infancy of heraldry. The general use subsequently made of heraldic escutcheons as an ornament to tombs and a memorial of the family alliances of the deceased, is observable in all our cathedrals and churches; in which also the hatchment,

or funeral achievement, of the departed was usually preserved as long as its more perishable materials permitted, together with, in many cases, the real arms in which he had fought. Over the tomb of Edward the Black Prince, in Canterbury Cathedral, there still hang his shield and surcoat, embossed and embroidered with the arms of England and France, with his gauntlets and the scabbard of his sword. The sword itself is said to have been taken away by Oliver Cromwell. Of the genuineness of these remains, we believe no doubt is entertained.

But without exhausting our subject, we are afraid we have fully exhausted the reader's patience; we therefore bring our lucubrations to a close, although we are thereby necessitated to leave many strange charges entirely unnoticed.

KRASINSKI: A TALE.

IN FOUR CHAPTERS.—CHAP. IV.

It was a bright day in spring when they sailed into the beautiful bay of Naples.

'What a place to come to on such an errand!' exclaimed Edmonds.

'A very good place to come to—never mind the errand,' said De Rosny, smiling.

They employed themselves as people usually do on their first arrival at that fascinating capital; and they had a very good excuse in doing so, since they had no directions how else to proceed—a circumstance which eased their consciences when they thought of the ghost, which was not very often amid so many amusements. Moreover, not long after they arrived, they received a letter from the host of the Leone Bianco, to whom, at the instigation of Emma, they had written to make inquiries on the subject, saying that, on reference to his books, he found that it was not on the 9th, but on the 10th of April that Arthur and Krasinski had quitted Venice. Naturally, this discrepancy discredited the ghost considerably, if ghost there was, though Everard was by no means free from anxiety about his brother.

However, his uneasiness was shortly still further lightened, by a letter from Emma, conveying the pleasant intelligence that they had at last heard from Arthur.

'But you will wonder at his carelessness, well as you know him,' she said, 'when I tell you that the letter was written at Venice in April, though we have only just received it! He writes to acknowledge the receipt of the money he had sent for; and says that he is about to quit Venice, and try to rejoin M. de Rosny at Rome—M. de Rosny having been called away several weeks ago—and that he is tired of waiting for him, especially as his friend Count Krasinski is leaving for England, and that he shall go on with M. de Rosny to the east. He says he has given Krasinski an introduction to mamma, and advises me to take care of my heart, as he is a "handsome nice fellow, and sings like a nightingale;" and so he certainly does. He concludes with begging us not to be uneasy if we get no letters, as he shall be constantly on the move, and have no time to write. Of course, a letter written so long ago would have gone for nothing, and mamma was in a dreadful way when she read it; but, on turning the leaf, we found a postscript dated Aleppo, begging a thousand pardons for his having forgotten to post the letter, which, to his horror, he had just found in his desk. He adds: "I am all right; but I've sprained my wrist by a fall from a camel, and am obliged to scrawl this with my left hand; so no more from your affectionate brother."

'How lucky that I never told mamma of my dream!

What needless misery it would have cost her! This letter is almost the duplicate of the one we received from Venice, and I think he must have mislaid this and written a second, which he has since forgotten. It appears to have been wet; it is not very legible; and we have just made out that the post-mark is *Milan*, which is odd, when the postscript is dated *Aleppo*. Can he be on his way back?

'But, O Everard, how ill I have behaved to Krasinski! Will he ever return to me, or think of me again? Perhaps, when he can bring Arthur with him, he may, if he really loved me as he said he did; but he has never written, nor did I expect he would, for he is very, very proud.'

'So much for the ghost!' exclaimed Everard; and he wrote to his sister, saying that he hoped this affair would be a warning to her not to indulge in absurd superstitions; above all, not to act upon them. 'Things will come to a pretty pass if young ladies take counsel of their dreams in the conduct of life. I am afraid, Emma, you will never see any more of Krasinski; and I suspect you have lost a good husband by your folly.'

All anxiety regarding Arthur being thus removed, De Rosny, feeling that his mission was at an end, announced his intention of leaving Naples. He invited Everard to accompany him northward; but the latter declined, alleging that he liked the place, and, his leave being nearly expired, it was not worth his while to move.

'Confess,' said De Rosny, 'you don't like to leave the beautiful Russian? When I am gone, who knows but she may pay you another visit.'

'I have no such hope,' answered Everard; 'she will scarcely return my bow when I meet her on the stairs, though I take off my hat with an admirable grace, and endeavour to look as killing as I can.'

'Well, you will have the consolation of listening to her delicious voice, at all events,' said De Rosny.

'That's a dangerous pleasure, so I mean to relinquish it,' answered Everard. 'These apartments are too expensive for me when I am alone, and I shall remove to the *Hôtel d'Italia*.'

The beautiful Russian alluded to was the Countess Stephanie Menchikoff, and Everard's acquaintance with her had originated in a singular incident.

On their first arrival at Naples, or, at least, after they had been there a few days, but before the intelligence from Venice and London had destroyed all faith in the apparition, De Rosny, who, sceptical as he was, did not like the idea of another interview with his midnight visitor, observed, that it was very perplexing, if anything was required of him, that he was not told what it was.

'Here we are at Naples, but what are we to do? Unbeliever as I am, I complied so far as to go to Malta—where, however, I probably should have gone in any case, though not quite so soon—and I have accompanied you here; but what next? How are we to proceed? It would be much more to the purpose if the ghost had directed us what to do.'

'But that's always the way in ghost-stories,' replied Everard. 'There is always something that renders their proceedings incomprehensible and abortive. He ought to pay you another visit, and explain his intentions.'

'Well, to confess the truth, I had rather be excused—unless, indeed, we were together. I should have no objection to that sort of thing if I had company; indeed, I should rather like it. A man, when he is alone, under such circumstances, is not master of his mind; his recollection afterwards is confused, and he does not know whether he is asleep or awake. Suppose we invoke the spirit some night when we are together!'

'With all my heart!' said Everard. 'Why not this

very night? With a bottle of *Lacrimachristi*, and some good cigars, we may get through the night; and if nothing comes of it, we shall, at anyrate, have the satisfaction of feeling that we have done all we could in the business.'

Accordingly, having spent their evening very agreeably in hearing an opera of Rossini's, they established themselves in their salon, when the other inhabitants of the hotel went to bed; and with their wine and their cigars, prepared to pass the night.

They chatted for some time about the music and the singers they had heard, till all seemed perfectly quiet in the hotel; and then Everard proposed that they should collect themselves, and solemnly invoke the spirit—it must be admitted, however, without the smallest expectation that their invocation would have any effect.

'You had better pronounce the invocation,' said De Rosny; 'but I believe we should put out the light first: here are the matches to light it again.'

The candles being extinguished, Everard, in a low, earnest voice, called upon his brother, if he were dead, to appear to them, and instruct them how they should proceed to effect whatever purpose he designed in sending them to Naples.

A short silence ensued, and then, to their amazement, they heard the handle of the door turn. De Rosny, who, from his own experience, was naturally less incredulous than Everard, pressed his companion's arm:—the door opened, and they saw by the gleam of light that entered from the staircase, where a lamp burnt all night, a ghostly figure glide in, and, with noiseless step, cross the room towards the window, where it paused, waiting, as Everard—who now really believed it to be his brother—supposed, to be spoken to. Overcome with awe, he rose from his chair, prepared to address the apparition; but at the first motion he made, before he had time to utter a sound, the figure fled with such precipitation, that Everard, who pursued it, only reached the door in time to see the tail of a white petticoat disappearing on the stairs above. However, he heard a door close on the second floor, and De Rosny, who was following, exclaimed: 'Quel dommage! Voilà un revenant avec qui je ferais volontiers connaissance!'

'Whether she is pretty, I can't say,' rejoined Everard, 'for I only saw her petticoat-tail, but she is young to a certainty. I never beheld such activity. She was up the stairs like a bird! Her feet scarcely touched the ground! What could have brought her here at that identical moment? One would think she knew of our design, and was playing us a trick.'

'Impossible,' returned De Rosny; 'nobody knew of it. Probablement, elle s'est trompée de chambre.'

This was the most feasible explanation: they enjoyed a hearty laugh at their own expense; and, the solemnity of their vigil being utterly dispelled, they went to bed. The next day, they asked the waiter, without telling the motive of the inquiry, who lodged over their heads, and they were informed it was the Countess Stephanie Menchikoff, and that she had previously occupied the lower floor, but had moved, the day the young men arrived, to one less expensive. The waiter added, that she was *très belle*, and a very fine singer; 'elle a une voix charmante,' he said. Whether she was married, he could not say; nobody visited her but her brother.

After this, the young men made several efforts to become acquainted with the fair stranger; but she resolutely discouraged all their advances, in spite of a good deal of perseverance on the part of Everard, who was considerably *époué*; which was not to be wondered at, for she was really a beautiful woman, and her voice, as the waiter said, was *charmante*. He often spent half the evening, when De Rosny was otherwise engaged, at her door, listening to her enchanting strains. Some-

times her brother was with her, and they sang together, with exquisite taste and skill.

One evening, as he was ascending the stairs, he met this brother—a tall, fine-looking, dark man, bearded and mustached, who started back with apparent surprise, and evinced so much annoyance, that Everard relinquished the indulgence of listening to the music, lest he should get into a quarrel that would end in making him ridiculous, since the lady certainly gave him no encouragement.

His ill success diminished his regret at removing to his new apartments, which he did the day of De Rosny's departure. As he had formed acquaintance with two or three young compatriots, he got on pleasantly enough, till his leave had nearly expired, when he wrote to De Rosny, who was at Rome, to announce his approaching departure, and to mention also, that when he was packing up at their old hotel, he had found a valuable ring of De Rosny's in one of the drawers of the *chiffonier* in the salon.

'I should have sent it before,' he added, 'but I could not find a safe vehicle. Yesterday, however, I chanced to meet that little fig-merchant that was on board the packet with us, and as he said he was starting for Rome, I have ventured to intrust it to him—I mean the fellow that had that comical souse in the water. Heaven knows whether he is honest; but I have not told him the value of the parcel. Pray, write immediately, and say if you have received it, as I shall not feel happy till I know it is safe.'

Two days after this letter was forwarded, Everard discovered that he had been robbed of the money that had been remitted to him from England to pay his bills and his passage-money to Malta, and also of a set of diamond studs and some other articles of value. How or when this robbery had been committed, was as difficult to discover as the thief. It might have been done in the night, or while Everard was out the preceding evening. People of all countries and languages were incessantly coming and going; several had quitted the hotel that morning, and no suspicion attached to any one in particular. Of course, this delayed his departure; he wrote to his commanding-officer to account for his absence, and to De Rosny to acquaint him with his misfortune; but instead of an answer by letter—indeed, before he could have received one—De Rosny arrived himself.

Everard, supposing he had come to relieve him of his difficulties, eagerly welcomed him.

'How kind this is of you!' he exclaimed; 'you may imagine what an awkward fix I'm in!'

'Why?' said De Rosny, looking astonished. 'What has happened?'

'Haven't you received my letter?' said the other.

'Yes, and the ring also.'

'But my subsequent letter?'

'No; I started almost immediately—at least, the day after the Greek brought me the ring. But what's the matter?'

Everard thereupon related what had occurred.

'Very vexatious!' said the other; 'but console yourself with the reflection that your loss is nothing to mine at Venice.'

'It's as much to me,' replied the lieutenant, 'because you're a rich fellow, and the loss of your jewellery and other little matters is nothing to you. But if you have not had my letter, what has brought you back to Naples?'

'You shall hear,' replied De Rosny. 'That ring you sent me by the Greek is part of the plunder of the rogue who robbed me at the *Leone Bianco*.'

'Is it possible?' said Everard.

'Quite true, I assure you,' answered De Rosny.

'Good heavens!' exclaimed Everard, turning pale.

'Then probably the rascal who committed the robbery is actually here—and my brother'—

'That is the point,' returned De Rosny.

Everard sank into a chair, and covered his face with his hands—'My poor brother!' he exclaimed. 'Poor Arthur!'

'We are certain of nothing yet: the man that stole it may have parted with it—it may have passed through many hands since; but, to say the least of it, it is a curious coincidence, that here, where we have come in compliance with the directions of the ghost or dream, whichever it was, we should stumble upon the first trace of the thief.'

'And murderers!' murmured Everard, without raising his head.

'The first thing to be done,' suggested De Rosny, 'is to find out who inhabited those rooms.'

'The Russian countess left them the day we went in; but she can have nothing to do with it; besides, it may have lain for some time where I found it. It was quite at the back of the drawer of the chiffonier—the drawer I used to keep locked, where I put my money; and I should not have seen it, but that, in my haste, as I was coming away, I pulled the drawer quite out.'

'Well, we must get what information we can,' replied De Rosny; but the difficulty was, how to get any that was available. The master of the hotel said that the Countess Stephanie had lodged there some weeks; before her, the rooms were inhabited by an English family; who were preceded by some Turks of distinction; and so forth; and as they were very expensive apartments, all the occupants had been of the higher class. All he could say was, that nobody had ever complained of the loss of such a ring; and that it was quite uncertain how long it might have been in the drawer. They spoke to the inspector of police, who shrugged his shoulders, without making any remark.

This affair occupied them a good deal for some time. They were unwilling to believe that the clue, so unexpectedly found, was to lead to nothing; besides, Everard had begun to be seriously alarmed about his brother, and the letters of his mother and sister expressed considerable uneasiness.

'How should that letter of Arthur's,' said Emma, 'have been posted at Milan? If he was then on his way back, which he surely must be by this time, if he has not long ago returned, why does he not write again? His conduct is inexplicable, if he is alive and well. How came that letter wet, too? Does it not seem as if that had some connection with the drowning? But then the landlord of the hotel says he left on the 10th of April. Altogether, it is very perplexing, and keeps mamma in dreadful suspense. What would her case be, if she knew all?'

Notwithstanding these reasons for anxiety, they were obliged to resign themselves to inaction, since they knew not how to take advantage of the hint afforded by the ring; and as Everard had procured an extension of leave, he resolved to accompany De Rosny to Rome. After spending a fortnight there in sight-seeing, he took his place in the public conveyance to return to Naples, and found himself seated beside the Greek fig-merchant, whom he saluted, and thanked for having safely delivered the parcel he had intrusted to him.

'It was very lucky I met you that day,' said he, 'for the parcel contained a very valuable diamond ring belonging to Monsieur de Rosny, which otherwise never would have reached its owner; for I was robbed that night of all my little valuables, and my money too. A rascal got into my room at the hotel, and plundered me of everything of value, except my clothes.'

'Ah, no—that would not suit; they are not portable enough. So you were one of the victims. You know he is taken?'

'Who? The thief?'

'You have not heard of it?'

'Not a word! Where? At Naples?'

'At Naples. A trap was laid for him, and he was caught robbing somebody at the Hôtel d'Italia; and since he is found to be an escaped *forçat* with the mark of the *bagne* on his shoulder, he is condemned to death, and I am going to see the execution; for, to say the truth, he is an old friend of mine.'

'I compliment you on your acquaintance.'

'Well, he was the most plausible fellow in the world. I think he would have deceived the devil himself. When I first knew him, he was a teacher of music, and lodged with my sister at Milan. He was the cleverest fellow, too, I ever met! He spoke French and Italian like a native, and, indeed, generally passed for an Italian, though he was in reality a Russian. I should think he would have made his fortune in your country if he could have been honest. He was connected with the Carbonari, too, and was at one time employed as a spy, which, I suspect, is the real reason why they take his life.'

'Did you ever hear if he had a sister?' asked Everard, struck with a sudden thought.

'No,' replied the other, 'I never heard of his having a sister; but he fell desperately in love with a danseuse: a beautiful woman she was; and she had a sweet voice, too, though not of sufficient power for the theatre. I believe it was a real attachment, for he took her from the stage, had her voice cultivated, and married her; and for some time they made an excellent thing of it. They went to Paris, and had great success as chamber-singers; but wherever he went, somehow, something unpleasant happened, and I lost sight of him for a long time. I had a strong suspicion, lately, that he was on some new course of action. He was very shy of his former acquaintance, and seemed very flush of money. He used to pretend not to see me when we met; but a few months since I was taking a cup of coffee in the Corso, when he happened to pass, and saluted me quite in a friendly manner. I thought he wanted something of me; and when he sat down beside me, and called for some *caraças* and *cigars*, I felt sure of it, and buttoned my breeches pocket. However, it was not money he wanted, but only that I should put a letter for him into the post at Smyrna or Aleppo.'

'But how did he know you were going there?'

'Oh, he knew that my business carried me there frequently. I forgot the letter, however, and never thought of it till I got back to Milan.'

'To Milan? And did you post it at Milan?'

'Yes, I did.'

'Have you any recollection of the address of that letter?' inquired Everard.

'None, except that it was addressed to somebody in England,' answered the Greek.

'May I ask you if that letter ever got wet while it was in your possession?'

'To be sure it did; don't you remember my falling overboard? I had it in my pocket-book then. Why do you ask?'

Overcome by surprise and emotion, Everard could scarcely answer; but as soon as he could speak, he gave his communicative companion a sketch of past events; adding, that the finding of the ring, and this remarkable disclosure about the letter, led him to suppose that the thief under condemnation was also the murderer of his brother, and that the revelations of the ghost were but too correct.

The Greek, to whom such beliefs were not strange, had no difficulty in accepting the evidence, and confirmed at once Everard's suspicion in regard to the Countess Stephanie.

'It seems that he has been carrying on this system of plunder some time,' said he: 'his wife always had apartments in a first-rate hotel; he never took

anything bulky, and he deposited his spoil with her. It was a capital scheme! In his own apartments, nothing could be found; and who would have thought of searching a great lady's rooms at a hotel? He had several disguises; and they say his make-up, and his familiarity with different languages, rendered it almost impossible to detect him; besides, the fellow is half a comedian.'

Furnished with this information, Everard's first care was to send back a messenger to De Rosny, which he did from Velletri, urging his following him to Naples immediately; and he accordingly arrived almost as soon as himself.

'But what is this fellow's name?' inquired De Rosny.

'Caldesi is the name he went by at Milan; but the Greek says he has several *aliases*, and that to his knowledge he sometimes passes for an Italian or a Frenchman. I have already applied for an order to see him, and was most anxious for your arrival; to-morrow he is to be executed.'

But although the English ambassador was appealed to, the order was not to be obtained. 'The criminal has confessed and made his peace with Heaven,' said the priest; 'his last moments must not be disturbed; and all their exertions could not procure a reversal of his decree.'

They were inexpressibly disappointed; but anxious at least to see the man whom Everard now feared might be the murderer of his brother, they were early at the place of execution. The scaffold was erected at the Piazza Cavalcotojo; and the ambassador, though he could not obtain permission for them to visit the prison, provided them with an order that secured them in advantageous situation from which to view the last moments of the culprit. But early as they were, soldiers, who have their part in all such ceremonies on the continent, lined the square, and crowds of lazzaroni and other curious spectators, eager to see how a blow-creature died, were already assembled.

With difficulty the two friends reached their places; and they were not long seated, before a murmur and movement among the crowd announced that the procession was at hand. A group of people approached; uniforms glittered in the sun, contrasting with the black and gray robes of ecclesiastics; and, surrounded by the Bianchi, carrying crosses covered with black, they could just discern an uncovered head. De Rosny was silent; Everard could scarcely preserve the semblance of composure; he felt as if the next few moments would reveal a terrible secret.

The procession stopped behind the scaffold; and some minutes elapsed before the chief figure in this awful scene ascended the steps, and appeared accompanied by one of the *padri assistenti*, to whose assiduous ministrations, to judge by his attitude, he was attentively listening. After a few words spoken, the confessor appeared to give him his blessing, and then the unhappy man raised his head to take his last look at he would he was leaving.

'Ciel!' cried De Rosny, starting from his seat; and he did so, the eye of the criminal met his. A glance of recognition and indomitable resolution acknowledged the acquaintance.

'Krasinski!' murmured De Rosny, in a voice stifled by agitation.

Everard seized his arm, and, livid with emotion, rose so; then the eye turned on him, and quailed—Arthur and Everard Edmonds might have been taken for twins, they resembled each other so remarkably.

'I read my brother's murder in his face!' he gasped out.

De Rosny significantly bowed his head.

A moment more, and the signal was given; the tragedy of death was over; and the possessor of all those rare endowments was gone to account for the

use he had made of them, carrying with him the secret that was never to be disclosed.

A piercing scream, and a movement among the crowd near a woman who had fainted, testified to there being one heart amidst the thousand that beat for Michel Lowstoft.

All efforts to discover Stephanie failed. Arthur Edmonds was no more heard of; and the only thing ever ascertained was, that he and Krasinski had quitted Venice on the 9th of April. On being personally interrogated, the landlord of the Leone Bianco called to mind that the bill had been ordered and made up for the 10th; but that on the morning of the 9th, for some reason unknown to him, they had altered their minds, and suddenly departed.

SUICIDE IN FRANCE.

ONE of the many popular errors prevalent in France concerning England is, that there are more suicides here than there; and the reason given is the one which Montesquieu enunciated years ago, and which men, parrot-like, repeat after him without examination, that our execrable climate is so miserable we are glad to escape its perpetual fogs even by self-murder. As every *milord*, according to Gallic ethnography, has an insane love of boxing and betting, so has he the 'spleen' and a suicidal monomania. You may argue with a Frenchman on this point to the end of time without effect; you may prove by the eternal truths of Cocker that he is wrong, and that the balance is most heavily weighted on his own side; he will only laugh at your credulity, and ridicule your national pertinacity. The thing is undeniable, according to him. 'Have we not got fogs, and rain, and miasma, and swamps enough to infuse that profound disgust of life which is our national characteristic: ergo, must we not necessarily have the largest number of suicides?' So the argument ends with a smile and a shrug; perhaps with an epigram in addition; and the Frenchman leaves you saying to himself: 'Que ces Anglais sont bêtes!'

But a recently published work, 'crowned by the Imperial Academy of Medicine,' and written by M. Lisle, ought to set the question of proportion at rest, for this generation at all events. No man who carefully masters the facts and reasonings of this work, can doubt for a moment where lies the suicidal preponderance in Europe; and where—adopting the Frenchman's argument against himself—it must lie by the very nature of things: granting M. Lisle's causes and figures to be correct.

The book opens with the avowed intention of combating the doctrine that suicide is *always* a sign of mental alienation. Sometimes, and often, of course, it is; even giving a distinctive name to a certain species of monomania; but it is not always and necessarily so. Suicide, like every human fact, obeys fixed laws as exactly as the course of the planets or the crystallisation of salts; and year by year it can be confidently predicted how many out of a certain population will commit suicide; in what proportion between the sexes, and in what proportion between the inhabitants of the towns and the country; the means which will be used, and, to an extent, what will be the moral or social causes of suicide being resorted to.

The result of the writer's investigations, so far as England is concerned, is very far from corroboratory of the opinion of Montesquieu and the national Gallic belief touching our mortal ennui and our suicidal monomania. In France, from 1836 to 1852 inclusive, there were 52,126 suicides, or a mean of 3066 a year; the numbers rising steadily from 2340 in 1836, to 3674 in 1852. From 1827 to 1830, the mean number had been only 1800 a year. Before 1836, the proportion was one suicide for every 17,693 inhabitants; in 1836, it was

one for 14,207; and in 1852, it had risen to one for 9840. In 1838 and 1839, England had one suicide for every 15,900 inhabitants; France, one for every 12,489. Between London and Paris, for the same years, the difference is yet more remarkable, the figures being, for London, one in 8250; and for Paris, one in 2221. This is surely a sufficiently distinct contradiction to the generally received opinion!

The north of France is the most prolific in suicides; nearly half of the whole number belongs to the north, which has increased its own ratio by one-third. The north has one in 6488; the east, one in 13,855; the south, one in 20,457. The department of the Seine, which includes Paris, has risen with frightful rapidity; but Paris and Marseille, and all large centres, are the foci of suicides to a very striking extent. Russia stands the lowest of European states in the scale—her suicides being only one in 49,182; while Prussia has one in 14,404; Austria, one in 20,900; New York, one in 7797; Boston, one in 12,500; Baltimore, one in 13,650; and Philadelphia, one in 11,873.

Climate has not much to do with the matter. In latitude from 42° to 54°, the proportion is one in 38,882; from 54° to 64°, one in 56,577. Yet the last figures include Moscow and St Petersburg, and represent a much more rigorous, damp, uncertain, and joyless climate than the first. Certainly, the low condition of civilisation between these latitudes influences the statistics to the full as much as any other assigned or assignable cause; but that mere temperature and climate have little to do with the question, is proved by the average number of suicides occurring in the different months of the year in France; which are highest in the sunniest, brightest, and most enjoyable seasons. We cannot refrain from giving the table entire; it opens a view so very different from the one popularly received. The list is the average of seventeen years' computation.

For January, the mean number of these seventeen years gives 3761; for February, 3529; for March, 4428; for April, 4872; May, 5486; June, 5722; July, 5517; August, 4652; September, 3959; October, 3845; November, 3282; December, 3227. With this list in his hand, what will the Frenchman say now to the irrefutable influence of our fogs and miasmas?

In age, the rate increases gradually from under sixteen up to forty, when it slowly decreases to eighty and upwards. The mass occurs in middle age; but there has been recently a noticeable increase of suicides by children—which are now sevenfold what they were thirty years ago for children under sixteen years of age, twelve times as many for youths from sixteen to twenty.

'One youth,' says Esquirol, 'leaves a writing before killing himself, in which he bitterly blames his parents for the education they have given him; another blasphemes God and society; a third kills himself "because he has not enough air to breathe with ease;" two young men of letters, at the age of twenty-one each, suffocate themselves with charcoal, because a theatrical piece which they had composed together has not succeeded; a child of thirteen hangs himself, and leaves a document beginning: "I bequeath my soul to Rousseau, and my body to the earth;" one of twelve hangs himself for rage at being only the twelfth in a school exercise, where he expected a better place; and another, of thirteen, hangs himself in a cell where he was unjustly confined.' What a painful mass of ill-regulated passion, and misdirected life, lies in those few sad lines!

In sex, the general proportion is 1 woman to 3.35 men in towns, and 1 to 4.35 in the country; and the most fatal times of life to the female sex are from fourteen to twenty, and from forty to fifty. Women-servants are more in relative proportion than men-servants; the absolute numbers being almost the same; but

taking into account the proportion of the two sexes in domestic service, that particular ratio is singularly elevated. There are very few suicides among the unfortunates, though these largely people both the prisons and the madhouses. At the Salpêtrière Asylum, out of 264 women confined there in one year, 83 were of this class; while in a period of seventeen years, only 53 had committed suicide. There are also very few among life-convicts—only 6* in twenty-one years out of the large population of the *bagnes*; but several among short-time prisoners and the simply 'accused.' On the whole, sad as it is to confess, and anomalous as it seems at first sight, suicide increases with education and civilisation. The savage rarely, if ever, takes his own life; the sensitive, highly organised, and highly educated man of literature and science ends his days by the pistol or the cord.

The means employed for suicide are generally hanging in youth, firearms and poison in maturity, hanging in old age. Women rarely use firearms: they prefer hanging, drowning, poison, and—in France—asphyxiation by charcoal. But it is strange to read the statistical tables, and to see how every year the same proportion is maintained between the methods—how many, out of a given number, are sure to use hanging, how many drowning, how many poison, firearms, and so on—all calculated with as much certainty as the height of the tides or algebraic quantities.

The causes assigned by M. Lisle are singular: mental alienation stands first in number; physical suffering next; then domestic troubles, debt, poverty, habitual intoxication—a cause which, we fear, holds a higher rank than the sixth in England—misconduct, disgust at life, love-disappointment. These come in their order, and have by far the largest influence of any ascribed. But other causes are given. Thus, eight suicides are ascribed to 'rivalry in trade,' seventy-seven, to 'disgust at a certain social position,' twenty-six (all men), to 'sorrow at exile,' the same number, of whom nineteen are men, to 'jealousy between brothers and sisters,' eighty, to idleness, four only of these being women; seventy-seven, to sorrow at leaving a certain place or master; with others as subtle and as strange. But the two most prominent causes are mental alienation and disease.

In the chapter on mental hallucinations are quoted the following striking instances of involuntary suicide: A man, thinking to open the door of his apartment, opens the window, and flings himself into the street, believing that he is descending the staircase. Another thinks himself on the ground-floor, and jumps out of his window on the fifth story. A third, attempting a rudeness to a woman who escapes him, flings himself into the hall from the third story, leaping over the banisters of the well staircase, in order to intercept the woman rushing down the stairs. A fourth hears a heavenly voice whisper to him: 'My son, come with thyself by my side,' and straightway throws himself out of his window, breaking his leg; when raised, he expresses the greatest astonishment at his fall, and above all, at his fracture. A youth, haunted by a mysterious dread of punishment for certain imaginary crimes, resolves to starve himself to death. Taken to the hospital, and there treated as a sick man—which, in fact, he soon becomes—fed by mechanical means, and carefully watched, he recovers sufficiently to be allowed to travel. But he scarcely arrives at home when his sufferings return, and, in spite of all that is done for his relief, he dies of starvation, self-imposed, at the end of a few days. A boot-maker of Venice, Mattéo Lovat, after having horribly mutilated, and even killed himself, 'in obedience to the will of God, which had been revealed to him.' Taken to the madhouse.

* Writers on criminal statistics in France give a higher number.

San Servolo, he starved himself to death. Not that religious mania or suicides are so frequent in France as with us; our comparative list of causes would show very different results in other particulars, but more especially in this.

On the 11th of December 1847, a poorly dressed man was taken out of the river, near the bridge of St Cloud. In his pocket was the following letter: 'Hunger and want of a home force me to commit suicide. For the last four years and a half I have lodged at the Rue Guérin-Boisseau, 32, with my wife and my little daughter, who is nearly nine years old. Being behind-hand in my rent, they have refused me my key.—Philippe Toussaint.' This poor fellow was a public scribe, noted in his neighbourhood for his honesty, industry, punctuality, and resignation to his hard lot.

A few years ago, a poor boy in the hospital of Bicêtre, confined among the lunatics, had been arrested at the moment when about to throw himself into the Seine. Though perfectly sane, he was in such extreme poverty as to be grateful and glad for an asylum, even in a madhouse and under strict restraint. Left an orphan at a very early age, he was given into the care of a friend of his father, who so ill-treated him, that, unable to support his cruelties, he ran away to Paris. In a few days, he was penniless; and being without resources, was taken up as a vagabond, and condemned to six months' imprisonment. Overwhelmed with grief and shame, he fell dangerously ill, his illness being so long and severe that, when the time of his release came, he had earned only six francs. (French prisoners are allowed to amass a reserve fund, to be given them on their release.) As this sum only lasted a few days, P—— was again brought before the police magistrates for vagabondage; but this time, the magistrate, pitying his sad fate, gave him only one month of imprisonment. There at La Force, he met with the temptations usually besetting the young and uncorrupted from the old and hardened jail-birds; but though unfortunate, he was honest, and refused to be tempted into evil ways. As there was no separation, either by night or day, and no discipline of any kind in French prisons a few years ago—little enough of either even now!—the unhappy lad had an awful probation to go through. The scorn, and the scoff, and the butt of the whole reckless set all day, he was not left in peace even at night; so that a month or two longer of that pandemonium must either have killed or broken him. When released, seeing himself again without resources, help, or prospects, having nothing but crime or the prison again between him and starvation, he resolved on suicide, as the only way out of his miseries. Again he was arrested, just in time to prevent that self-murder; and this time was locked up as a madman, on the plea that suicide must include mental alienation.

A physician of high standing, good fortune, apparently good health, and domestic happiness, one day was found self-murdered in his own room. All his preparations had been made with the utmost calmness and deliberation; he had himself written out his will a short time before, had regulated his affairs, and provided for his only son, to whom he was tenderly attached. There was no sign of mania or of unreflecting haste in his act; it was a quiet, deliberate, self-possessed, and self-conscious deed, which no one could call madness or imbecility; but for which no one could assign a reason, till an intimate friend of his, a physician whom he had consulted, told how he had been tormented by an ocular hallucination, which never left him, and which destroyed his happiness and peace of mind. Wherever he went—in the street, in the drawing-room, by the bedside of his patients, before the altar—wherever he might be, he always saw a huge black cow threatening him with her horns. He was quite aware of the nature of the deception, and treated

himself as he would have treated an ordinary patient. His friend, too, prescribed for him; but the black cow with her threatening horns still remained by his side. Unable to bear the distress of her presence any longer, he committed suicide, to the utter amazement of all who knew only his quiet, useful, intellectual, and noble life. A like case was that of a lawyer, a man of singular perception and justness of observation; eminently a lawyer, with all the logical acumen and critical sharpness of his class. He was haunted by an immense black cat which never left him; after a time, the cat changed into a sheriff's officer, in full official costume, who always preceded him, especially up stairs when going to any ball or fête, making as though about to announce him to the company. This went on for some years, when came a period of total cessation. The poor lawyer was in the seventh heaven; he believed that he had conquered his enemy; when one day opening his eyes, he saw a loathsome hideous skeleton standing where the sheriff's officer had been. From this last and worst visitation there was no escape, and the poor wretch died, incapable of supporting such a weight of misery in his life.

Suicide is fatally hereditary. Gall knew a family of which the grandmother, sister, and mother all killed themselves; and the son and daughter of the last followed in the same terrible track. Another family of seven brothers, all well off and in good positions, committed suicide one after the other in the space of forty years. Two brothers, twins, both in the army, and both happy and prosperous, committed suicide within a few days of each other; and two of their sisters were only prevented by force from doing the same thing.

A rich merchant, passionate and tyrannical, had six children, whom he sent away from home, well provided for, as soon as their education was completed. The youngest son, when twenty-six years old, threw himself from the roof of the house; the second brother died of obstinate abstinence the year following; the year following that, another brother had a fit of madness, in which, however, he was prevented from accomplishing the suicide he attempted; a fourth brother, a physician, who foresaw and felt powerless against his fate, killed himself; two or three years after, a sister became mad, and attempted suicide; and some years after that, the last brother, who was at the head of a large business, and who had been kept from the same horrible fate only by his wife's cares and tenderness, finished, like the rest, by self-murder. Thus, of the whole family, only two escaped suicide, and those two were confessedly mad, and therefore protected against themselves.

But what is called 'hereditary tendency' is often a mere matter of imitation, or of fancied hereditary necessity; indeed, imitation is the cause of more crimes, suicides, and even madness, than any other one faculty of human nature. The following is an instance:

A lady, aged thirty-five, was taken to the hospital in a state of melancholy mania. She was married, and the mother of children; but she was afflicted with the constant feeling of a necessity to commit suicide; this feeling having been induced by the fact, that her father and uncle had both done the same, and that she was therefore doomed by 'hereditary predisposition.' With this feeling, she wrote a letter to her mother announcing her intention, and then rushed into the river hard by. She was immediately rescued, and from that night became melancholy and monomaniacal, with the incessant impulse to self-destruction. At last her mother decided on the revelation of her lifelong secret; her daughter was not the child of her husband, but of a man in whose family was not the shadow of suicidal tendency. The lady had an interview with her real father, and from that hour recovered both her sanity and her health, never again

to be tormented with the desire of self-destruction, on the plea of a false hereditary predisposition. So much for imitation and fancy.

A priest, opening a letter, swallowed the wafer, without thinking of what he was doing. 'Take care,' said a friend, laughing; 'you have sealed up your inside!' The poor man took the jest seriously, went home, and killed himself by starvation; believing that he had positively sealed up his intestines, and that it was superfluous, and would be painful to eat.

We conclude this paper by a summary of results which it will be well worth the reader's while to remember: 1. That suicides are on the increase generally, but specially in France; 2. That the suicides in France greatly outnumber those of any other country in the world; 3. That they are not always attributable to mental affections, nor yet to physical sufferings, though suicides from these causes constitute a special branch of medical science; 4. That they are in ratio with the increase of civilisation and the diffusion of a certain kind of education—that kind which taxes the intellect too heavily while leaving the physical nature uncared for; 5. That they spring from moral and social causes chiefly—of course always excepting special disease—and are therefore to be dealt with and destroyed by a healthier system of public education and sounder views of social life. The extreme development of the nervous system, to the loss of muscular power and physical harmony generally, has tended to the increase of suicides; the over-cultivation, too, of the intellectual faculties in the young has been another fertile source of the same evil. The best and truest checks, therefore, to be given to this sad practice are—the returning to a more natural and more healthful system in the nursery, the school-room, and the forum, so that children and youths may no longer die from over-excited intellects, nor men cut short their days from social weariness or artificially induced disease.

THE FIRST AÉRIAL VOYAGE IN ENGLAND.

DURING the whole of the year 1784, the good people of London were greatly agitated upon the novel subject of balloons. Reports of Montgolfier's doings across the channel had raised the curiosity of our wonder-loving grandfathers to the highest pitch; and amid all the din of the great Westminster election, and the rest of the political turmoil of that eventful year, we find the popular mind constantly recurring to the topic with an excitement which is scarcely intelligible to a generation familiar with the mightier glories of steam and the telegraph. The new-born science of aërostation had not then achieved its barren honours, and become the costly pastime of our day. No invention, perhaps, in the history of man had opened to the imagination so many brilliant promises. The papers were filled with curious speculations upon the uses to which the newly applied principle might be put. Bishop Wilkins's favourite theory of a voyage to the moon was seriously revived by more than one enthusiast. Others, less sanguine, were content to congratulate themselves upon the great discoveries in astronomy which must necessarily result from a nearer view of the planets; while the more practical anticipated a time when aërial navigation would supersede the commerce of the seas, and drive the flying wagons from the Great North Road. Ballooning became quite a fashionable mania. Little balloons of painted silk, in all kinds of gay and quaint devices, floated about in boudoirs; and questions concerning the varieties of 'inflammable airs' and the 'elasticity of vapours' formed subjects of drawing-room discussion. Experiments with fire-balloons upon Montgolfier's principle were so common, and caused so many fires, that the

City authorities were compelled to prohibit the practice. Rumours of approaching ascents were always in circulation. Intrepid 'air-voyagers' were constantly about to ascend, first at Kensington, then at Greenwich, and afterwards from Whitehall Gardens; but somehow or other, either the gas or the courage of the artist was sure to ooze out at the last moment, and the event never came off.

Among those who were greatly interested in the experiments at Paris was Vincent Lunardi, a young Italian attached to the Neapolitan embassy. He had dabbled a little in aërostatics with Zambeccari, and had conceived an ardent ambition to be 'the first navigator of the English atmosphere.' His scientific acquirements do not appear to have been very extensive, and his variations from the track of the French discoverers were few and questionable. It was said by his enemies, that he was 'more of the showman than the savant,' and it is probable that notoriety rather than science was the object of his courtship; but at anyrate, we cannot refuse him the credit of being the pioneer in an enterprise requiring skill and courage in no small degree. Sir Joseph Banks, the president of the Royal Society, and Dr Fordyce, the eminent chemist, were among those who interested themselves in his work, and to them he was indebted in a great measure for its successful issue. Early in July, Lunardi informed the public that he was constructing a balloon in which he intended to ascend from the gardens of Chelsea Hospital. 'The gallery, oars, and wings,' said the advertisement, 'are already made, and to be seen at the Lyceum in Exeter Change, Strand, where the balloon is now making, and will be finished in about a fortnight.' At the same time, in order to defray his expenses, which had been heavy, he issued tickets of admission to the ascent at a guinea and half-a-guinea each. Before the end of the month, however, he had the mortification of seeing a rival candidate enter the field. A Frenchman, named Moret, had also completed a balloon, and fixed the trial for the 12th of August, the day before Lunardi's. His announcements drew together a vast concourse of people, who patiently watched the preparations from one till four o'clock; and when every effort was seen to fail, and the balloon at last sunk into the fire which ought to have expanded it, the mob, conceiving the whole affair an imposture, broke into the enclosure, tore up the apparatus, and destroyed a great amount of property in the neighbourhood. Lunardi chuckled finely over this catastrophe; but his triumph was short, for the governor of Chelsea Hospital, fearing a repetition of the riot on the morrow, immediately wrote to countermand his permission for the use of the gardens; and so his ascent had to be indefinitely postponed. It was in vain that he solicited private proprietors: the risk of a failure—and in that case, the certainty of the mob—prevented all negotiation. At length, after many wearisome delays, he obtained leave from the Artillery Company to ascend from their ground in Moorfields; but he was compelled to find sureties for any damage that might happen to the property; and even with these precautions, so great was the prejudice against him, that the permission was only carried in the council by the casting-vote of Sir Watkin Lewis, the colonel. The day was fixed for the 15th of September; but at the last moment another difficulty arose. The unpaid proprietor of the Lyceum, who had made a profit of the exhibition, was unwilling to lose his chance of present, and all future advantages to be derived from it. Such monstrous extortion was of course refused. Sir Sampson Wright, the presiding magistrate of Bow Street, ordered it to be forcibly removed.

possession; and after a desperate struggle between the police and the employes of the Lyceum, it was safely lodged in the artillery-ground the day before the ascent.

Next morning, all London was on the move towards Moorfields. By twelve o'clock, the large square, or rather parallelogram, which formed the fashionable promenade of old London, and is now occupied by Finsbury Circus and the adjacent streets, was one mass of human beings. Every roof and window from which a view could be obtained, was thronged with eager gazers. Along the front, and towering high above the whole scene, were the gloomy buildings of the old Bedlam, the wretched inmates of which were allowed to be spectators, and exchange coarse ribaldry with the mob beneath. The fact of this vicinage, and the resemblance between Lunardi and lunatic, had been the themes of innumerable puns and witticisms for days past; and the populace, appreciating the joke, with rough humour, were continually roaring out to him to 'go inside.' The enclosure is occupied by the Artillery Company, under arms, and the subscribers who have paid for admission; but the prevailing fears have prevented many from attending. In the centre of the ground, warded on every side by strong barriers, is the balloon, which differs in many respects from the 'Great Nassau' and 'Royal Alberts' of our time. It is about 32 feet in height, and 102 in circumference, and is composed of alternate strips of blue and red silk, strongly incased in net-work. The gallery, or car, is a thick wooden box, suspended from the balloon by forty-five ropes, and decorated on either side with two large leathern wings—a pet invention of Lunardi's—which he imagines will enable him to steer his course through the new regions he is about to visit. Almost all the men of mark in politics or literature then in town were grouped around it, including among others the Prince of Wales, Fox, Sheridan, Burke, Sir Joshua Reynolds, and Sir Joseph Banks. Rogers the poet was also there; and his recently published *Table-talk* records an incident of the scene. Fox, growing impatient at the delay, put his hand to his watch and found another hand upon it, which he immediately seized. 'My friend,' said he to the owner of the strange hand, 'you have chosen an occupation which will some day be your ruin.' 'Oh, Mr Fox,' was the reply, 'pray forgive me, and let me go; I have a wife and six children starving at home.' Fox, always tender-hearted, slipped a guinea into his hand, and then released it. At the conclusion of the show, Fox was proceeding to look what time it was. 'Good God!' said he, 'my watch is gone.' 'Yes,' said his brother, General Fox, 'I know it is. I saw your friend take it.' 'Saw him take it, and made no attempt to stop him!' was the indignant response. 'Really,' said General Fox, 'you and he appeared to be on such good terms, that I did not choose to interfere.'

It is now half-past one, and Dr Fordyce is still engaged in filling the balloon with 'inflammable air,' through a complicated arrangement of leathern nooses. The gas itself is hydrogen, manufactured from an infusion of zinc in vitriolic acid, the properties of common coal-gas being then unknown. Lunardi and Mr Biggin, the gentleman who is to accompany him, are busily engaged in completing their preparations; and the visitors around them, with true English love of betting, are giving and taking the odds about the probability of their return alive. The hour fixed for the ascent is passed; and the mob outside, pent up in narrow quarters since an early hour in the morning, are beginning to get clamorous. Dr Fordyce thinks the balloon is not sufficiently inflated to take up its freight, for at present it is only pear-shaped; but with the horrid populace in prospect, it is not considered advisable to wait any longer. Lunardi and his friend jump into the car; there is an anxious pause,

and after a moment's vibration, the cumbrous machine reclines heavily to mother-earth. A murmur of dissatisfaction runs through the assembly, and each man begins to feel himself duped. Already the sensitive aeronaut hears his ascent pronounced an imposition, and himself branded as a swindler. All is confusion and uproar, for the hoarse roar of the living sea without threatens havoc, and the courtiers are entreating the prince to leave the ground. 'The displeasure hanging over us,' says Lunardi, 'would have been fatal, if in one moment Mr Biggin had not had the heroism to relinquish, and I the resolution to go alone.' A smaller car is hastily substituted, and, half-dead with his many anxieties, he rushes into it. There is a warm farewell from his personal friends, for every one looks upon his return as very problematical. The prince and all the company with one accord take off their hats; the ropes are cut, and with the boom of the signal-gun, the first English balloon rises buoyantly into the air amid the frantic acclamations of nearly 200,000 spectators, who only a moment before had been indulging in the loudest shouts of menace. 'Insensible,' said the *Morning Post* of the next day, 'must that heart be which did not feel itself anxious and interested at that moment for the fate of him who intrepidly stepped into his seat, and, Phaeton-like, seized the reins which were to guide the chariot of the sun.'

At the distance of about twenty yards, it descended towards the ground; but, continues the reporter in the same style, 'roused by ambition and spirit of philosophical researches, Mr Lunardi rebuked its fear, and gave swiftness to its airy flight.' In the account of his trip, which Lunardi published soon after, he enters at length into his sensations. 'I saw,' he says, 'all London beneath me like an enormous beehive, but the industry of it was suspended. All the moving mass seemed to have no object but myself; and the transition from the suspicion and contempt of the preceding hour, to the affectionate transport, admiration, and glory of the present, was not without its effect on my mind.'

He tells us that the critics are wrong in holding terror to be an ingredient in every sublime sensation, for he was never freer from apprehension in his life, and speaks in ecstasies of the motion, compared with which 'the broom-sticks of the witches, Ariosto's flying-horse, and even Milton's sunbeam conveying the angel to the earth, have all an idea of effort, difficulty, and restraint.' At half-past three he descended in a cornfield near South Mimms in Hertfordshire, where he landed a cat that he had brought with him, and again reascended. He contrived to bring himself down by working with his oars, and had therefore expended none of his gas. After an hour's further journey, during which he wrote and threw down several letters to his friends, he finally lowered himself over a meadow in the parish of Standon, near Ware. Some labourers were at work underneath him, and Lunardi begged their assistance to secure the balloon, but they all appeared horror-struck, and refused to move. One excused himself because he was too short; another said he did not like the look of it; and a third honestly declared he would have nothing to do with one who came on the 'devil's horse.' Upon his nearer approach, they fairly took to their heels; and the disembarkation would have been attended with great danger, had it not been for the spirit of a young girl who grasped a rope which Lunardi threw her, and held it till General Smith and other gentlemen who had followed him from London on horseback came up. The new-comers aided in securing the machine, and bore off Lunardi in triumph to the Bull Inn at Ware, and afterwards to Bayford Bury, the seat of Mr Baker, the member for Hertford.

Such was the prosperous ending of the first aerial

excursion in England. Lunardi, of course, became the lion of the town. The journals were filled with odes in praise of his daring; the king sent for him to court, and the lord-mayor feasted him in the City. In the curious little brochure published on the occasion, he recounts with great gravity many incidents connected with his journey. While he hovered over London, George III. was holding a cabinet council. On being told the balloon was passing, his majesty said: 'We may resume our deliberations at pleasure, but we may never see poor Lunardi again.' The conference immediately broke up, and the king and Mr Pitt took to their telescopes. One young lady mistook one of the oars which he accidentally dropped from the balloon for the aeronaut himself, and was so affected with the circumstance, that she took to her bed and died soon after. A judge to whom he mentioned this circumstance at the Mansion-house dinner, told him not to be concerned at the loss he had occasioned, for he had undoubtedly saved the life of a notorious house-breaker, whose jury were so amazed at the novel sight over the Old Bailey, that they incontinently returned a verdict of acquittal.

The success of his first attempt induced Lunardi to make several other trials in various parts of the kingdom. The year following, he went to Edinburgh, where he made two ascents from the gardens of Heriot's Hospital, the last of which considerably cooled his passion for aeronautics, as the winds being unpropitious, he fell into the sea near the Isle of May, and after a bath of many hours, was picked up by some fishermen, half-dead with cold and hunger.

THE MONTH:

SCIENCE AND ARTS.

ONE of the chief scientific incidents of the past month was the 'Greenwich visitation,' as it is called—that is, the annual inspection of the Greenwich Observatory by the Board of Visitors, most of whom go down, a comfortable party, in the Admiralty barge, and dine together after their official business is over. The Astronomer Royal in his Report on what has been done since the visit in 1856, tells them that the work of the observatory is progressing satisfactorily—that the new dome for a new class of equatorial observations will be completed this summer—that suspending the quicksilver trough of the reflex zenith tube by straps of vulcanised caoutchouc 'has been perfectly successful; the tremors are absolutely destroyed, and the star has been observed at all hours of the night and day.' And as regards the transmission of time by telegraph, he says: 'Five clocks are in sympathetic movement in the observatory—one at the Hospital Schools, and one in the North Kent Station at London Bridge. That for signals has received this slight alteration, that the pull of the Time-ball Detent now alters the connections of four triplets of springs. Of these, one controls the communications with the Electric Telegraph Company's office at Lothbury, by which hourly signals are sent on various railways; the time-balls at the Strand, Cornhill, and Liverpool are dropped; and the Post-office clock in Lombard Street is regulated. A second affects the communications with the South-eastern Railway station, by which hourly signals are sent on various lines in Kent, and the time-ball at Deal is dropped, and returns its signal to acquaint us with its successful drop. The third and fourth are reserved for the prospective wants of the royal dockyards; they communicate with the Admiralty wire of the British

Telegraph.' It is probable that a time-ball will be erected at Devonport, the possibility of dropping such a ball by a flash from Greenwich having already been demonstrated. The Astronomer Royal still, as last year, refers to certain mysterious changes of level and direction of one of the instruments, one occurring with changes of temperature, the other at the equinoxes, and he still imagines some movement of the earth itself to be the cause of these remarkable phenomena.

There is to be a better education for officers in the army. No more getting commissions by favour; no more scandals about silly enigmas; but real practical ability, and thorough knowledge of military science, are to be the rule. Above all, we want competent officers in India. As regards art-education, the South Kensington Museum is open, and whosoever will may now inspect its valuable contents at pleasure. It is about three-quarters of an hour distant from Trafalgar Square, so that working-men could hardly resort to it without giving up half a day. But the view of the buildings and the grounds, well repays the time and labour. Comprised in that museum, are the Department of Science and Art from Marlborough House; an educational department, exhibiting all the appliances of teaching, and a good library, well arranged; the collections made by the commissioners of patents, all sorts of models and machinery; a trade collection; an Economical Museum; and the Sheepshanks collection of pictures, 234 in number. The effect of the whole is admirable, so good is the general arrangement. It will look yet richer when the articles lent to the Manchester Exhibition shall be returned. On Monday, Tuesday, and Saturday, and on Monday and Thursday evenings, the museum is open to the public; on the other three days of the week—students' days—there is a charge of sixpence for admission; and the catalogue costs only a penny. A comfortable kind of inauguration took place; Dr Lyon Playfair, president of the Chemical Society, gave his soirée in the museum, to the fellows of the Society, and a troop of savans besides, and for once, everybody had room enough.—May we not complete this paragraph on education by a specially noteworthy fact: eight bills have been brought into the House of Lords as a beginning in the long-talked-of and much-wanted work of codifying our laws. Should it please our legislators to pass them, the fifty volumes of statutes will be reduced to two or three.

The Architectural Museum lately kept at Cannon Row, Westminster, is also removed to South Kensington.—The Horticultural Society, after a lapse of two years, have again given one of their attractive flower shows at Chiswick.—Thirty-two thousand persons visited the Zoological Gardens during three days of Whitsuntide; more than ever before.—The visitors last year to the British Museum numbered 361,714; in 1854, the number was 459,262. Visits to the reading-room were less numerous than in former years.—The local committee of the American Association for the Advancement of Science at Montreal, have sent invitations to certain savans in this country to attend their meeting in August, accompanied by an offer of a free passage there and back. We hear that an eminent geologist and some of his friends have accepted the invitation.

A new magnetic survey of the British Islands is being made, whereby to discover and determine what changes have taken place in the phenomena of terrestrial magnetism since the former survey by General Sabine in 1827. Mr Welsh, of the Kew Observatory,

conducts the observations in Scotland, Sir James Ross in England, and Rev. Dr Lloyd in Ireland; names which are a sufficient guarantee that the work will be well done. When done, there will be valuable data at hand for Professor Hansteen of Christiania, who, as our readers are aware, has been for some time engaged on a theory of terrestrial magnetism derived from actual observation. About a year ago, he wrote to the Astronomer Royal, stating that the dip, as recorded at Greenwich, was much more in amount than, according to theory, it ought to be. The Greenwich dipping-needle was thereupon examined, and found to be extremely defective, depriving observations made with it of their value. It was at once rectified, with the effect of shewing the dip to be the same as inferred by Professor Hansteen. The publication by General Sabine of his third volume of *Toronto Observations* is opportune, as it contains a comprehensive review of all the phenomena of terrestrial magnetism.

Specimens of sheet-iron have been laid before the Franklin Institute at Philadelphia, described as 'gum elastic coated and impregnated iron,' which is said to be better for roofing purposes than any other kind hitherto invented. No galvanic action takes place between the iron and the coating; hence disturbing influences of that kind are avoided. Sir Benjamin Hall has confessed before the House of Commons that the galvanised iron roof of the great Westminster Palace is beginning to shew signs of rust. It might be worth inquiring whether the gum elastic coating and impregnation would afford the desired protection. —We hear that the iron trade is so good in Wales, that new furnaces are being built at Dowlais, by which the manufacture will be doubled, hundreds of tons of bars rolled every week, and additional employment afforded.

Many a visitor has gone down to the Isle of Dogs to look at the *Great Eastern*, without at the same time noticing thirty 'hopper barges,' built of iron, dredging the Danube, in accordance with the terms of the treaty recently made with discomfited Russia. They are constructed with trap-doors in the bottom, for the discharge in deep water of the sand and gravel raised from the shoals.—And this reminds us that the Netherlands Land Company have just reclaimed seventeen hundred acres of land, which with the former reclamation makes a total of nearly three thousand. Their operations are carried on in the shallow channel which separates South Beveland from the mainland in the estuary of the Scheldt. And there is talk of reclamation at the mouth of the Mersey, as may be seen in a Report just published by Mr George Rennie, the engineer. The project is, to build a breakwater out from Rock Point, on the Cheshire shore, across the shoals to a distance of three miles, the end to finish with a light-house. By the protection of this breakwater, it is estimated that from 80,000 to 40,000 acres of land will be won from the sea. Then, on the Lancashire side, a sea-wall is to be built of the same length, and behind that there will be a saving of 2000 acres: hence the value of the land is no unimportant item in calculating the work. The form of the wall and of the breakwater will be such as to make a trumpet-mouth to the river, whereby the navigation will be greatly facilitated, and ample protection will be given to the North Docks at Liverpool, which now are scarcely accessible in blowing weather. And besides, wrecks will be prevented, and the cost of steam-tugs saved, which is also no unimportant item in a port entered every year by 40,000 ships, amounting in gross burden to 4,000,000 tons. What has been done, and is still being done at Portland and Holyhead, shews how easy it is to build a breakwater far out to sea; and we should like to see the project carried out. Liverpool so completely outshines London in all that belongs to her river,

that it is about time the metropolis should be shamed into doing something to remove the reproach from the Thames.

Among proceedings in geology, we find something interesting in the researches of Baron de Beust, chief director of the mining department in Saxony, who has been led to the conclusion that minerals are diffused throughout his native country, and Europe generally, according to certain simple laws. He shews that the porphyry veins of Saxony run in lines corresponding to the direction of the mountain-ranges; and wherever porphyry is found, it is an indication of the presence of useful minerals. Taking Europe at large, he finds three principal metalliferous zones; the first, commencing in Bessarabia, runs through Hungary, Saxony, the Hartz, and across the Channel, to the lead-districts of Derbyshire and Cumberland; the second begins near Lisbon, and ends in Transylvania; the third, 400 miles in width, begins in the north-west of Spain, traverses the continent to Brittany, from thence to the smaller Channel Islands, touches South Belgium, and intersects the first zone. The tin of Saxony lies in the same line, as produced on the map, and runs from north-west Spain to Limoges; and 'a line drawn through the quicksilver deposits of Spain and Tuscany, if lengthened, will pass through Idria, and end in the veins of mercurial gray copper in Upper Hungary.'

Instructive facts these for mineralogists! Endeavours have already been made to turn them to account. Mines long neglected in Bohemia are to be reworked, for, with improved knowledge, geologists believe them to contain much undiscovered mineral wealth. That certain deposits take certain lines through the earth, has been for some time known. Haidinger shewed in 1849, that whenever boracic acid is found either free or combined with the rock, all the places lie on a line running north and south—from the Lipari Isles to Arendal in Norway. From the latter place, a branch shoots off to the west, and terminates in Salisbury Crag, Edinburgh. Other lines, which have been partially traced, favour the belief that extraordinary mineral deposits will one day be discovered in the Caucasus. It is a remarkable instance of commercial enterprise, that auriferous quartz is now brought from Virginia to Frodsham, in Cheshire, where it is calcined and crushed, and the gold is extracted at a profit, even should the yield be not more than an ounce and a half of gold to the ton of quartz.

In Paris, two ingenious Frenchmen have made a successful attempt to improve water-lenses. They have overcome the difficulties which have hitherto caused failure, and produce lenses, as we are told, which 'have the purity and perfection, nearly, without the cost of lenses of solid glass.' This success is likely to prove beneficial in more ways than one; for a water-lens properly illuminated will send its light to a distance of ten or twelve miles—the very thing, as it would seem, for railway signals, and for ships navigating the Channel.

A desideratum long sought for has now been achieved—that is, a means of perfectly cleaning articles of silver without injury to the metal. It is the discovery of Professor Böttger, a German. Take a glass or glazed vessel sufficiently large for the purpose; fill it with a strong solution of borax or of caustic potash; drop into it an inner vessel made of zinc, and pierced with holes as a sieve. Then take your silver, plunge it into the liquid, moving it up and down, being careful that at each plunge it comes into contact with the zinc. The effect is magical; for under the combined action of the solution and of the electricity evolved by the contact of the two metals, the silver loses all its dirt and discolorations, and becomes as bright as when first manufactured. Should it not be convenient to use the inner vessel of zinc, the cleansing may be accomplished by sinking

the silver in the solution, and stirring it about with a small rod of zinc. It is essential to success that the two metals touch each other frequently.

ADVICE TO YOUNG WORKING-MEN.

Join a benefit club; you will not miss the periodical contribution you have to pay. Do not defer doing so because you are healthy now; there is no knowing how soon disease may prostrate your energy and strength. Never join a club the sole recommendation of which is the smallness of its contributions. Avoid a club held at a public-house; you will find it cheaper in the end. Have nothing to do with a society the contributions of which are all alike. The existence of such societies depends on the introduction of young and healthy members. See that the society is properly enrolled, and the affairs conducted by a committee of business-like and sober men. Do not throw yourself upon the funds every time you cut your finger, or wish for a week's holiday. Do not be content with providing against sickness alone; but provide a sufficient sum to be payable at your death, so that the wife you cherish may not have to find a home by marrying again when you are dead, or your children become chargeable to the parish, or dependent on the bounty of friends, simply because in life you have cared more for your own little comforts than for their future welfare. Do this, and when the last hour comes, and you have to wrestle with the angel of death, the pang will be lessened by the knowledge that those you have loved and are leaving are provided for by your own forethought; and the memory of your kindness and your love will continue as green as the grass which waves above your pallid head.—*Benefit and Sick Clubs: their Ruinous Condition and Causes of Failure.* By Charles Hamilton, Sheffield.

THE LATEST NEW THING.

A spider-tank is the last novelty, and likely to be the most popular one introduced. It should be furnished with a perforated glazed top, and be not less than ten or twelve inches high, formed upon a square base of some six or more inches. The one we have, says a correspondent of a contemporary, contains three dozen spiders, acting, like a body of ants, or like a hive of bees, under a chosen ruler, and the arrangement of the nest and the formation of the web have been the work of the most perfect subdivision of labour, each individual spider performing its allotted task, without interfering with that of its neighbour. The *Argyroneta Aquatica*, the diving water-spider, when isolated from its companions, builds a cup-like nest close to the top of the water, and the membrane which surrounds the body being transparent, when inflated with air, assumes the appearance of a glittering metallic substance. So charged, the spider descends to the bottom in search of prey, but frequently is itself devoured by fish before it reaches its destination. To guard against this, nature has taught it that unity is strength, and when acting together in a body, the web is so strong, and of such dimensions, that fish themselves are entrapped, and become food for the colony. The immense activity of the spider, continually ascending and descending, glittering and bright in its airy dress, makes it one of the most amusing additions to the vivarium, and the spider-tank guards it from the danger to which it is subject if placed within the general aquarium.—*Newspaper paragraph.*

A NEW KIND OF DIAMOND.

That diamond is nothing but the substance of charcoal, or carbon in a crystallised state, is a fact pretty generally known; but that there is another elementary substance, called *boron*, which bears a strong analogy to carbon, is less so, perhaps, because boron has hitherto been obtained in such small quantities, that it is still a curiosity even in the laboratory of the chemist. MM. Wohler and Deville have lately made most interesting experiments upon this body, from which it appears that it can exist in three states, exactly corresponding to those of carbon—namely, the amorphous, the graphitic, and the crystallised state. In order to obtain the latter, 100 grammes ($3\frac{1}{4}$ ounces)

of boric acid and 80 of aluminum are exposed, during hours, to a violent fire in a black crucible coated with charcoal-powder. The mass is then left to cool; and breaking the crucible, two distinct strata come to light—one consisting of vitrified boric acid, or boracic acid, containing some alumina; and the other of aluminum in a metallic state, mixed up with crystals of boron. To separate the latter, this metallic mass is treated with strong caustic soda, to dissolve the metal; then with hydrochloric acid, to carry off the iron which may have been separated from the plumbago of the crucible; lastly, with a mixture of nitric and hydrofluoric acid, to dissolve the silicium left by the soda. After this, the boron is obtained pure in three varieties of crystals—namely, Black and opaque laminae, which will cut diamond, the not so well as diamond-powder: 2. Long prismatic crystals, perfectly transparent, and as brilliant as diamonds, not so hard as the former variety; if without flaws, they might be used for jewellery: 3. Very minute but distinct crystals of a red chocolate colour, and quite as hard as diamond. They may be used as diamond-powder, and give a fine polish.—*Galignani's Messenger.*

ON RECEIVING A BASKET OF VIOLETS IN WAX.

WHERE, oh where do the violets dwell?
Sweet April breeze, I pray thee, tell!
Thou hast wandered far over vale and glen,
Ere thou hast entered the haunts of men;
Thou hast breathed on the wealth of the spring
young green,
Through sunlit valleys thy path has been,
Through copses where last year's leaves lie still,
Where the brambles dip in the wandering rill,
O'er wide green meadows, o'er bleak hillsides—
Tell me, sweet breeze, where do violets hide?

Down some quiet glen where the moss is deep;
At a gray rock's foot where the lichens creep;
Under branches gemmed with the morning dew;
In a bower of leaves which the sun glints through;
'Mong the thick gnarled roots of an old oak-tree,
Unvisited save by some wandering bee;
'Mid the deep wood-silence, unbroken all day,
Save by babbling brook or rustling spray;
Like a gem in the shade of its deep leaves set,
You may find the coy sweet violet!

Alas, for me! I may not go
Where the wild fern bends to the waters' flow,
Chained are the steps that would gladly roam
In the track of the breeze to the violet's home.
I dwell 'mid the tide of eddying life!
The very air with its sound is rife!
I may not leave these streets and walls
For lone wood-dells and water-falls;
So deep in its own sweet verdurous gloom,
Unseen by me, must the violet bloom!

Yet have I violets! See my prize!
Purple and white, with their golden eyes!
Violets vying with Nature's best,
Tenderly set in a mossy nest!
Better in this, that these dainty flowers
Fade not away with the fleeting hours;
But their beauty will last with the fancies they inspire,
Through rain, and tempest, and wintry days.
Then thanks, warm thanks, to the skilful hand,
And tenfold thanks to the heart that planned
This graceful gift! So these flowers shall be
Ever a source of sweet thoughts to me,
And though storms blow wildly, and skies are dim,
Shall bring dreams of spring-time through all the year!

KIRKE WEBBE, THE PRIVATEER CAPTAIN.

CHAPTER I.

I AM about to transcribe an episode in my youthful experience, which, though comparatively brief, if measured by time only, has so impressed and shaped my life—now past its sixth decade—that it stands out in the light of memory as a towering mind-mark, to which all subsequent events appear subordinate, and to which chiefly owe their form and colour, their shadows and their sunshine.

In that episode, Kirke Webbe, captain of the *Scout* privateer, was a prominent actor, and his character and history, as developed by the scenes in which I happened to be associated with him, possess, I think, an interest and value—especially now, when the species to which he belonged may be said to be extinct—apart from his influence upon my own individual fortunes. If, however, the ordinary sketches of his class which one meets with are to be deemed authentic portraiture, Captain Webbe, who was neither a vulgar ruffian nor a melodramatic hero, cannot be presented to the reader as an average specimen of the privateer. He boasted of having been a scholar of Christ's Hospital; was certainly well read in English literature; and his seamanship was acquired by six years' service in the royal navy as midshipman. Further than this, those of his deeds to which I am about in these pages to bear witness must speak for him; though, if proof of their verity is required, I can only refer to the internal evidence supplied by the narrative itself: if that suffice not, I have no other to offer, as I do not choose to publish my own real name.

All that I positively knew of myself, of my antecedents and belongings up to the second week in February 1814, may be shortly set forth. My name, we will say, was William Linwood. I was unquestionably a strapping fellow of my age—then a trifle over twenty years; and not absolutely frightful in features, or it could scarcely be an article of faith with me that Isle of Wight lasses, especially in and near Ryde, were, and doubtless still are, unless the presence of all-shadowing royalty has frozen the genial current of their souls, some of the sweetest-tempered damsels in creation. For the last ten or eleven of those twenty years, I had been domiciled at Oak Villa, near Ryde, on the road to Newport, with my grandmother, Mrs Margaret Linwood, one of the oddest, worthiest, and most absolute of womankind. My earlier years had also been chiefly passed with Mrs Linwood, though

not in the Isle of Wight, whither she removed some twelve months previously to the departure of my father and mother for the United States of America, in 1804, a destination they never reached; the vessel in which they sailed having been captured in the Channel by a French letter of marque, and carried into the port of Havre de Grace, in or near which commercial capital of maritime Normandy my parents had since been detained as prisoners of war, on parole.

This was pretty nearly all of our family history that my inexorable grandame had decided, in her peremptory have-done-talking-of-it sort of way, should be confided to me till I attained my legal majority; or the advent of peace permitted my parents to continue their voyage to America, and me to join them there—a return to England not being, it would seem, contemplated as a possible eventuality.

Meagre as was this information upon matters of such paramount interest for a son, I should have been happier, less irritable, captious, when the subject was incidentally alluded to, had not certain fragmentary images or impressions looming through the mists of memory, suggested an affrighting solution; the more affrighting because vague, dark, undefined—of the mystery before which the kindest hands in the world had drawn, and persisted in keeping drawn, an impervious veil.

I remembered that, in the far-off time, I had been the petted favourite of a tall, portly gentleman, living in a fine house; that I had frequently ridden with him in a glittering carriage, drawn by prancing horses, and usually accompanied by my mother, whose pale, pensive face, and soft, low, tearful voice, seemed ever as vividly present to me as on the night I was awakened to receive her farewell blessing previous to her departure with my father for America. The tall portly gentleman was, I knew, my mother's father, and for a time we were his only companions; but after a while, another lady and another child dwelt in the fine house, and rode in the glittering carriage with us; and I was finally carried off by Dame Linwood to her comparatively humble abode in South Wales, and never, that I could remember, had I seen the tall, portly gentleman again.

My mother came frequently to Llanberis, sometimes, not often, accompanied by her husband, whose image dwelt faintly in my memory. On one occasion, and the last time I saw him, he came alone. Evening was falling when he arrived, and I, then about six years old, was hurried to bed, but not so hastily as to prevent me noticing that he was strangely hurried, and that a few whispered words communicated his agitation to my grandmamma. His face, too, was

deathly pale, and, as I felt when he kissed me, cold as stone, like his hands.

Nancy Dow, my grandmother's confidential servant, looked as scared as they; and as she undressed, put me to bed, and kept guard over me, poured forth a torrent of talk, to drown, if possible, the sounds of weeping and lamentation, fitfully surging up from below.

She succeeded to a certain extent for a while; but ere yet—spite of her repeated entreaties that I would, like the good boy that I was, go to sleep—the slightest feeling of drowsiness had come over me, a loud, fierce knocking at the front door startled her into silence, as it did my relatives below, for the house was hush as death when the knocking ceased for a few moments, to be again and again renewed with increasing violence. Rude voices, too, made themselves heard from without, imperiously demanding admittance; and presently there was a crash of glass, as if the window had been broken through, followed by an explosion of discordant cries and exclamations. Nancy Dow flew down stairs, and I, not daring to get up, lay sobbing with terror, till the gradual subsidence of the incomprehensible tumult permitted slumber to weigh down my aching eyelids, and I sank into the dreamless sleep of childhood.

I was early awakened by poor Nancy, who had evidently not taken her clothes off, and whose very decided features were swollen by weeping into exaggerated unloveliness. She told me that my father and grandmamma were gone to London, and would not, perhaps, return for some little time; and I was emphatically cautioned not to speak of what had occurred the previous evening to the outdoor servants and helpers, when they came to their work—Mrs Linwood managed, and successfully, a very large dairy-farm of her own—nor express surprise at my relative's absence.

The memories of children, however precocious, and mine was remarkably so, rarely take note of periods of time; and I could not say how long—reckoned by days and weeks—Mrs Linwood, as I call her from habit—she having always greatly disliked to be 'grandmothered'—remained absent; but measured by my pining inquietude, a long, long interval of dreary time elapsed before she returned. And then how changed, even to my childish appreciation! It seemed that a sudden, untimely frost had frozen over the genial current of her nature. True, it still flowed with as kindly and generous a warmth as ever beneath the cold, stern surface; but she had, as it were, placed a barrier of ice between herself and a world in which she had no longer faith or hope.

What could have been the nature of the calamity that had so suddenly darkened good Mrs Linwood's clear noon of life?—for though a grandmother, she was considerably on the sunny side of fifty—was the question which, as the years grew on, and threw the light of their experience back on the scene enacted at Llanberris Farm on the evening of my father's last visit, incessantly pursued and harassed me.

I could not doubt that he had upon that occasion been subjected to legal arrest—for debt, mayhap! Strive as I might, it was impossible to hold to that precious suggestion. Many circumstances concurred to convince me that pecuniary difficulties had not been felt in our family. My father, who had never been in business, was neither a gambler nor a spendthrift. Mr Waller, the portly gentleman of my childhood, was

for many years invested upon an average £500 annually; she would have grudged nothing to her only son. No; they were not the agents of a grasping creditor, that had broken into our peaceful Welsh home in unscrupulous pursuit of their quarry!

He must, then, have been seized by officers of criminal justice. Yet had Mrs Linwood, when vehemently pressed by me to give some slight explanation of the occurrences of that memorable evening, declared that my father had never been arraigned for any offence whatever; and she was incapable of falsehood. Never arraigned for any offence! Those were her guarded words. The offence had perhaps been compromised—hushed up. Not a very serious one, then, or such a course would have been impossible.

No serious offence! A rotten cable that to hold by. Dame Linwood's inexorable silence—the expatriation of both my parents—the careful avoidance of my allusion to Mr Waller and his second wife, extinguished that hope as soon as it was formed.

An incident which occurred about six months previous to the before-mentioned second week in February 1814, threw a ghastly light over the mystery.

It was my father's birthday, and I was sitting with Mrs Margaret Linwood in the miniature drawing-room of Oak Villa, of which the French windows opened upon our finely cultivated pleasure-garden, and beyond commanded a splendid view of the silvery Solent. It was a cloudless autumnal evening; and the faint sea-breeze, which barely sufficed to dilate the white sails of the numerous sailing-craft afloat upon the glancing waters, was subdued by the time it reached us, laden with the rich perfume of flowers, to a fragrant caressing sigh, in unison with the serene—and to us, absorbed by the painful thoughts suggested by that particular day of the year—solemn silence that reigned around. My venerable relative, to whom those anniversaries were bitterly afflictive, seeming to tear open afresh the hidden wound that was slowly, but surely eating her life away, was more than usually sad and thoughtful, and for the last half-hour or so, not a word had passed between us.

She was sitting with her back towards me, according to her wont, when unwilling that I should observe the emotions that swept over the tablet of her face, which was, however, clearly revealed to me in a tall mirror opposite; and swift tears, I saw, were trickling through her thin white fingers.

Gently I ventured to approach the subject even, of late, uppermost in my thoughts.

'My grandfather, Waller, still resides, I presume at the house in Cavendish Square?' said I, my gaze the while intently fixed upon the mirror. There was a slight start, and the partially concealing hand was half withdrawn from the face. The emotion was but momentary.

'Your grandfather, Waller, still resides at the house in Cavendish Square,' was the quiet reply.

'With his second wife, Mrs Waller, of course!'

'With Mrs Waller, his second wife, of course! Captain Webbs met them, not long ago, in one of the parks.'

'Strange, was it not, that, having a grown-up daughter of his own, Mr Waller should have married again?'

'Not strange at all. He was not more than five or six and forty years of age; and Mrs Hamilton was a widow, not far off, I should think, of thirty. Time had dealt so gently with her, that she looked nothing like so old. A singularly beautiful woman,' added Mrs Linwood with a sigh, 'and beautiful in mind as person. The marriage was in all respects unexceptionable one.'

'You once shewed me her portrait: the expression it struck me, was a peculiar one—sweet, but sad.'

'True—a boy's fancy.'

'And the beautiful child, I so well remember, that— Good Heaven, what have I said—done?'

Lightning seemed with my words to have smitten my venerable relative. A sharp cry of anguish escaped her, and her face, no longer masked by her hands, which tightly grasped her bosom, was convulsed with horror.

I leaped to my feet in terrible dismay; but before, my confusion and affright, I could think of what could be done, or summon others to do it, straggled Mrs Linwood had, by a supreme effort, mastered her betraying outward self.

'Sit down!' she exclaimed with peremptory sternness. 'It was a passing spasm—nothing more. I must consult Mr Beale, for these attacks grow in frequency and violence of late. You may fetch me a glass of wine from the dining-room.'

'You were speaking, William,' said Mrs Linwood, she replaced the emptied glass upon the table, and with her face still carefully averted from me—you were speaking, William, of—of Lucy Hamblin—Mrs Waller's beautiful little girl. She died young—early in her fourth year.'

'Ha!'

'Yes: the sweet child was—was drowned in the tides, near Gravesend.'

'Drowned! By accident?'

'There are various opinions; I have mine—a decided one, but, unsustained by legal evidence, worthless of course. And now, my dear boy, go and send Nancy home: I do not feel quite well.'

This, as I believed, partial unveiling of the terrible secret, rendered further suspense insupportable. My heart was embittered, poisoned by it; and I passionately strove to know the worst. Mrs Linwood was deaf to my, unyielding as adamant to my supplications, and I was still, at the beginning of 1814, moodily meditating the probable motives for her obduracy—leaving, as usual, the cud of dark and bitter fancies—when my listless glance was arrested by an advertisement in the *Hampshire Telegraph* newspaper, stating that Mr Harrison of Portsmouth, the printer of that journal, had a complete file of the *London Times* from 1780 to 1802, to dispose of. Might I not, it instantly flashed across my mind—might I not find in the columns of that paper all that I longed to discover? I knew in what year, and at about what period in that year, my father's arrest had taken place. How was it that so obvious an expedient for ending the doubts and fears by which I was beset had not occurred to me before? At all events, it should not be neglected now; and an hour had not passed when I took boat at the old Ryde pier for Portsmouth.

The bargain with Mr Harrison was readily struck; and the coarsely bound broadsheets having been conveyed to the Blue Posts Inn, I was speedily glancing through the leaves with feverish impatience. The work was, I found, far from perfect; many numbers were missing of the most promising dates; and I was half inclined—partly from despair, partly from dread of finding what I sought—to give up the search, when my eye lit upon the following paragraph:

THE GRAVESEND TRAGEDY.—Mr William Linwood, who has been so long in custody, charged with the murder, by drowning, of the child Lucy Hamblin, was yesterday set at liberty, with the consent of the law-officers of the county, who have most reluctantly arrived at the conclusion, that in the absence of Mademoiselle Féron, who can nowhere be found or heard of, there is no legal evidence to sustain his detention. No moral doubt appears to be entertained by those who have investigated the circumstances, of Linwood's guilt; yet it is right to add, that he avowed himself asserts his perfect innocence with an earnestness which, combined with his previous excellent character, might weigh considerably in his favour, but for

the facts disclosed by Louise Féron during the tumult and agitation consequent upon the discovery of the dreadful crime—facts not the less morally conclusive that they were not declared, and have not since been confirmed upon oath. Mrs Waller, the bereaved mother, is, we are rejoiced to hear, recovering from the effects of the attack of brain fever, which it was at one time feared would have resulted in confirmed insanity.'

A vertigo seized me as I read; the dreadful lines swam, flashed as if written with fire, before my shrinking, blinded eyes. I had barely strength to close the terrible volume, stagger towards and ring the bell, and then dizzy, sick—sick, as if unto death, I fell senseless on the floor.

Upon recovering consciousness, I found myself lying upon a couch near an open window, and sedulously ministered to by the landlady of the Blue Posts and one of her sympathising handmaidens. The vertigo and sickness had passed away, and, thanking them for their kindness, I asked to be left to myself—a request which, after I had given proof of the repossession of my faculties by swallowing the greatest part of a glass of spirits and water, was complied with.

Well, I had thoroughly succeeded in plucking out the heart of the mystery! I knew now, as well as Dame Linwood herself, that my father was adjudged by public opinion to be a cruel murderer! Accursed knowledge! compared with which the carking anxiety I had previously suffered was happiness—felicity! By public opinion so condemned! True; but assuredly, also—and the blessed thought flashed like sunlight upon my troubled soul—assuredly justly judging, clear-headed Mrs Linwood did not believe him guilty! O no!—a thousand times no! And my own mother, the pure light of whose mild eyes sank so deep into my child's heart, that it still glowed there in undimmed, perennial brightness—she—I eagerly recalling to mind passages of her letters that I had been permitted to read—she, I knew, felt for her husband not love, compassion only, but respect, esteem, reverence.

Of what weight was rashly formed public opinion opposed to such testimonies? Not the slightest—of not a feather's weight; and, passing with boyish impetuosity from despair to exultation, I laughed, shouted, wept with the inexpressible joy springing from a devout, unshakable conviction of my persecuted, maligned father's innocence!

Innocence which it would be my duty, my high privilege to vindicate in the face of day before a misjudging world. I would hunt up the woman Féron—trace the atrocious calumny to its vile source! Success I could not doubt of, for I had faith in God and my own courage. But enough of these ebullitions of an undisciplined, puerile enthusiasm—an enthusiasm with which I was shocked to find Dame Linwood could not be persuaded to in the slightest degree participate. The discovery I had made through the newspaper pained, annoyed her, and she would add nothing to the information which I had, according to her, surreptitiously obtained. She knew nothing, could guess nothing of the whereabouts of the Frenchwoman Louise Féron; and any stir in the unhappy business by a rash, inexperienced boy could, she was quite satisfied, lead to no useful result. Her son's vindication would, she nothing doubted, be brought about in God's own good time; and for that time she, I, all of us must humbly wait.

The worthy dame's obstinate fatalism, as I deemed it, made me terribly wroth; but all the indignation and eloquence in the world would have been utterly thrown away upon her, but for an occurrence which startled her into a belief that the good time she prayed and waited for might be near at hand. That occurrence, launching me into a sea of perils, the shadows whereof, ever so faintly cast before, would, for all my

vapouring self-conceit, have given me serious pause, fell out thus oddly: it is not often that Fate knocks at one's door with so seemingly ludicrous a summons.

A WOMAN'S THOUGHTS ABOUT WOMEN.

FEMALE SERVANTS.

THOUGH female servants come under the category of handicraftswomen, yet they form a distinct class, very important in itself, and essential to the welfare of the community.

A faithful servant—next best blessing, and next rarest, after a faithful friend!—who among us has not had, or wanted, such a one? Some inestimable follower of the family, who has known all the family changes, sorrows, and joys, is always at hand to look after the petty necessities and indescribably small nothings which, in the aggregate, make up the sum of one's daily comfort; whom one can trust in sight and out of sight—call upon for help in season and out of season; rely on in absence, or sickness, or trouble, to 'keep the house going,' safe and right; and at all times, and under all circumstances, depend upon for that conscientious fidelity of service which money can never purchase, nor repay.

And this, what domestic servants ought to be, might be, they are—alas, how seldom!

Looking round on the various households we know, I fear we shall find that this relation of master (or mistress) and servant—a relation so necessary, as to have been instituted from the foundation of the world, and since so hallowed by both biblical and secular chronicles, as to be, next to ties of blood and friendship, the most sacred bond that can exist between man and man—is, on the whole, the worst fulfilled of any under the sun.

Whose fault is this?—the superior's, who, in the march of intellect and education around him, losing somewhat the distinction of mere rank, yet tries to enforce it by instituting external distinctions impossible to be maintained between himself and his dependents?—or the inferior's, who, sufficiently advanced to detect the weaknesses of the class above him, though not to cure his own, abjures the blind reverence and obedience of ancient times, without attaining to the higher spirit of this our day—when the law of servitude has been remodelled, elevated, and consecrated by Christianity itself, in the person of its Divine Founder. '*He that is greatest among you, let him be your servant.*'

This recognition of the sanctity of service, through the total and sublime equality on which, in one sense, are thus placed the server and the served, seems the point whereon all minor points ought to turn, and which, in the awful responsibility it imposes on both parties, ought never to be absent from the mind of either; yet it is usually one of the very last things likely to enter there.

To tell Mrs Jones—who yesterday engaged her cook Betty for fourteen pounds a year, having beaten her down from fourteen guineas by a compromise about the beer; and who, after various squabbles, finally turned out pretty Susan, the housemaid, into the ghastly Vanity-fair of London, for gossiping on area steps with divers 'followers'—or the honourable Mrs Browne Browne, who keeps Victorine sitting up till daylight just to undo her mistress's gown, and last week threatened, though she did not dare, to dismiss the fine upper-nurse, because, during the brief minute or two after dessert, when Master Baby appeared, mamma, who rarely sees him at any other time, and never meddles with his education, physical or moral, was shocked to hear from his rosy lips a 'naughty word'—to say to these 'ladies' that the 'women' they employ are of the same feminine flesh and blood, would of course meet nominal assent. But to attempt

to get them to carry that truth out practically—to own that they and their servants are of like passions and feelings, capable of equal elevation or deterioration of character, and amenable to the same moral laws—in fact, all 'sisters' together, accountable both to themselves and to the opposite sex for the influence they mutually exercise over one another, would, I fear, be held simply ridiculous. 'Sisters' indeed! Certainly not, under any circumstances—except when Death, the great Leveller, having permanently interposed, we may safely, over a few spadefuls of earth, venture to acknowledge 'our dear sister here departed.'

I have gone up and down the world a good deal, yet I have scarcely found one household, rich or poor, hard or benevolent, Christian or worldly, aristocratic or democratic, which, however good in outward practice, could be brought to own as a guiding principle, this, which is apparently the New Testament principle with regard to service and servants.

I neither seek to preach nor act equality; of all shams, there is none so vain as the assertion of that which does not, and cannot exist in this world, and which the highest religious and social legislation never supposes possible.

For instance, my cook prepares and sends up dinner. From long practice, she does it a hundred times better than I could do; nay, even takes a pleasure and pride in it, for which I am truly thankful, and sincerely indebted to her too; for a good cook is a household blessing, and no small contributor to health, temper, and enjoyment. Accordingly, I treat her with consideration, and even enter her domains with a certain respectful awe. But I do not invite her to eat her own dinner, or mingle in the society which to me is its most piquant sauce. She was not born to it, nor brought up for it. Good old soul! she would gape at the finest bon-mot, and doze over the most intellectual conversation. She is better left in peace by her kitchen-fire.

Also, though it is a real pleasure to me to watch my neat parlour-maid in and out of the drawing-room, to see by her bright intelligent face that she understands much of whatever talk is going on, and may learn something by it too sometimes; still, I should never think of asking her to take a seat among the guests. Poor little lass! she would be as unhappy and out of place here, as I should be in the noisy Christmas party below stairs, of which she is the very centre of attraction, getting more compliments and misletoe-kisses than I ever got, or wished for, in my whole lifetime. And, by the same rule, though I like to see her prettily dressed, and never scruple to tell her when she sets my teeth on edge by a blue bow on a green-cottee gown, I do not hold it necessary, when she helps me on with my silk one, to condole with her over the mild cotton, or to offer her the use of my toilet and my chaperonage at the conversazione to which I am going, where, in the scores I meet, there may be scarcely my face more pleasant, more kindly, or more necessary to me than her own.

Nevertheless, each is in her station. *Problems* fixed both where they are; and while they thus remain, and, unless either individual is qualified to change, neither has the smallest right to crossing the barrier between them—recognised, perhaps, *being* tacitly than openly by either—but never by any ridiculous assumption of equality denied or set aside. Yet one meeting-point there is—far below, at *least*, all external barriers—the common womanhood in which all share. If anything were to happen to my little maid—if I caught her crying over *father's* letter, or running in, laughing and rosy, after shutting the back gate on—somebody—I am *sure* my heart would warm to her just as much as *mine* never left my name at Buckingham Palace, or to do to a certain Lady there, who *talked*

and goes rides with her little children—apparently a better woman, wife, and mother than nine-tenths of her subjects. Yes; it is here, I think, the only true equality lies—in this recognition of a common nature; to the divinely appointed law of which all external practice is to be referred. Would that both mistresses and servants could be brought to recognise this equality—not as a mere sentimental theory, but as a tangible fact, the foundation and starting-point of all relations between them.

It concerns maids just as much as mistresses; and to them I wish to speak, more especially as among them this Journal circulates largely—at least, I have often found it, hid in table-drawers, and ‘steeling’ about dressers, or pored over of odd evenings when the kitchen was tidy and work was done. All the better: no mental improvement that is compatible with the duties of his or her calling, ought to be forbidden any human being.

I should like, first, to impress upon all women-servants how very much society depends upon them for its wellbeing, physical and moral. I am not afraid of thereby increasing their self-conceit: it is not responsibility, but the want or loss of it, which degrades character. To feel that you can be something, or might be, is often the first step towards becoming it; and I hold it safest, on the whole, to treat people as better than they are, if, perchance, conscience may shame them into being what they are believed, than to check all hope, paralyse all aspiration, and irritate them, by the slow pressure of contemptuous incredulity, into becoming actually as bad as they are supposed to be. Thus, if the young women to whom has fallen the lot of domestic service, of making homes comfortable, and especially of taking care of children, could once be made to feel their own importance as a class—their infinite means of usefulness—I think it would stimulate them into a far higher feeling of self-respect and true respectability, and make them of double value to the community at large.

What do you ‘go to service’ for?—wages of course: all you care for is how much money you can earn, and how easy a place you get for it. Character is likewise indispensable to you; so you seek out good families, and keep in them for a certain length of time. Meanwhile, the most energetic and sensible among you try to learn as much as lies in your way—but only as a means of bettering yourselves. ‘To better yourself’ is usually held a satisfactory reason for quitting the most satisfactory place and the kindest of mistresses.

On the whole, the bond between you and ‘missis’ is a mere bargain—a matter of pounds, shillings, and pence; you do just as much as she exacts, or as you consider your wages justify her in expecting from you—not a particle more. As to rights, privileges, and perquisites, it is not unfrequently either a daily battle or a sort of armed treaty between kitchen and parlour. The latter takes no interest in the former, except to see that you do your work and keep your place; while you on your part, except for gossip or curiosity, are comfortably indifferent to ‘the family.’ You leave or stay just as it suits them, or yourself, get through a prescribed round of work, are tolerably well-behaved, civil, honest—at least in great matters—and tell no lies, or only as many white ones as will answer your purposes. And so you go on, passing from ‘place’ to ‘place,’ resting nowhere, responsible nowhere; sometimes marrying, and dropping into a totally different sphere, but oftener still continuing in the same course from year to year, laying by little enough, either in wages or attachment; yet doing very well, in your own sense, till sickness or old age overtakes you, and then—where are you?

I have read somewhere that in our hospitals and lunatic asylums there is, next to governesses, no class so numerous as that of female domestic servants.

Remember, I am referring not to the lower degrees, but to the respectable among you—those who can always command decent wages and good situations, so long as they are capable of taking them. Of the meaner class, ignorant, stupid, drifted from household to household, from pure incapacity to do or to learn anything, or expelled disgracefully thence for want of (poor wretches, were they ever taught?) a sense of the common moral necessities of society, which objects to the open breach of at least the sixth, seventh, eighth, and ninth commandments—of these unhappy dregs of your sisterhood, I cannot now venture to speak. I speak of those, born of respectable parents, starting in service with good prospects, able, generally, to read and write, and gifted with sufficient education and intelligence to make them a blessing to themselves and all about them, if their intelligence were not so often degraded into mere ‘sharpness,’ for want of that quality—rare in all classes, but rarest in yours—moral conscientiousness.

Why is it that, especially in large towns, a ‘clever’ servant is almost sure to turn out badly? Why do mistresses complain that, while one can get a decent servant, a good-natured servant, a servant who ‘does her work pretty well, with plenty of looking after,’ a conscientious servant is with difficulty, if at all, to be found?

By conscientious, I mean one who does her duty—that is, the general business of her calling—not merely for wages or a character, or even for the higher motive of ‘pleasing missis,’ but for the highest of all motives—because it is her duty. Because, to cook a dinner, with care and without waste; to keep a house clean and orderly in every corner, seen or not seen; to be scrupulously honest and truthful, in the smallest as in the greatest things; to abstain from pert answers in the parlour, squabbles in the kitchen, and ill-natured tittle-tattle about her fellow-servants or the family—concern not merely her position as a servant, but her conduct and character as a human being, accountable to God as much as the greatest woman that ever was born.

‘Oh, that’s fine talking!’ you may say; ‘but what can I do? what can be expected of me—only a poor servant?’

Only a poor servant! Only a person whom a whole household is obliged to trust, more or less, with its comfort, order, property, respectability, peace, health—I was going to add life; who, in times of sickness or trouble, knows more of its secrets than nearest acquaintance; who is aware of all its domestic weaknesses, faults, and vexations; to whom the ‘skeleton’ said to be in every house must necessarily be a thing guessed at, if not only too familiar; on whom master, mistress, children, and friend must be daily dependent for numerous small comforts and attentions, scarcely known, perhaps, until they are missed. Only a poor servant! Why, no living creature has more opportunity of doing good or evil, and becoming to others either a blessing or a curse, than a ‘poor servant!’

Not if she is a mere bird of passage, flitting from roof to roof, indifferent to everything save what she may pick up to feather her nest with by the way. Not if she starts with the notion that ‘missis’ and she are to be always at war, or on the alert against mutual encroachments, anxious only which can get the most out of the other. Not if she takes to fawning and flattering, humouring her mistress’s weak points, and laughing at her behind her back, betraying the follies or misfortunes of one household into another; carrying on a regular system of double-faced hypocrisy, and fancying she is getting her revenge, and degrading her injurers, when, in fact, she more, much more, degrades herself.

These are the things which make servants despised; not because they are servants, but because the most

of them, if they assume any moral standard at all, hold one so far below that of the class above them, that this class learns to regard and treat them as an inferior order of beings.

'What can you expect from a servant?' said to me a lady with whom I often used to argue the matter—a good and noble-minded woman, too, among whose few prejudices was this, fixed and immutable, against the whole race of domestics.

What do I expect from a servant? Why, precisely what I exact from myself—the same honesty of word and act, the same chastity and decency of behaviour, self-government in temper and speech, and propriety of dress and manner according to our respective stations.

Therefore, in any disputed point, I, as being probably the more educated, older, if not wiser of the two, feel bound as much as possible to put myself in her place, to try and understand her feelings and character, before I judge her, or legislate for her. I try in all things to set her an example to follow, rather than abuse her for faults and failings, which she has sense enough to see I am just as liable to as she. I would rather help her in the right way, than drive her into it, whip in hand, and take another road myself. Reprove, I ought, and will, as often as she requires it; but reproof is one thing, scolding another: she should never see that I find fault merely from bad temper, or for the pleasure (?) of scolding. Authority I must have: it is for her good as well as mine that there should be only one mistress in the house, to whom obedience must be implicitly rendered, and whose domestic regulations will admit of no idleness, carelessness, or irregularity; but I would scorn to use my authority unjustly, or wantonly, or unkindly, simply for the sake of asserting it. If it is worth anything in itself, she will soon learn that it is not to be disputed.

And generally, rule, order, and even fair reproof, are among the last things that servants complain of. Selfishness, stinginess, want of consideration for others, are much oftener the fruitful source of all kinds of domestic rebellion, or the distrust which is worse than any open fight—the sense of gnawing injustice which destroys all respect and attachment between 'upstairs' and 'downstairs.'

And yet the servant is often very unjust too. Cook, who has only to dress the dinner, and neither to work for it nor pay for it, turns up her nose at missis's 'meanness' and displeasure at waste or extravagance—cook, who, if any crash came, has only to look out for another place; while missis has her five children, whose little mouths must be filled, and little bodies must be clothed, and 'master,' whom it breaks her heart to see coming in from the City, haggard, tired, and cross—a crossness he cannot help, poor man!—or sitting down with a pitiful patience, sick and sad, almost wishing, save for her and the children, that he could lay his head on her shoulder and die! What does cook in the kitchen, fat and comfortable, know of all these things—of the agonised struggle for position and character—nay, mere bread—which makes the days and nights of thousands of the professional classes one long battle for life?

Also, the pretty housemaid, who has her regular work and periodical holiday, with her 'young man' coming faithfully on Sundays, about whom, should he turn out false, she rarely makes a fuss, but quickly takes up with another; she being essentially practical, and mental suffering being happily out of her line. Little she guesses of all the conflicts, torments, and endurance which fall to the lot of natures whom a different cultivation, if not a finer organisation, has rendered more alive to another sort of trouble—that anguish of spirit which is worse than any bodily pain. Little she knows, when she comes in singing to dust

the parlour, of many a cruel scene transacted there; or of many an hour of mortal agony, bitter as death, yet sharpened by the full consciousness of youth and life, spent in the pretty room, outside which she grumbles so, because 'miss will keep her door locked, and it'll be dinner-time afore ever a body can get the beds made!'

Servants should make allowance for these things, and many more which they neither know nor understand. They should respect, not out of blind subservience, but mere common sense, the great difference which their narrower education and mode of thought often places between them and 'the family,' in its pleasures, tastes, and necessities, and, above all, in its sufferings. This difference must exist: in the happy homes, cares and anxieties must be for ever arising like sea-waves, to be breasted or avoided, or dashed against and broken, as may be; and against these the servant must bear her part as well as the mistress. But it is, and ought to be, something to know how often a word or look of respectful sympathy, a quick little attention, an unofficial observance of one's comfort in trifles, will, in times of trouble, go direct to the mistress's heart, with a soothing influence of which the servant has not the slightest idea, and which is never afterwards forgotten. 'Better is a friend that is near than a brother afar off'; and better, many a time, is the silent kindness of some domestic who, from long familiarity, understands one's peculiarities, than the sympathy of many an outside friend who only rubs against one's angles, sharpened by sickness or pain, and often, unintentionally, hurts more by futile comforting than by total neglect.

A word on one branch of female service, undervalued the most important of all—the care and management of children.

I have always, from fond experience, held that child to be the happiest who never had a nursery-maid—only a mother. But this lot is too felicitous to fall to many, and perhaps, after all, would not be in reality so Utopian as in idea—particularly to the mother. So let us grant hired nurses to be a natural necessity of civilisation.

Poor things—they certainly need consideration, for they have much to bear. Children are charming in the abstract; but one sometimes sees the pretty cherubs of the drawing-room the little fiends of the nursery, exhibiting, almost before they can speak, passions which would tempt one to believe in original sin, did not education commence with existence. And whatever the mysterious law of sin may be that Adam made us liable for, it is possible to bring even babes under the dominion of that law of love—given by the Second Adam—to Whom little children come. And how? By practising it ourselves.

Ay; making allowance for the necessary shortcomings of all young things, just entered on the experience of life, from kittens to boys, the fault being much the least troublesome of the two, never once knew or heard of a case of irreformation. 'Naughty' children, in regard to whom parents, nurses, or both, were not originally and principally to blame. I never saw a fretful, sullen girl, who had not been made so by selfishness and ill-treatment the part of others, or by tantalising restrictions which compelled submission, hard enough at any time, especially in childhood; or a passionate, mischievous boy, who had not first had the Cain-like spark kindled into him by some taunting voice or unjust rebuke—not a baby-hand; teaching him that what he did he might do, and that the blow he meant to give was exactly the same sort of pain, and of the same spirit, as that he delighted to inflict on his brother, feeling out of his fierce little heart that this was the sole consolation left him for his half-sister's but intolerable wrongs.

Does ever any man or woman remember the feeling of being 'whipped'—as a child—the fierce anger, the insupportable ignominy, the longing for revenge, which blotted out all thought of contrition for the fault in rebellion against the punishment? With this recollection on their own parts, I can hardly suppose any parents venturing to inflict it—certainly not allowing its infliction by another under any circumstances whatever. A nurse-maid or domestic of any sort, once discovered to have lifted up her hand against a child, ought to meet instant severe rebuke, and, on a repetition of the offence, instant dismissal.

A firm will the nurse must have—which the child will obey, knowing it must be obeyed; but it should be with her no less than with the parents, a loving will always. I will not suppose any young woman so mean and cowardly as to wreak her whims and tempers, or those of her mistress, on the helpless little sinner, who, however annoying, is after all such a very small sinner. I cannot believe she will find it so very hard to love the said sinner, who clings about her helplessly night and day, in the total dependence that of itself produces love. And surely, remembering her own childhood and its events—such nothings now, of such vast moment then, its unjust punishments, unremedied wrongs, and harshly exacted sacrifices—things which in their results may have affected her temper for years, and even yet are forgotten—she will strive as much as possible to put herself in her nursing's place, to look at the world from his point of view, and never, as people often do, to expect from him a degree of perfection which one rarely finds even in a grown person; above all, never to expect from him anything that she does not practise herself.

It will be seen that I hold this law of kindness as the Alpha and Omega of education. I once asked one—in his own house a father in everything but the name, his authority unquestioned, his least word held in reverence, his smallest wish obeyed—'How did you ever manage to bring up these children?' He said: 'By love.'

That is the question. It is because people have so little love in them, so little purity and truth, self-control and self-denial, that they make such frightful errors in the bringing up of children. When I go from home to home of the middle classes, and see the sort of rule or misrule there, the countless evil influences, physical and spiritual, against which children have to struggle, I declare I often wonder that in the rising generation there are half-a-dozen good men and women. And when I glance down the Times column of 'Want Places,' and speculate how few of these 'nurses,' upper and under 'girls,' and 'nursery-maids,' have the smallest knowledge of their responsibility, or care about fulfilling it, my wonder is that the new generation should grow up to manhood and womanhood at all.

This responsibility—if the nurse ever reflects on it—how awful it is! To think that whatever the man may become, learned and great, worldly or wicked, he is at present only the child, courting her smile and coming to her for kisses, or hiding from her frown and sobbing on her neck, 'I will be good, I will be good!' That be she old or young, clever or ignorant, ugly or pretty, she has, next to the mother—sometimes before the mother, though that is a sad thing to see—this all-powerful influence over him, stronger than any he will afterwards allow or own. That it rests with herself how she uses it, whether wisely and tenderly, for the guidance and softening of his nature, or harshly and capriciously, after a fashion which may harden and brutalise him, and make him virtually disbelieve in love and goodness for the remainder of his existence.

Truly, in this hard world, which they must only too soon be thrust into, it is more essential even for boys than girls that, in the dawn of life, while women solely have the management of them, they should be accus-

tomed to this law of love—love paramount and never ceasing, clearly discernible in the midst of restraint, reproof, and even punishment—love that tries to be always as just as it is tender, and never exercises one of its rights for its own pleasure and good, but for the child's. To the nurse, unto whom it does not come by instinct, as it does to parents, the practice of it may be difficult—very difficult—but God forbid it should be impossible.

And what a reward there is in this, beyond any form of service—to a woman. Respect and gratitude of parents; consideration from all in the house; affection, fresh, full, and free, and sweet as only a child's love can be. Trying as the nurse-maid's life is, countless as are her vexations and pains, how many a childless wife or solitary old-maid has envied her, playing at romps for kisses, deafened with ever-sounding rills of delicious laughter all day, and lying down at night with a soft sleepy thing breathing at her side, or wakened of a morning with two little arms tight round her neck, smotheringly expressing a wealth of love that kingdoms could not buy.

And when she grows an old woman, if, as often happens to domestic servants, she does not marry, but remains in service all her life, it must be her own fault if nurse's position is not an exceedingly happy and honoured one. Not perhaps, in our modern times, after the fashion of her order in novels and plays—from *Juliet's* nurse downwards—but still abounding in comfort and respect. Most likely, she still lives in the family—anyhow, it will be strange if her grown-up 'children' do not now and then come and see her, to gossip over those old times which, the further we leave them behind, grow the more precious. In time these children's children—with their other parent, who knew not nurse, and whom nurse still views with rather suspicious curiosity—come and chatter to her, eager to hear all about 'pa' or 'ma'; how 'ma' looked when she was a little baby; whether 'pa' was a good boy or a naughty boy, some thirty odd years ago. And—a remarkable moral fact!—the chances are that 'pa' will gravely confess to the latter; while old nurse, seeing all things through the softening glass of time, will protest that neither he nor any of the children ever gave her the least trouble since they were born!

I have said a good deal, and yet it seems as if I had almost left the subject where I found it, it is so wide. Let me end it in words, which, coming into my mind now, transcend all mine, and yet, I trust, have been made the foundation of them, in which case I need not fear. Words, open alike to master and servant—studied by how few, yet in which lies the only law of life for all:

'Servants, obey in all things your masters according to the flesh; not with eye-service, as men-pleasers; but in singleness of heart, fearing God: And whatsoever ye do, do it heartily, as to the Lord, and not unto men; knowing that of the Lord ye shall receive the REWARD.'

BURLINGTON HOUSE—THE NEW HOME OF THE ROYAL SOCIETY.

IN 1780 the government allotted certain apartments in Somerset House for the use of the Royal Society. The architect, Sir William Chambers, had just completed his task; and the Society, entering into occupation of rooms with bare unplastered walls, fitted them up with suitable book-cases for their valuable library, and arranged the largest as a meeting-room. It was their sixth remove: twice the number which, according to the proverb, suffices for utter ruin. They, however, remained in occupation for seventy-six years, and flourished withal. Many a student, many a savant and philosopher, remembers with something like affection, that third door on the left, under the gateway leading from the Strand. It has opened to admit men

whose names stand foremost in the scientific annals of the present century. Heavy Sir Joseph Banks, carried in a chair by four strong men to preside at meetings of the Society; Davy, flushed with pride at having been elected to succeed the heavy baronet as president; Wollaston, among distinguished men perhaps the cleverest; and Herschel, Faraday, and many others living and dead. That memorable door no longer opens to science; she has migrated with her votaries a mile further away from the city.

Some persons have thought that the Society was too highly favoured by a grant of free quarters in the palatial edifice. But though the rooms were free, the windows were not, and window-tax was always exacted and paid. Moreover, the Society have always been the scientific advisers of the government: whenever an opinion has been asked, committees have been appointed, who spared no pains to make their reply worthy of the Society's reputation, and thereby of the nation's—drawing up reports or giving the very best advice gratuitously. At present, besides giving gratuitous opinions, the Society undertake the administration of £1000 voted by parliament every year for the promotion of science.

The impulse given of late towards improvements in the civil service, and an outcry for more room from the registrar-general, the Inland Revenue, and some other departments, set the authorities thinking that it would be desirable to take possession of all the rooms occupied by scientific societies in Somerset House, and convert them into offices. The Royal Society had long been straitened for room for their increasing library; hence, when my lords of the Treasury offered more spacious quarters in Burlington House, the offer was, after due consideration, accepted. Three other societies refused the offer, and are now 'sorry for it.' We have, however, heard a rumour that the house will be wanted some day for Prince Alfred: if it be true, the societies will have to undergo another removal.

We may here take the opportunity of correcting a misapprehension that prevails in some quarters—even in the House of Commons—as to the case of the scientific societies and the government. The Royal Society, from their origin in the reign of Charles II., have always been self-supporting: government has never done more for them than to find house-room, and that only since 1780. The Society have neither been fostered nor enfeebled by votes of money from the public purse for their own uses; they have always paid their way like honest savans, which is one of the reasons why the significant F.R.S. has become the first scientific distinction in the world. Of the annual grant of £1000, which was first voted seven years ago, when Lord John Russell was minister, not one penny has been applied by the Society to their own purposes. They act but as stewards of the sums, apportioning them in such ways as will best advance the ends of science—helping earnest inquirers whose circumstances are inadequate to the cost of experiments; at times, printing valuable observations, which, but for this aid, would have remained unpublished.

But to come to the subject expressed in the title of the present paper. If you have ever sauntered westward along Piccadilly, you will not have failed to notice a high sullen wall abutting on that pretentious lounge—Burlington Arcade. It is relieved by three gateways—two for show, one for use—which, up to within the past three years, were opened as seldom as a miser's strong box. But times have changed; the middle gate now stands open—that is, from ten to four on six days of the week—the three acres behind the wall, and the buildings thereupon, have become public property, and the public, taking advantage of the open gate, step in from time to time to see what has been bought with their money.

On entering, you see a spacious court-yard, not very well paved; at one end, a mansion built of stone, with two wings; at the other, a crescent-formed colonnade, cut in two by the main gateway. The principal front has a rustic basement, projecting ends, pilastered columns in the centre, all finished above by an entablature and balustrade. As for the wings, they are about as picturesque as bits of Gower Street would be planted on the same spot; and if you are perfectly sane on matters of art, you will not find cause for any very rapturous emotion, look to whatever side of the court-yard you may.

The east wing is occupied by the London University; the west wing—formerly the kitchen—has been converted into a hall of noble proportions, in which the Royal Society hold their evening meetings, and the university their examinations and annual gatherings, to confer degrees, and so forth. Government, too, have just had a fortnight's use of it, for examinations under the War Department. The main building is the new home of three scientific societies: the Royal and Linnean on the first floor, which comprises the state apartments; the Chemical on the ground-floor. The Linneans have also a room—for their museum—on the ground-floor; other parts of the building are tenanted by the assistant-secretaries. All the expense of removal, of furnishing and fitting up the rooms, and laying on gas, has been borne by the several societies; house-room and water only being given by the government.

The library and collections of the Linnean Society make a better show than in their late quarters, the gloomy old house in Soho Square. The shabby-looking books which belonged to Linnæus himself, and the ungraceful cases in which he kept his herbarium, are now preserved in a handsome glass-case in the Society's principal room—what was formerly the great ball-room—along with their library and some other collections. To the Linneans, the removal is a great benefit; for the heavy sum which they have hitherto had to pay as rent, will now become available for the printing of *Transactions*, and the promotion of their special science generally.

The same may be said of the Chemical Society; instead of paying rent, as they had to do in Cavendish Square, they will now have a fund to defray the cost of patient researches and astonishing experiments. They have fitted up their meeting-room with the seats from the Royal Society's meeting-room at Somerset House; and talking of these seats, we are reminded of a little matter of testimony in their history. On removing them from the place where they had been fixed for so many years, there was seen chalked on the floor underneath: *Billy Wilson, Richd. Sides, Silly Thos. Tool, and Robt. Thompson laid these seats in the year of our Lord 1780.* Henceforth, the three societies will meet on the same evening, Thursday, so that when business is concluded, they may all come together in the Royal Society's Lower Library for their cup of tea and friendly gossip, and so establish a series of *conversazioni* from November to June.

Besides the Lower Library above mentioned, the Royal Society have rearranged the chief portion of their library in six rooms on the first floor. You approach by a broad stair, in a well-lighted hall, of which the walls and ceiling are decorated by pictures from the pencil of Sebastian Ricci. In the paintings on the walls, the figures are life-size: a goddess, *Venus*, drawn in a car by wonderful swimming *Attendants* by gleesome maidens and flying *boys* on the side; on the other, *Diana* and her nymphs. The latter, which is painted with considerable *skill*, inspired a *mot* worthy of preservation. A *happening* to remark that he thought the *scene* loose, a learned professor who stood by, *admired* for his ready wit and mastery of science, *replied*

don't know about the canvas, but we see the subject is loose.'

The four front rooms occupied by the Royal Society are all built with coved ceilings, set off by mouldings and cornices richly carved and gilt. The saloon, the first room entered from the stair, is panelled in high relief, with carved figures over the door-heads, and shews on its ceiling a large picture, painted by Sir James Thornhill. The pictures on the other three ceilings are by Ricci, though whether Sebastian or his nephew Marco had the greater share in their execution is not easy to decide. It was Sebastian Ricci who painted the *Ascension* in the cupola of Chelsea Hospital, and the pictures on the staircase of Montague House—late the British Museum; and it is said of him that he left England in a pet because Sir James Thornhill was employed to paint the dome of St Paul's.

In the rear of the main building lies a large plot of ground enclosed by the walls of the Albany, Burlington Arcade, and of the street known as Burlington Gardens. A terrace, bordered by a double row of stately elms, stretches along three sides; the fourth is shut in by the very sombre back-front of the house itself. Broad grass-plots, divided by a gravelled walk, cover the area between the terraces; and what with the ample foliage of the trees, and the spread of verdure, the place is refreshing to the eye of a Londoner. The bachelors of the Albany wanted to enjoy it; and when government bought Burlington House, one or two of them knocked down the brick screens which shut out from their windows everything except a little daylight. But their enjoyment was cut short by a peremptory order from the Board of Works for the replacing of the envious screens within twenty-four hours. On the Burlington Arcade side, not a window, not a crevice permits curious folk to peep. Only from the street at the end can any view of the grounds be obtained by outsiders. Uxbridge House—now the Western Branch of the Bank of England—is one among those privileged to look down on the philosophers and savans as they saunter up and down under the shade of the trees. It is already classic ground hereabouts, and no detriment will accrue from the new associations. There, in the rear, lived Gay under Queensberry's ducal roof; Akenside resided in Old Burlington Street; there, in Cork Street, is the house which the old Earl of Burlington built for General Wade—a house of which some one said: 'It was too small to live in, and too big to hang to a watch-chain.' And had we space, we might record other reminiscences.

But now for a few words concerning the house itself. Pepys, the ever-memorable, says in his *Diary*, under date September 1668: 'To my Lord Burlington's house; the first time I ever was there, it being the house built by Sir J. Denham next to Clarendon House.' The Sir John Denham here alluded to holds a place among English poets as the author of *Cooper's Hill* and some other poems; he was surveyor of royal palaces and buildings; and it is supposed that he built the house for the earl, and not for himself. Be this as it may, it can hardly be true that the earl said 'he built on this spot, as no one would ever build beyond him; for other houses, noble and plebeian, were then actually built to the west, or in course of erection. However, Richard Boyle, the next Earl of Burlington, was an architect, who had, as Walpole says, 'every quality of a genius and artist except envy,' and he befriended architects, and aided liberally in the publication of architectural designs. He built a new front to the house mentioned by Pepys, in 1717, and in the following year the colonnade, gateway, and screen-wall. Walpole goes into raptures over this colonnade. The earl had invited him to a ball, and arriving at night, he saw nothing while crossing the court-yard; but 'at daybreak,' as he writes, 'looking out of the

windows to see the sun rise, I was surprised with the vision of the colonnade that fronted me. It seemed one of those edifices in fairy tales that are raised by genii in a night-time.' Walpole could hardly have slept off the effects of the ball, or else he wished to flatter his noble friend.

Sir William Chambers, again, remarking on the way in which the aristocracy of London hid their palaces behind dead-walls, as nuns and friars did their convents, says, referring to the wall of Burlington House: 'Few in this vast city suspect, I believe, that behind an old brick wall in Piccadilly, there is one of the finest pieces of architecture in Europe.'

And we find Gay repeating similar opinions. In a passage of his *Trivia*, he writes:

Burlington's fair palace still remains,
Beauty within—without proportion reigns;
Beneath his eye declining art revives,
The wall with animated pictures lives.
There Handel strikes the strings, the melting strain
Transports the soul, and thrills through every vein:
There oft I enter—but with cleaner shoes,
For Burlington's beloved by every Muse.

An unsophisticated spectator would come to a different conclusion, and lament that second-rate effects should have been produced on a site possessed of first-rate capabilities.

Gay's allusion to Handel arises from the fact of the great musician having lived three years in the house: it was, moreover, the residence of the Duke of Portland while he was minister; and the place is connected with political history by yet another incident—Sir Samuel Romilly once addressed the electors of Westminster in the court-yard.

One of Hogarth's prints, the *Man of Taste*, contains a view of Burlington House, concerning which Mr Peter Cunningham remarks, that 'it represents Kent (the architect) on the summit in his threefold capacity of painter, sculptor, and architect, flourishing his pallet and pencils over the heads of his astonished supporters, Michael Angelo and Raphael. On a scaffold, a little lower down, Pope stands, whitewashing the front; and while he makes the pilasters of the gateway clean, his wet brush bespatters the Duke of Chandos, who is passing by; Lord Burlington serves the poet in the capacity of a labourer; and the date of the print is 1731.'

That same 'old brick wall' has borne many a shot of late from paper artillery and from parliamentary artillery too. Sundry energetic individuals have demanded its demolition in the *Times*, to say nothing of other papers; and not longer ago than the 19th of June last, certain members of the House of Commons talked 'Bunkum' with like purport. The wall ought to come down, and forthwith! If it did come down, we venture to say that nobody would be gratified, not even the members aforesaid; for the scene to be revealed would be an uninteresting view of the back of the colonnade, of an old coach-house and stables, of the hinder appurtenances of the porter's lodge, and of some other places resorted to by students when up for their examination.

The earl died, and the title with him, in 1735, and Burlington House became the property of the Duke of Devonshire. There was talk of pulling it down about fifty years ago; but Lord George Cavendish bought it, and made considerable alterations, employing Samuel Ware as architect. He 'took down,' says Britton, 'and rebuilt the whole house, except the front elevation and some rooms connected with it.' He restored the terraces and steps in the grounds behind, and converted the east wing, which had been a riding-house and stables, into a dwelling for a portion of the household. In 1819, he built Burlington Arcade, and got a rental of £4000 a year for that double row of

badly ventilated shops. This amount, as we have heard, is increased by sub-letting to L.8000. Among the tenants there is one who pays L.176 a year, and another L.195 each for his one little shop.

One thing Lord George did not do—build wholesome habitations for his servants; for anything more dismal than the underground apartments cannot well be imagined. That any domestics should ever have consented to pass their days therein, is a marvel; but now there is a change. The Board of Works, by a small outlay, have turned the dungeons into habitable rooms.

The Cavendish family retained possession till about three years ago, when they sold the Burlington House estate to government for L.140,000. The house stood empty for a few months; then an exhibition of drawings and paintings, and another of designs for cavalry-barracks were held in it; then, to make room for the registrar-general, the university was transferred from Somerset House to Burlington House. In 1856, the Royal Society, as already stated, accepted the offer of a home further west; preparations for their reception were commenced; the university was shifted once more into the east wing; and in May of this year the Royals held their first meeting in the new hall; and there we leave them in occupation of their new home, with our best wishes for harmonious action with their fellow-lodgers, and that they may continue to advance science, and advocate her claims as worthily and as independently as heretofore.

It was during the long vacation of 1856, while repairs were going on, and before the societies entered into occupation, that an incident occurred, with which it seems to us good to close our article on Burlington House. The reader must be good enough to imagine a certain porter who was on duty at the time, giving an account of it to a certain professor.

'Sir,' says the porter, 'there came in a briek-looking oldish gentleman, with a sprig in his mouth; and seeing him look about, I made bold to go up to him and ask his name.

"My name is Lord Palmerston. Who are you?"

"The porter of the —, my lord;" and I made his lordship a bow.

"The very man I want to see. Come and shew me over the house."

"So," continues the porter to the professor, "I went, sir, as his lordship asked, and shewed him the house, and told him which rooms was for the Royal Society, which for the Linnean Society, and which for the Chemical Society. And his lordship asked a good many questions, and seemed to want to know all about the societies, and I answered him as well as I was able. And so, after we had been all over the house, his lordship wanted to go out into the grounds behind, and I unlocked the door, and his lordship walked about and asked more questions; and then he talked about the societies again, and he said: "What is the Linnean Society? What do they do?"

"And his lordship didn't know, sir, nor I didn't know!"

VERY LIKE A WHALE.

ONE of the greatest luxuries we possess in these luxurious days, is the power of enjoying the startling novelty, exciting adventure, and magnificent scenery of foreign climes, without stirring from the comfortable arm-chair in our library, or, at all events, without greater exertion than is necessary to obtain possession of the well-padded stall of some exhibition-room in Piccadilly or Leicester Square. In this way, with the assistance of Mr Burford, we witnessed the capture of the Malakoff, and were present at the Moscow coronation. In this way, we have ascended Mont Blanc with the facetious Albert Smith, and slain lions and hippopotami in company with the adventurous Gordon Cumming. With Dr Livingstone, we

have explored the interior of Africa; and, disguised as true and mahogany-coloured followers of the Prophet, we have penetrated with Captain Burton to Mecca and Medina. Through the instrumentality of the Abbe Huc, we have made the acquaintance of those ridiculous Chinese; we have got very near the North Pole with Dr Armstrong; we have journeyed round the world with Madame Pfeiffer—in fact, there is not a spot on the face of the globe that has been described by book, lecture, or panorama, that we have not visited, and do not know almost as much about as the authors, lecturers, and artists themselves.

In the course of these sedentary wanderings, there are certain favourite scenes and incidents that we have seen with our mind's eye on so many occasions, that they have become as familiar to us as if we had actually witnessed them. They appear to be standard subjects that age cannot wither, and whose infinite variety custom cannot stale. For instance, how often, as we have been sitting before our fire with our legs up on a chair, have we felt awestruck and insignificant as we gazed upon the glories of Niagara. How many times on a cold December night, with the curtains comfortably drawn, and the kettle singing cheerily on the hob, have we, panting with heat and blinded by the glare of the desert sun, been assisted by semi-nude Arabs up the steps of the Great Pyramid, and drank imaginary bottled beer when we got to the top; and, to come to the subject more particularly in hand, how often, as we indolently lounged in our dressing-gown and slippers, on our favourite sofa, have we thoroughly enjoyed all the dangers and excitements of whale-fishing.

It is related of Colonel W——, the historian of British India, that when he was told that the author of *Lalla Rookh* had never been in the East, he said: 'Well, that shews me that reading D'Herbelot is as good as riding on a camel.' On the same principle, there are few readers who, by studying Herman Melville's volumes, and other works of the same oleaginous nature, are not as well acquainted with the *modus operandi* of capturing a whale, from the cry of 'There she spouts!' of the man in the cross-tree, to the stripping off the blubber at the ship's side, and boiling it down in the ship's coppers, as if they had spent the greater part of their lives cruising about the Arctic Ocean with harpoons in their hands. Supposing the reader, therefore, to be theoretically a first-rate whale-fisher, I shall not waste time and paper by dilating on the perils of icebergs, of boats set fire to by the friction of the rope, or stove in by the monster's tail, or any other of the moving accidents and hair-breadth 'escapes incidental to this most exciting of pursuits, but shall come at once to what I consider its antithesis—namely, duck-hunting.

No reader of this Journal, it is to be hoped, has ever been present at a duck-hunt. It is a barbarous exhibition, although not a bit more cruel than fox-hunting, or any other sport in which a poor defenceless animal struggles gallantly for its life, till from sheer exhaustion it falls an easy victim to its relentless persecutors. The only difference between them is, that the fox has the honour of being chased to death by well-bred hounds with sleek dappled coats, and well-mounted gentlemen in red ones, while the instrument of the duck's destruction are generally ragged dogs and a scrubby terrier. The first, therefore, is a stately and noble sport, belauded by poets and followed by all the high and mighty in the land; and the latter is, equally as a matter of course, a low and disgusting pursuit, for which the young rascals engaged in it ought to be well whipped, and their ears boxed.

The essentials for duck-hunting are—a good old pond, a tough old maltard, an accomplished dog, and boys ad libitum. If the duck is clumsy enough to dive when the dog makes a snap at him, he is caught;

if not, he is caught. Generally, though for a few minutes he may avoid the terrier, his sojourns under water get short by degrees and ominously less, till at last he falls a victim to what may be literally called the dogged determination of his canine pursuer. There is but one chance in his favour, namely, the apparition of that modern *rara avis in terra*, a policeman, or of some individual with humane feelings and a thick stick. Occasionally, also, a duck owes his life to his own powers of endurance, shewing such good sport, that, like the hunted stag, he is saved for another time.

As a sport, duck-hunting in many points bears a strong resemblance to coursing. In each, the dogs hunt by sight, the human—or, as some would say, the inhuman—owners being only spectators, assisting their animals in the one case by finding the game; in the other, by preventing its escape by flight from the pond. The conduct of the hare and the duck under pursuit are also very similar. The hare lies like a stone till she is almost kicked up; and the duck does not dive till the nose of the terrier almost touches his tail. The instinct of self-preservation teaches both to place themselves under circumstances most favourable to their peculiar conformation: the hare takes to the hills, where her long hind-legs give her a better chance of escape; and the duck dives under water, where, for a certain time, he is perfectly in his element, and safe from pursuit. The astonishment of the great bounding greyhound when he finds himself unable to pull up, and going several yards beyond the point where the hare has doubled, is only equalled by the puzzled look of the terrier when the duck disappears from out of his very jaws, and he gazes helplessly round in doubt as to where his prey will make its reappearance. To finish the parallel—both hare and duck eventually arrive at the same destination, each being only rescued from the jaws of the dog, that he may, at a later period, find employment for the jaws of his master.

The analogy between duck-hunting and whale-fishing is, however, even more striking. The same mode of escape—the same necessity for occasional respiration on the part of the victim—the same exciting uncertainty as to where the next appearance will be, form the characteristics of each pursuit. In fact, as popping at sparrows and slaughtering elephants may be considered as the two extremes of terra-firma shooting, so hunting a duck and chasing a whale may be termed the alpha and omega of aquatic sport. There is an amusement, however, common on the Lake of Geneva, called *la chasse du grêbe*, that partakes of the qualities of each, and forms a connecting-link between them: it is the comparative, of which they are the positive and superlative. I shall therefore conclude this paper with a short account of grebe-shooting, which was indeed the principal object with which I commenced it: its having degenerated into a dissertation on duck-hunting was purely accidental; and accidents, as every one knows, will happen in the best regulated articles.

The grebe is a handsome swimming bird with a fine crest, that gives him the appearance of having had his own head cut off, and one belonging to a much larger individual substituted. He seldom flies, and his pedestrian powers are so inconsiderable as to be hardly worth mentioning, negative qualities in which he resembles the duck, and which render him peculiarly applicable for the sport I am about to describe. He is not prized for his flesh, which is coarse and fishy, but, like the whale, he contributes in another way to the wants of man, or rather woman, as his skin, which fetches from six to ten francs, is made into muffs, tip-pats, and other articles of feminine attire. No particular day is mentioned in the Swiss almanacs as that on which 'grebe-shooting commences;' but autumn is

the season when the largest bags are made. Four is the golden number for the shooting-party, from which no deviation must be allowed; and to give some sort of *vraisemblance* to our description, let us suppose the expedition planned, and the party to consist of those well-known continental travellers, Smith, Brown, Jones, and Robinson. They have been stopping at Lausanne, and, with the love of sport inherent in Englishmen, determine to have a day's grebe-shooting. In pursuance of this laudable resolution, they hire a boat for the day; and in illustration of another pleasing trait in the English character, lay in a stock of provisions sufficient to last them a week.

Everything being ready, they shove off with a full determination of bringing back a large bag of grebes. They could not have a better day. The lake is without a ripple; the sky as blue as London milk; and the air as clear as Thames water, after it has been filtered. The southerly wind and cloudy sky so prized by fox-hunters, would prove totally destructive to the hopes of the grebe-shooter. A frost could not be more annoying to the former, than any mist or thickness of the atmosphere to the latter. By the direction of the rowers, who are accustomed to the sport, our heroes—each, as a matter of course, with a cigar in his mouth—distribute themselves *en règle* thus: Robinson, being rather stout, establishes himself in the stern; Jones occupies the bow; and Smith and Brown take their stations on the quarters; so that on whichever side the unfortunate bird may appear, he will be sure to hear a shower of No. 1 shot pattering round him. The necessity of first catching your hare is enforced by the sagacious Mrs Glasse, as an essential preliminary to cooking him; and in the same way, 'first find your grebe' is a rule that must invariably be observed previous to shooting him. For this purpose, the surface of the lake is eagerly scanned in all directions, through pocket-telescopes and double-barrelled opera-glasses. Brown is the first to catch sight of game; and Robinson, after staring intently for some minutes through his ivory *lorgnette*, confirms the discovery. The boatmen are directed to row in the direction of the supposed grebe.

'What a magnificent fellow!' exclaims Robinson, whose face glows like a peony with heat and excitement. 'He's as black as a coal.'

'But he dothn't seem to move,' says Smith, who lips and drops his r's. 'I thought gebes dived.'

'He'll dive fast enough presently,' replies Robinson, who is standing up in the stern with his gun ready, although the quarry is a mile off.

'I say, mind how you shoot,' says Jones, in the bow, as he looks nervously round at his friends' guns, which are pointing so, that were they to go off, Robinson's would deposit a charge in the small of his back, and Smith's and Brown's shave off his whiskers. 'Keep your muzzles up, can't you?'

'Do you know,' said Smith, looking intently through his glass—'I don't think it's a gebe, after all. It hathn't got any head.'

'It's asleep, perhaps,' replied Robinson, getting ready for a sitting shot.

'Why, it's an old hat!' cried Jones in disgust, when they had got near enough to a black object floating motionless in the water, to distinguish its real nature.

Brown, the original discoverer of the hat, is of course well abused for having led them such a wild-geese chase; and the quartette, to make up for their disappointment, have recourse to that potent consolation to the youthful Briton, pale ale. Presently a real Simon Pure is sighted, with his brown coat and white under-garments shining in the sun like satin, and a bright chestnut-coloured crest hanging down his neck like the back-hair of a lady with auburn locks when it is undergoing the operation of being brushed. This time the sportsmen place themselves under the

direction of the head-boatman, whose advice, in the excitement of the hat-chase, they had previously scorned. Silence is enjoined, and an agreement entered into between the shooters that, for fear of accidents, only one shot shall be fired at a time, and that one is to be by the individual nearest the bird. This rule is, of course, broken on the very first opportunity, when all four blaze away at the game, in utter recklessness of consequences. This does not happen, however, for some time. At first, on being approached, the grebe is wild, and dives a long way out of distance. The boatmen, judging from the direction he takes, row to the spot where they expect he will reappear. He is too cunning for them, however, and comes to the surface some hundred yards from where they had calculated to see him. Away they go in pursuit; but long before the eager gunners can get within shot, down goes his head, up goes his tail, and away he paddles on his subaqueous expedition, to come up again to breathe in a more unexpected quarter than ever. Perseverance is at length rewarded, and the rowers make a lucky cast. The grebe ascends within twenty yards of the boat, but finding his mistake, hey, presto! he is down again like lightning; and the only result, caused by the contents of four barrels fired recklessly in his direction, is a very near approach to the capsize of the boat, and a few bubbles floating on the surface of the water. Unfortunately for the poor bird, his respiratory organs are so constituted that an occasional mouthful of fresh air is one of the necessities of his existence, and his late summary proceeding obliges him to expose himself again before he can get out of range. A severe peppering is the consequence; but he is still so active, that a white tail in the act of disappearing is the only mark he presents to the random shots of the excited sportsmen. The contest, however, is too unequal to last. Tired and wounded, the grebe's attempts to escape become more and more feeble, till, after repeated volleys, a lucky shot administers the *coup de grâce*, and the party in the boat sit down to luncheon.

Having seen them bag one bird, it is not necessary to follow them any further on their aquatic expedition. Their subsequent achievements may be briefly expressed by the musical term *da capo*, a phrase which I have been given to understand is synonymous with the English one of 'ditto repeated.'

My object is gained if I have made good my title, and proved to everybody's satisfaction, that the Lake of Geneva and the Arctic Ocean are in some respects similar; and that the grebe—to say nothing of the duck—is, as far as the manner of his capture is concerned, extremely like a whale.

RELIGIOUS OBSERVANCES IN ITALY.

SOME impressions of a winter I spent on the shores of the Adriatic have been already offered to the readers of this *Journal*. Nor would any further delineations of an Italian interior have suggested themselves to my mind, had not the great events of the present moment given a fresh interest to the countries most likely eventually to be affected by them, and awakened a desire to learn, more thoroughly, what is their actual condition, and determine how far Central and Southern Italy, retaining their former mode of government and institutions, can challenge a comparison with that northern state of the peninsula where progress and reform are the order of the day.

It is the prevailing impression on the continent that no part of Europe will be sooner subjected to some violent convulsion and up-rooting of all existing things than the kingdom of Naples and the papal dominions. To the reader of Italian journals, the attentive listener in Italian political circles, the evidence is unmistakable that the tide of popular feeling is setting in anew in

favour of a constitutional government; and the hope of rationally and peacefully realising the dream of 1848, of a united Italy, with Piedmont as its head, is daily gaining ground. Even among conscientious Catholics, the project of a speedy separation of the temporal from the spiritual authority of the pope, is openly discussed, and by many considered as their only safeguard from the torrent of anarchy and revolt to which the oppressions and corruptions of its rulers are hastening the country.

But of these questions, in their wide political bearings, abler pens are treating; my task is simply to complete the picture of the customs, the amusements, the domestic life, the religious ceremonies, the environs of one city in the Roman States, which I have enjoyed better opportunities of studying than are generally accorded to an English traveller; and from which, depicted with the most conscientious veracity, the unprejudiced reader can form his own deductions.

Though the austerities of Lent have ceased to be observed, even in the faithful diocese of Ancona, to any very mortifying extent, the ancient rites of the church are still kept up, and towards the close of the Holy Week, the whole population becomes compulsorily devout. The parochial clergy go round to every house in their jurisdiction, taking down the names and ages of the inhabitants, and delivering to all a ticket filled up with their name, requiring them to repair, within a given period, to the parish church, for confession and communion. Any freewill-offering, any spontaneous act of grace in these religious duties, is thus lost; and with the young men especially, *prende Pasqua*, as it is termed, becomes a most irksome task, which they endeavour to shuffle over, or resort to every expedient and deception to evade altogether. The government, however, is very strict in enforcing this ordinance, with the political view of maintaining its fast-waning influence through the confessional, going even the length of refusing pontifical subjects their passports, if they require to travel, when it can be proved that they have neglected their Easter duties; but this is an odious abuse of authority, tending to bring religion into contempt.

I remember hearing of the astonishment and indignation of some members of the V— family—Poles by birth, but French by education—with whom we were intimate, the first year they passed in Ancona, when the priest, having taken the statistics of the household, and ascertained that they professed the Roman Catholic faith, handed to each of them in succession a printed ticket, requiring them to conform to this law. In France, they declared, they had never heard of such a measure; and they could not, even before us, resist from expressing their disgust. It required all their mother's persuasions, and the example of her unquestioning submission to whatever emanated from papal authority, to stifle the murmurs of the young ladies, and enforce their obedience.

On Holy Thursday, after mid-day, an unusual silence seemed to fall upon the town, unbroken till the same hour on Saturday. No bells were tolling, no matins or vespers rung, no mass celebrated in the churches; while the streets were filled with people hastening to the *sepolcri*, or sepulchres, of which every one must be visited by the faithful. Each church has its *sepolcro*, varying in the details, but agreeing as to the general characteristics of the representation. The altar is divested of its usual ornaments, is in mourning; and on the platform immediately before it, surrounded by all the emblems of the passion, is a figure in wax of life-size of the Saviour, as if removed from the cross. All around, and on the steps leading up, are a profusion of natural flowers, tapers; and sentinels with arms reversed are stationed at intervals to keep back the crowd.

In some churches more figures are introduced.

as Joseph of Arimathea, the beloved apostle, the three Marys; others have a greater display of flowers and wax-lights, but the pervading effect in all is invariably the same. The complete stillness; the ceaseless, voiceless swaying of the crowd, as those who occupy the foremost places, after a few minutes' admiring inspection, and a few muttered prayers, quietly give room in their turn to fresh comers; the indiscriminate blending of rich and poor, as the lady in her silken robes kneels on the pavement beside the tattered beggar; the motionless forms of the Austrian soldiers in all the glittering panoply of war, surrounding the barred and blood-stained effigy of the Prince of Peace; the saturnine matter-of-fact faces of the attendant priests and sacristans, who hover about, relighting any taper that is accidentally extinguished, or adjusting any of the arrangements that may be displaced; the air heavy with the scent of flowers mingling with the exhalations of the vaults beneath, where moulder the remains of those who in their day have gazed upon his spectacle, for centuries repeated, for centuries unchanged: all this has struck each stranger in his turn, and is but a feeble transcript of the varied impressions it produces.

On Good Friday, there is always a procession through the principal streets of the town, which, without any of the devotional accessories of the sepulchre—the time-worn churches, the subdued light, the hushed voices—cannot fail painfully to impress the English spectator who has not been inured to sights of this description.

By the people it was eagerly looked forward to as a pleasant variety in the monotony of their lives, an opportunity of sauntering about, of looking out of the windows, of nodding to their acquaintances, and of witnessing some flirtation or intrigue. Any idea of investing the pageant with a religious significance seemed foreign to the minds of the great majority of the assembled throng.

When the muffled drums were heard announcing that the procession was approaching, and a detachment of troops began to line the street under our windows, I marked a thrill of excitement, but certainly not of awe, as every head was impatiently turned in the direction from whence the torches and banners of the confraternity of the *Passionisti* first came in view. Men of all classes belonged to this *compagnia*, all similarly dressed in loose robes and cowls of gray linen, which concealed the features, a crown of thorns round the head, and a girdle of knotted cords; the difference of rank being discernible only by the whiter feet of some amongst them, and the evident pain with which they trod the sharp uneven pavement. I must, however, pause to observe here, that a bent head and hoarse air would be the general accompaniments to these marks of gentle birth, were the drapery in which they were enshrouded to be suddenly thrown aside.

Next came friars and priests, all walking according to established rule and precedence—Capuchins, Franciscans, Carmelites, Dominicans, Augustinians, carrying ghastly tapers and chanting litanies. Following these were more Capuchins, to whom was especially delegated the office of carrying all the objects belonging to the crucifixion; and thus they passed on, white-headed tottering old men, bearing successively an emblem of this day's great sacrifice, profaned by being treated, like some mummery of old, before the idle crowd, who gazed, and sneered, and talked, indifferent to the awful event thus commemorated. The crown of thorns, the purple robe, the scourge, the nails, the cross with which the soldiers had cast lots, the spear, were all carried slowly along; the sacred form itself, the utter prostration of death, stretched upon a bier, coming next in view. A few knelt here, not one in twenty though; the rest all listless, unthinking, or unbelieving.

Some paces behind, upon a sort of platform, appeared a huge image of the Madonna, considerably above the size of life, dressed in violet robes, with long brown ringlets, and pierced through with seven daggers—all the spiritualised beauty with which the 'blessed among women' should be invested, lost in the vulgarity of this most material representation. This, with the dignitaries and magistrates of the town walking two and two, closed the procession; after which marched more soldiers, those who had been stationed along the streets falling into the ranks, and the band performing a funeral-march—the same the Austrians always play after the interment of any of their comrades.

I have not exaggerated this description. To some enthusiastic poetic minds, to whom such things seem beautiful in the abstract, I know my account will prove distasteful. But thus it always is: a close insight into the countries where these time-honoured traditional ceremonies are still maintained, strips them of the mysterious charm with which, to a foreigner, they might seem to be invested, and accounts for the levity with which they are witnessed by those familiarised to them since their earliest childhood.

As another instance: there was the custom of blessing the houses on Easter Saturday, which I had heard of long before visiting Italy, and imagined must prove equally edifying and impressive. But when I saw a very dirty priest in his *alb*—I think that is the name—a sort of linen ephod worn over the black gown, attended by a still more dirty little boy carrying holy-water, walk hastily through the house, muttering a few unintelligible words on the threshold of each room, only pausing a little longer in the kitchen to crack a few jokes with the servants, without the least semblance of devotion on his side or of reverence on theirs—and gratefully accepting a few *pauls* sent out to him by the family—why, I fell from the clouds, and my cherished illusions were dispelled. It seemed almost as hollow as blessing the horses on the 17th of January, the festival of St Anthony, the patron of animals, which had previously greatly astonished me.

All the post and *vetturino* horses, all those belonging to private families, were taken on that day, gaily decked out with ribbons, to a square in front of one of the principal churches, where priests, standing on the steps of the portico, sprinkled them with holy-water, and pronounced a formula of benediction. A small gratuity was given for each horse, and in return the donors were presented with a little wax-taper and a small loaf of bread, by which the grooms, rather than the poor quadrupeds, were the gainers. There was a favourite cat in my uncle's establishment—a cat of great size and beauty, and of doglike sagacity—which the servants were in vain desirous he would send to be blessed, though prompted by no other motive than the pleasure of dressing it up, and of joining in the crowd of idlers before the church.

Generally, however, it would appear as if some vague idea of averting ill-luck, of deprecating some sinister influence, must linger in the hearts of the coachmen and postilions who still adhere to this custom; which is practised by the priests—so Young Italy will tell you—solely to maintain their hold upon the superstitious fears of the lowest ranks of the populace.

But stay—I am wandering from my more immediate subject, although all the church-bells let loose, and ringing their merry peals, proclaim it is noon on Holy Saturday, and that Lent is over! There is something very heart-stirring in this rejoicing: I wish we had the same custom in England to usher in the triumphant glories of the Easter morn. Why it should be anticipated here by twelve hours, and the bells give forth their jubilee, and salvos of artillery be fired, at mid-day, instead of mid-night, I do not exactly know: I think I have somewhere read an

explanation of this usage, of which I retain no clear remembrance, save that it is of very remote antiquity. Be this as it may, a few hours sooner or later are of little import; it is the pleasing impression on which I dwell, and it is one of the customs that, even with my hard matter-of-fact notions about the 'good old times,' I should gladly see revived amongst us.

On Easter Sunday, every one who has scraped the wherewithal together, puts on new clothes, and dines on roast lamb; baskets of stained eggs are sent about as presents, and children feast on cakes embellished with the figure of the Paschal Lamb. In the week following, many marriages take place, as, except under particular circumstances, weddings are never solemnised in Lent.

Dinner-parties are also frequently given at this season amongst intimate friends; more formal ones sometimes on Easter Monday or Tuesday, by the principal families, to some great personage, the delegate or the bishop, for instance. But throughout all, whether on a social or more ceremonious footing, the same kindly feeling, the same absence of ostentation, invariably prevail. Would that we resembled the Italians in this respect! They literally follow the evangelical precept of asking to their banquets those by whom they cannot be bidden in return. At every dinner-party there are always to be met three or four old gentlemen, friends of the family, neither useful nor ornamental accessories, not distinguished by sprightliness, riches, or good looks. They would be classed as insufferable bores by us, and if asked at all, only grudgingly, to fill up a vacant place; but here, on the contrary, their age and infirmities constitute their title to admission; and unfailingly, whenever a *trattamento* is given—as any gathering for the purpose of making good cheer is denominated—are these old friends seen in their accustomed seats at the table, not the least tinge of patronage being mingled with the cordiality of their reception.

The celebration of the festivals of the Madonna, to whom the month of May is especially consecrated, and of San Ciriaco, the patron saint of Ancona, followed quickly upon those I have been just now describing; and a concourse of peasants, daily flocking in, by their bright-looking costumes, and picturesque handsome appearance, enlivened the town to a very unusual extent.

Indeed, the weather was so lovely, the air so balmy, the atmosphere so gauze-like and softening to the objects it surrounded, that an irresistible charm seemed resting upon the land; and it became easy to comprehend how a colony of Dorians, establishing themselves upon its shores, crowned its lofty promontory with a temple where Venus was invoked.

A cathedral, dedicated to San Ciriaco, one of the oldest in Europe, now occupies the site of the heathen shrine, nobly situated on the very summit of the hill, overlooking the town, which rises for some distance along its sides, but terminating about half-way, leaves the *duomo* undisturbed in its hoary majesty and impressive solitude. We used to delight in walking up here, and sitting on the steps of the portico, of which the columns were supported on two colossal lions of red granite, gaze forth on the grand prospect which this position displays. At our feet, sloping downwards in a semicircle, lay the town, the mole with Trajan's celebrated arch, the harbour and shipping, commanded by the citadel, and background of mountains stretching far along the curve of the coast, with higher ranges more dimly seen, forming part of the great chain of Apennines by which Italy is intersected. Turning away from this, you seem transported to a different region, for on three sides of this bold headland, a broad expanse of waters alone meets the view. The walls of the cathedral are not six paces removed from where the cliff abruptly ends, presenting a rugged face

of rock, which towers some two or three hundred feet perpendicularly above the sea. The wild music of the waves, on a stormy day, as they surge against its base, is borne upward by the wind, and distinguishable amid the strains of the organ and the voices of the choir, produce an effect not easily forgotten. Unfortunately, the existence of this venerable pile is threatened by the inroads of the sea, which slowly, but perceptibly, is undermining the cliff; and in a hundred years, it is calculated, the *duomo* will be in ruins. The votaries of San Ciriaco say, however, that he will not fail to protect his church, and defy the ravages of the elements.

The body of the saint, clad in his episcopal robes, for he was bishop of Ancona, is preserved in a subterranean chapel, and is annually exposed, for the first eight days of the month of May, to the veneration of the people.

The legend runs, that after undergoing in the east the martyrdom of boiling lead being poured down his throat, his remains floated in a stone coffin back to the scene of his former labours.

In the *duomo* is also kept the famous picture of the Madonna, attested to have opened her eyes in 1736, at a moment of great peril to the state, which was overrun by the armies of the French Republic. Fifty years after, in 1845, this miracle received the confirmation of the papal authority; and the petitions from the *gonfaloniere* (mayor) and magistrates, the clergy and the nobility, imploring that, 'as an acknowledgment of being thus privileged, they might be permitted to place Ancona under the immediate protection of the Madonna, who, by opening the eyes of her venerated image, had signally shewn her favour towards it'—received a gracious response. Fireworks, processions, a general illumination, and nine days of religious ceremonies at the *duomo*, inaugurated this event, which at every succeeding anniversary is still commemorated with great solemnity.

It was my good-fortune to hear a course of sermons delivered in honour of the holy image by a Barnabite friar, Padre G—— of Bologna, one of the most celebrated preachers of the day; and the scene presented by the illuminated church, the enthroned picture—meek and lowly face, shaded by a dark-blue mantle, but resplendent with a star and rose of brilliant, white which it had been adorned by Pius VII.—the eagle upturned countenances of the crowd, as their kindling glances wandered from the impassioned orator to the half-closed eyes of the motionless effigy he was apostrophising, as if seeking to discern some miraculous manifestation in their favour; the enthusiastic approval the fervent action of the priest as his lofty form towered in the pulpit, and his powerful voice swelled like an organ through the aisles—all rise vividly before me, resembling some dream of enchantment, with that strange fascination that such pageants in Italy possess.

Not less remarkable than his startling eloquence was the ingenuity with which the preacher directed nine consecutive days of discourses upon the same topic. One day he surprised his auditors by allusion to the invention of gunpowder, the destructive missiles employed in modern warfare, the disastrous sieges and the fearful loss of life, all attributable to this discovery. Then depicting the horrors of three well-known bombardments and picturing the thrilling power, he asked triumphantly whence that Ancona, often surrounded by hostile armies, invested by foes as watchful as relocations, had been preserved from a similar fate? Was it not by the miraculous presence of that heavenly image, whose modest eyelids had been raised, in answer to the greatest peril to the church, to give succour to the dejected, and faith to the wavering?

On another occasion, he commenced

description of the early youth, the education, the first exploits of Napoleon. He led you on step by step in his career; he successively brought him before you as the sullen sensitive boy at Brienne, the aspiring lieutenant of artillery, the young general of twenty-six, making Italy ring with his fame. On he went, gathering fresh ardour, more striking similes, more startling ebullience, as he dwelt on the resistless might which hurled down thrones and swept away kingdoms in a reath, till he brought him, flushed with conquest, to Ancona. 'And here,' he continued—'here, beneath his venerable dome, standing before the sacred picture, prepared to scoff and ridicule its divine powers—that man, with eagle eyes and folded arms, gives one hurried glance, and trembles. . . . Yes! The haughty row which the fabled thunders of Jove might have scintilled, is bent before that benign though reproachful gaze. His sallow cheek grows ashy pale as thoseavenly orbs unclothe upon him! His limbs totter; the sacrilegious hand which was stretched forth to hold on the venerated image is withdrawn, and he hastens away, sternly forbidding its removal or inspection!'

As a last specimen of this attractive, but certainly secular style of pulpit oratory, I ought to quote from magnificent delineation, with which he opened another of his discourses, of the terror that marks the progress of the Destroying Angel, scattering pestilence from its sable wings, with desolation and mourning in his wake. But my limits forbid anything beyond a mere tetch of the subjects on which he enlarged, with a graphic power, a scenic effect—if I may use the term—which it is impossible to convey any just conception. He dread judgment on the first-born of Egypt, the plagues sent on the murmuring Israelites—the dire torments of the dark ages, when cities were made desolate, all whole populations swept away by similar awful visitations—all were detailed with harrowing power. Passing on from these to modern times, he addressed himself more particularly to the feelings of his auditors, recalling the ravages which the cholera had made in a few years previous in Ancona, when, out of its population of 25,000, 1000 were swept away; and finally bade them ascribe their own preservation—the final disappearance of the scourge—to the wondrous cure having been borne, amid the tears and supplications of the inhabitants, in solemn procession through the streets. 'Give me, O Maria! he here cried with transport, striking himself upon the breast—'give me a wing-tide of roses and hyacinths to weave in garlands for thy shrine; give me the laurel-wreath of genius, the monarch's crown of gems; give me all that earth holds beautiful or rare, to cast in tribute at thy feet. Give me eloquence to inspire, fervour to incite, persuasion to reclaim—give all to me, who yet am nothing, but consecrated to thy service. Let me gaze on those vestal eyes, which so benignly opened upon Ancona, and gather there undying ardour and unconquerable love, our only hope, our only refuge!'

After an address of this description, an approving murmur used to be discernible among the crowd, while he and then an irrepressible 'bravo,' or a patronising 'well, bene,' would be heard. But apart from the monks—who, as I have said, flocked in large numbers to these ceremonies—and the poor old women, whose thithered lips and palsied fingers were ever busy in giving their rosary and counting its beads, I should be sorry to have to estimate how much real devotion felt in the hearts of the multitude which daily congregated at the duomo, as soon, at least, as the excitement which such fiery appeals would naturally reduce upon the susceptible temperaments of the north, had worn away.

As for the young men, of whom there were numbers every present, I heard from various sources that they had no more thought of anything religious in what

they heard or witnessed, than if they were in a theatre or a forum: they were there solely to enjoy Padre G——'s eloquent descriptions, to look about them, and to kill time.

DOMESTIC BOOKBINDING.

MUCH valuable literary matter is lost for want of binding; for many persons will go to the expense of the one, who grudge, or cannot afford, the other. We strongly recommend our friends to make all possible efforts and sacrifices with a view to getting their music, magazines, &c. bound for them; but if they cannot, or will not do this, we offer them a few suggestions on the subject of binding at home.

We know amateurs who take much pleasure in the art of bookbinding, and follow it with great success; but, to do this, there must be a workshop and the regular apparatus. Our object is to show how books may be bound without such apparatus, and at a small expense.

Some little preparation must, however, be made; and we shall describe what is indispensable. Take two flat pieces of plank of some hard wood, about 1½ inch thick, and somewhat larger than any book you may have to bind—say, 20 by 18 inches. Lay these planks together, and bore through them both three holes at either end, about an inch from the edge, and with an inch auger. Make six pegs of hard wood, six inches long, and fit them tightly into one plank on one side of it—that is, so that the pegs may all stand out at one side. Reduce the size of the pegs, so that they will pass freely through the holes in the other board, that by their means the boards may be separated or brought near to each other at pleasure. The board in which the holes are should be fitted with a backstay or two, so that it may support itself edgewise on a table, and the two together will thus form a sort of vice or press. For tightening this, arrange four large iron 'wood screws.' Holes must be bored in the outer plank, large enough to let the screws pass loosely through, but in the other plank, they should bite. When a book is in the press, the screws must be tightened so as to hold it firmly. This cheap and simple contrivance is susceptible of many improvements, as of screws with winged heads, specially made, &c.; but it will be found sufficient in its simplest form.

In addition to this, you must have a heavy hammer, twelve or fourteen pounds' weight, and round at the ends, to beat and compress the books. If near a foundry, you should make a model in wood or clay, and have it cast; but, in any case, the hammer is not very expensive. The glue-pot may be any little pot of crockery; but should never be put on the fire—melt the glue by placing the pot in a sauce-pan with water, and boiling that. Besides the glue-pot and press, you must have some scissors and cutting tools; and now for the mode in which you must proceed.

Suppose you had a year's monthly parts of this Journal to bind—first remove the covers and all papers not belonging to the text; lay the parts carefully together in order, striking the backs gently on the table to get them quite even. Then beat them on a block with the hammer, so as to compress and flatten them. Next put them carefully into your press, and tighten the screws, so as to hold them steady. Let about an inch of the back appear above the edge, and, with a common saw, cut four slots in the back at regular intervals, not deeper than the teeth of the saw. In each of these slots insert a cord, and to these cords secure with packthread all the little quires forming the book. This completes the first stage of the binding.

To aid in the sewing process, a square frame of light wood is necessary. The cords must be tied to

this above and below, and the lower portion of the frame should be so flat and broad that the book can lie on it. The cords being passed into their respective nicks, the binder must open the leaves regularly to find the middles of the little quires, and then pass, with the needle, the packthread along the inside, but twisting it round each cord in succession as he goes; making it fast at the end with a knot or hitch. When this is done, he must cut away the cords, except an inch and a half or so on each side, which should be left to form the attachment to the cover. He must now replace the book in the press, and give its back a good coat of glue, melted as described above. Leave it in the press till the glue is dry.

In the meantime, the binder can see and measure the breadth of back for which he will have to provide the cover, according to the following directions:

Cut two pieces of thin pasteboard a little larger than your book. Cut out also a piece of calico or linen, so much larger than both these every way, as to allow for the back and the 'turning in.' Paste, down the middle of this, three or four slips of the same calico, to strengthen the back; carefully measure its breadth and length, and lay on your covers, leaving the space of the back between them; turn in your calico round the edges of the covers, avoiding creasing, and the cover is made, and must be allowed to dry. Then take your book, unravel and soften the ends of cord, and wet them with strong glue. Lay the book carefully on its back into the cover, and glue down the cords to the sides. Support the book in this position by some simple contrivance, and glue down a slip of linen or calico to hold the cords steady. Afterwards paste, over all this, a sheet of white or fancy paper to line each cover, and the work is done when dry. We say nothing about cutting the edges artistically, as it requires a particular arrangement not contemplated here; but if you are ingenious enough to cut them clean and straight with a sharp knife, so much the better.

However simple or rough such binding may be, it is far better to bind thus than to let books go to ruin. As regards the edges, it may be added, that, previous to putting the book into its cover, it may be put in the press, bringing up each edge of the three exposed ones successively, and, while held thus tightly, should be cut with a sharp knife or shoemaker's cutting-tool. Any little inequalities may be smoothened down with fine glass-paper. The edges, when cut, may be dabbled with any colour desired, by using a big hair-brush and water-colours.

In speaking of the linen or calico for the covers, we, of course, intended something of the sort used by bookbinders, as it may be had of almost any colour.

We should strongly advise the amateur to make his own pasteboard. It may be done with old newspapers, at 3d. per pound, if none others can be had. If only done flat, and without creases or wrinkles, it is far stronger and better than that which is sold in the shops, and costs only a fraction of the price. The secret of making it good and even is, to wet the paper, independently of the paste to be employed, laying the sheets quite flat on each other, and, when nearly dry, placing them on a table or other flat surface, on which they should be secured with books or such things laid upon them, so as to force them to dry out flat. The last thing of all to be done is, to put the book as tightly as possible into the press, and leave it there for some hours.

We hope none of our readers whom it may concern will be discouraged from attempting bookbinding by the apparent complexity of the operations necessary for it. It is an amusing work enough; and the comfort of having books bound, and standing orderly on their shelves, will amply repay the trifling cost and trouble. Perhaps what we have written may be the means of

suggesting to more than one reader who can afford the proper apparatus, an amusing and useful mode of filling up a few leisure hours now and then. It should not be forgotten, that the art admits of the exercise of high artistic powers, and that it is allied to the fabrication of such little elegances as card-cases, work-boxes, *papeteries*, &c., on which taste and a decorative talent may be displayed to any extent. Supposing home-made pasteboard to be used, it is a good plan to press the covers, before using, as strongly as possible between the planks, as described above, leaving them for a night, or longer, if possible, under the pressure.

A BUTTERFLY.

Thou incarnation of the light,
Coquetting with the flitting sight,
Looking as if thou'd ta'en a flight,
Like winged flower,
Down from the sun's effulgent bright
And burning bower—

The flashes of thy filmy wing,
Like gaudy pennon's fluttering,
That o'er the seas of sunlight spring,
A bark of light,
And with the wavy breezes bring
Us beauty bright.

Thou star of day, I see thee shine,
Against the azure depths divine;
And where the twinkling tints combine
A flow'ry cell,
Thou feed'st on beauty rich as thine,
And loved as well.

The earth secreteth rubies red,
The sounding sea, its coral bed,
The lucid air creates instead
A living gem,
To wreath in circles round my head
Light's diadem.

W.S.

COPPER IN THE SEA.

Experiments are now in progress to shew that the sea is constantly charged with a solution of copper. M. Septimus Piesse caused a bag of iron nails to be kept from the sides of steamers passing between Marseilles and Nice, and obtained a precipitation of copper upon the bag. He finds the same metal in the substance of animals inhabiting the sea, and recommends the popular experiment of putting an oyster—a *bad one*, if possible—under the blade of a knife, and leaving it there for twenty-four hours, when, on the removal of the oyster, the copper will be found on the knife. In Mr Piesse's opinion, the beautiful blue colour of some portions of the Mediterranean is due to an ammoniacal salt of copper, while the greenish other seas is owing to the chloride of copper.

CURIOUS PARALLELISM OF CUSTOMS.

It is a custom in Berwickshire among women and children in the field, when their backs become much tired, to bowing low down while singling turnips with sharp-pointed hoes, to lie down upon their faces to the ground, and others to step across the lower part of their bodies over the lumbar region, with one foot, several times, until the sense of fatigue is removed. Burton, in his *First Footing in East Africa*, narrates a very similar custom in the East, who lead the camels, on feeling fatigued, and before they are full length, prone, stand upon each other's backs, and by rolling and kneading with their toes, and shaking, are refreshed.—*Notes and Queries*, June 20, 1864.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 188.

SATURDAY, AUGUST 8, 1857.

PRICE 1½d.

A POPULAR PREACHER.

I AM not a successful person, and I don't like a person that is so. When I am told of people who have caught the public ear or eye—an actor who draws full houses, a barrister who affects juries to tears, a poet who reaches a second edition, anybody, in short, who has done more than I have done—I feel a very natural antipathy for him, and adopt one of two courses: I deny that the thing is true; I have been to the theatre, and was the only creature in the stalls; I have been to the Old Bailey, and was convulsed with merriment at the pathos of the learned gentleman; I happened to know the publisher, and he confessed to putting 'second edition' upon all after the first fifty copies. Or else, admitting the success, I deny that it is deserved: the actor is a stick, the counsel is a pump, the poet is a fool. I find this practice, as a general rule, to be soothing to myself, as well as pleasing to my friends: the majority of whom also have been unfortunate in life, having merits that have never been appreciated, genius that has been ignored, and yearnings that have never come to anything.

Picture, then, our indignant sentiments when we heard of a certain reverend gentleman—one Boanerges—getting fifteen thousand people to listen to him in the open air. This, of course, was a frightful exaggeration; but then if there were only ten thousand? or even five thousand? Some of us were clergymen ourselves, and were, reasonably enough, excessively outraged. Well, we did what we could: we heard it from the best authority that there were barely five hundred in his chapel, and that each of those received a sixpenny-piece for going there; that after the first day's preaching, the novelty of the thing went off, and so did the congregation; that poor Boanerges was a seventh-day wonder which only lasted a week. The report then spreading that a gigantic place of worship, such as had not been heard of since Solomon's Temple, had been actually projected for the express purpose of accommodating Boanerges's hearers, followed by the certain news that one of the finest music-halls in London had been found insufficient for his audience. In the meanwhile, and that the very largest of all had been engaged instead—then, I say, we altered our tactics. Boanerges was (then) a Mormon, a Shaker, a Jumper, a Latter-day Saint. He belonged to the Agapemone, denied the rotundity of the earth, was in favour of a plurality of wives, habitually preached standing upon one leg, emphasising with the other upon the reading-cushion, and held dramatic dialogues with Adam, with Moses, and with Nebuchadnezzar. We were confirmed in this line of proceeding by

the religious newspapers, who, upon the occasion of a frightful accident occurring in his crowded congregation, asserted roundly that it served them, the sufferers, right. 'No man,' said one of them, 'is justified in collecting large assemblies who has not the power of controlling them'—upon an alarm of fire, for instance; after which it went on to describe what its Archdeacon Stratocote would have done in a similar emergency. Anti-Boanerges tracts also were published with strange interrogatory titles: 'Who is Boanerges?' 'Why is Boanerges popular?' 'Who is the Chief Heretic of To-day?' Not, of course, that we, or the newspapers, or the tracts cared sixpence what Boanerges was or was not, but on account of the fifteen thousand persons, more or less, who still kept going to hear him. People one meets at dinner-parties began to go; some of whom—Wilkins, for instance, a young man without a proper sense of respect for his superiors—thought fit to oppose my sentiments.

'Any man,' I had observed, 'who degrades himself to act the buffoon, will get thousands to come and see him do it.'

'There are more buffoons in the world than spectators,' retorted Wilkins.

'Sir,' said I, in a manner which is considered to be like that of the great lexicographer's, 'there are not. I maintain that if a man choose to play the actor in his pulpit upon the Sabbath-day, he will fill his house.'

'Nay; but we know not a few of those also,' persisted Wilkins, 'who have still several pews to let. I don't want to exalt my man unduly, but he shall not be sat upon.'

'Sir,' said I, 'did not this person address a man from his pulpit who happened to come into his chapel out of the rain, and stigmatise him as "an umbrella Christian?" Did he not on one occasion imitate a Baelge? Did he not, on another, run down his pulpit stairs, to illustrate the swiftness of a fall from grace; and toil up the same slowly, to picture the difficulty of repentance? Did he not call the established clergy "dumb dogs?" Did he not?'

'Perhaps he did, and perhaps he did not,' said Wilkins; 'I have heard you say he did, often enough; now, do you come with me next Sunday to hear him, and judge for yourself.'

I agreed to go. Horshair, who has been thirty years at the bar without stooping to any transaction with an attorney, and Humbleby, one of the most respectable of modern divines, offered to accompany us on the ensuing evening. We left all the arrangements to Wilkins. He said we must dine at four o'clock, in order to be at the music-hall before the

service commenced. This was very disagreeable to people of our years and position, and particularly as we could get nothing at the club till after six. We arranged, then, to meet at 'the Wellington' at fifty-nine minutes past three; and Humbleby and I were there, punctual to the minute. There was some printed statements upon one side of the door, setting forth that upon Sundays no table could be served till after five o'clock; we rang the bell, and found that even this hope was illusory, and that the earliest time of hope was half-past five.

Horshair and Wilkins kept us waiting in the east wind for near a quarter of an hour, during which my friend continuously observed that it served us both right, and that it was nothing more than he had expected. We then adjourned to a neighbouring chop-house, strongly recommended by our young companion, and partook of the very worst dinner that I have had since I was a school-boy: much as wine was to be desired on such an occasion, and particularly for the stale fish, there was no wine to be got until six o'clock. During this melancholy entertainment, Wilkins observed that he hoped we were all right about Boanerges, for he was advertised to preach at so many different places that one could never be quite sure. Humbleby was speechless with indignation; but Horshair and I gave the young man so much of our minds as to induce him to confess he was only joking. Immediately after cheese, we drove away in two hansoms to the music-hall: an hour's indigestion, turnpike-paying, and suffocation (for Wilkins would smoke) ensued before we reached our bourn, which seemed to be a long blank wall in a perfectly empty street. An official person with his back against it informed us that Boanerges only preached there in the mornings; and that in the evenings he preached at his own chapel, a mile or two off, in Southwark. Humbleby, who had quarrelled with Horshair coming along, immediately began to walk back again without any remark, and, as we afterwards discovered, had the misfortune to be garroted near to the South-western Railway Station.

We three drove on to the chapel, the street in front of which was filled with masses of people. Horshair, not knowing that Humbleby had previously paid the cabman, discharged the entire account over again, from which circumstance much dispute arose between the two friends; but there was no time to lose in inquiries, if we were to hear Boanerges that evening. Though we formed ourselves into a solid square of three, we had much ado to keep our position in the crowd, and could not advance one step. The great iron gates in front of the chapel were closed; but two strong currents of people were flowing in, by ticket, at the side-doors; 'a thoroughly Calvinistic notion,' as Horshair observed, whose forte, when disgusted, is sarcasm. Presently, the police let three great waves of outside folk through the main entrance, and then the inexorable iron closed for good: we were in the fourth wave next the bars. A deacon—one of those of whom Boanerges is reported to have said: 'Resist the devil, and he will fly from you; but resist a deacon, and he will fly at you'—here addressed us, and implored us to go away. 'Mr Boanerges himself has said that his chapel holds but twelve hundred to hear, and two thousand to suffocate; the two thousand are now in. Three streets off, there is good doctrine and a most

respectable minister—Ebenezer Chapel, first turn on the left hand.' This announcement was greeted by a general groan, the sentiment of which was 'Boanerges aut nullus;' and not till the opening hymn—it sounded like a song of triumph—was raised by the fortunate inmates of the wished-for place, did we in the street begin to melt away in twos and threes. In those unknown, ill-paved, unlighted, cableless regions, I claim credit for myself and Horshair that we did not do for Wilkins, who appeased us, however, in some slight measure by standing dinner—for we had had no dinner, in any high sense of the term—at the club.

On the ensuing Sunday, Wilkins called upon me at breakfast-time with two tickets: 'Admission for Lord's-day mornings' to the temple of Boanerges. I glared at him for a moment or two, and then consented to go. It was a beautifully clear day; the gardens in which the music-hall was built were crisp with frost, and their ornamental waters sparkled in the sun; the scene was more like one in Paris than in London; and the vast throngs of ticket-holders among the statues and the arbours, and in front of the great model of the Russian stronghold, seemed pleasure-takers rather than church-goers. The music-hall itself, with its hundred windows and long gilded galleries, with its printed announcements of 'Cloak-room,' 'Refreshment-room,' 'This Way to the Stalls,' and so on, which were suffered to remain in all their native profanity, contrasted strangely with the usual habitations of religion amongst us; two private boxes on either side the orchestra alone reminding one, by a sort of impious parody, of the grand old British pew. Upon the orchestra seats and fronting the vast assemblage, Boanerges's own particular flock were accommodated; and where the conductor's box was wont to be, was reared an enormous pen, by way of pulpit. How the folk kept flocking in!—for the most part, well-dressed—there were scarcely any poor among them—and quite as many males as females; the majority, like ourselves, with curious, half-smiling faces; but a large minority, too, with very demure ones, in whose, chiefly feminine, hands were a Bible and a ticket neatly wrapped up in a pocket handkerchief. These tickets, by the by, cost but twelve stamps for a course of four sermons, and, it is fair to state, go a very little way towards paying the hire of so vast a place, which is expected to be defrayed by the voluntary contributions of the congregation at the doors. The body of the hall and also the best seats in the galleries, were filled before the gates were opened to the general public, and the unticketed religious world rolled in upon us like a flood. In ten minutes, when the gates were closed again, there was not an empty seat to be seen. The whisper that threaded this great crowd dropped in an instant, and every man's head was bared, as if by magic, for we had come together, some of us at least, to worship, and lo! there was the preacher.

A middle-sized, unhandsome person, not above twenty-five years old at most, heavy-featured, rather flat-faced, straight-haired—but with what a voice! Without effort, without perceptible lift even, it filled that mighty temple with a volume of sound. A short opening prayer, somewhat remarkable for monotony, was followed by a hymn, which a man with a tuning-fork gave out from the orchestra seats, and the select few thereon began to sing; one not well-known to us, or in which most of the congregation could join, being

selected from some dissenting psalm-book; but, even as it was, the aggregate of voices made up a most impressive harmony. The preacher subsequently referred to this when speaking of 'the voice of many waters, and the voice of a great thunder, and the voice of harpers harping with their harps,' as also to his own sensations at different times when under such influences; and indeed he seemed to well understand what modern divines have mostly yet to learn, that an example from their own experience, or drawn from the present circumstances of their audience, is worth a thousand metaphors from earth, and sea, and sky. Boanerges never missed an illustration because of its homeliness, and, leaving abstract virtues and vices to abstract men and women, addressed himself to folks of flesh and blood. 'When I say *mammon*, I don't mean idle dukes or greedy merchant-princes; my small adulterating shopkeeper, I mean you.' And again, upon the importance of seeming trifles: 'There is many a man who will lose a thousand pounds without a murmur, and yet blaspheme about a shirt-button.' In the prayer before the sermon, he touched upon the subjects at present interesting the national mind, expressing in a brief, rough manner, too, the healthy popular opinion upon most things. For the country, for the Queen, he prayed; for the confounding of despots, for the extinction of slavery, and for peace; and for the high court of parliament, 'that it may do this coming session something, and not nothing, and that it may be vouchsafed, if it be but a little, wisdom.' Before this prayer, he gave a short exposition of the hundred and third psalm, more remarkable for eloquence than learning, in which he rejected, somewhat violently, the eagle's renewal of its youth as a wicked fable, and limited the parallel to the ordinary process of moulting; then followed more singing, and then the sermon, which was taken from the Revelations. It is not of course my purpose to repeat it in this *Journal*, or in any way to deprive the *Penny Pulpit* of its lawful prey; my only intention has been, and is, to give a brief impartial account of the public preaching of a very remarkable man. Now that I have been to hear him, and since scarcely any of my acquaintance have had the same opportunity, I feel that there is something to be said for Boanerges as well as against him. He seems to me to be thoroughly in earnest, to have great command of language, and to know his way to the feelings of his congregation; at all events, he knows their weaknesses, and attacks them boldly, face to face, without any masked batteries whatever; while that great voice of his is rolling over their heads, there is not a sound to interrupt or weaken it; and when he pauses to refresh himself at his glass of water, a tempest of coughing and nose-blowing proclaims at once the willing patience and real attention of his hearers. I know many wittier men than Boanerges, and I know one or two as eloquent, but I know none who could have preached such passages as this man did without a trace of flippant profanity, and with all appearance of religious earnestness: 'The name that was written upon the foreheads of the saints—what was it? B for Baptist, do you imagine, my friend Bigot yonder? W for Wesleyan? C for Calvinist? E, perhaps, for the establishment? *It does not say so here.* If you asked of the angel who keeps the gates of paradise whether there are any Baptists withinside, he'd shake his head. Any Calvinists?—he would not so much as look at you. Any of the establishment?—he'd answer: "*Nothing of the sort.*" They would all be there indeed, perhaps, my friends, but not in miserable sects and parties: they would be all Christians—saints.' There were many such—I was almost going to write 'hits'—striking illustrations during this sermon, the whole of which was upon that 'very disagreeable but true doctrine, my friends

—although indeed I am none of your strait-gate and narrow-way people—election.'

Finally, if I had to answer that before-mentioned tract called 'Why is Boanerges Popular?' I should answer, that he is so mainly because he combines real eloquence with what Luther possessed, and Latimer possessed, and which no modern preacher, except Boanerges, perhaps *does* possess—earnest religious humour.

PICTURE-WRITING OF EGYPT.

To commemorate events by tracing a representation of them on wood or stone is a natural expedient among rude people, such as the North-American Indians, who still practise it. This seems to have been the origin of the famous hieroglyphics of Egypt, which, in their first form, were simply a kind of picture-writing, and of general application, notwithstanding that the name—literally, *sacred sculpture*—implies an exclusively religious character. We can readily imagine, however, that to carve out the whole particulars of an event would be found troublesome, and that a short-hand process would be early called for. Apparently the first step would be to come to conventional signs. For example, instead of representing a battle by a combination of the pictures of men, horses, and warlike instruments, men found that they might depict it by two swords crossed; or they might indicate a victory by the head of the conquered laid at the feet of the conqueror. And besides these visible objects, men would soon desire to represent invisible things: they might, for example, in reckoning time, use the figure of the moon to designate a month. By and by, also, they would proceed to express *abstract* ideas; in which department they might, for instance, represent strength or power by the head and neck of a bull. This mode of conveying ideas, either by direct pictures, or by obvious conventional signs, is plainly suited for a people in the first stages of civilisation; but, as they advance, it becomes necessary to extend still further their writing, or communication of ideas by signs. The qualities of objects, and the passions and sentiments of living creatures, having no visible archetypes in nature, would, in the progress of time, be expressed by arbitrary marks or characters, which, being applied to the spoken language, would become the representatives of words, or portions of words, as among the Chinese; and, finally, some of these known characters would be appropriated to represent the elementary sounds of the spoken language—that is, an alphabet would be invented and introduced. The Egyptians, who were the most ancient of civilised nations, early arrived at this point—so early as the days of Moses, indeed, they seem to have attained that maximum of learning at which nations generally remain stationary for a longer or shorter period.

The true meaning of hieroglyphic writing was first unfolded by the ingenious labours of our own countryman, Dr Thomas Young, and the distinguished French archæologist, Champollion, near the beginning of the present century. But before proceeding to give a sketch of the art, as elucidated by them in modern times, it will be interesting to inquire what light was thrown on the subject by ancient writers. On this point, we might have expected to find in the *Father of History* some valuable information; yet, while the writings of Herodotus furnish us with ample details of the laws, manners, and customs, topography and buildings of ancient Egypt, it is to be regretted that he has given only a few scanty notices of the literature and language, and, as included in this, the method of writing among the Egyptians. He says nothing of their *picture-writing*, but merely mentions that they had two kinds of characters—*sacred* and *popular*—without leading us to suppose that these had any near connection.

Diodorus Siculus is the first in whose writings we find anything of the kind of any consequence. He lived in the first century before the Christian era; and informs us that the hieroglyphic art was confined to the priests, and that they communicated it only to their own children; but he makes no allusion to that *phonetic* character which recent investigation has shewn to be one of its essential principles. He tells us that all kinds of animals, and of instruments, especially those of the carpenter, were used to express ideas; but modern discovery has shewn that he is wrong in many of the examples he has given. An ancient father of the church, Clemens of Alexandria, who lived at the end of the second century, has given us, in his *Stromata*, or book of miscellanies, a description of the system in the following words: 'Those who are educated among the Egyptians, learn first of all the method of Egyptian writing called *epistolographic*; secondly, the *hieratic*, which the sacred scribes employ; and, lastly, the most complete kind, the *hieroglyphic*. Of these, one sort is the common way of writing, and another is symbolic.' Of the symbolic he describes three kinds: 'One,' says he, 'represents objects by imitation; another expresses them tropically; the third suggests them by certain allegorical enigmas.' This account of the Alexandrian presbyter has been shewn by modern discovery to be wonderfully accurate. Apuleius, a contemporary author, has also written on this subject; but his descriptions are confused and unsatisfactory. Porphyry, a writer of the third century, has been more successful, and has given an account of hieroglyphics somewhat similar to that of Clemens; but the fullest notice on the subject by any ancient author is that of Horapollon, a Greek grammarian of the fifth century, born in Egypt. His work, originally composed in the Egyptian language, has come down to us in a Greek translation. It is written specially on hieroglyphics, but is full of errors, and therefore, like the statements of Diodorus, calculated to mislead the student. Egyptian hieroglyphics seem to have attracted little or no notice from writers of the middle and later ages; and the first attempt to decipher them in modern times was by De Guignes, who, in the *Memoirs of the Academy*, 1759, declared that he 'thought he had perceived *alphabetic characters* among them'—a guess, however, which led to nothing. The discovery of the Rosetta stone at the beginning of the present century, was, as will be afterwards explained, the means of unravelling that mysterious kind of writing, the signification of which had lain concealed from mankind for thousands of years.

M. Champollion, who devoted upwards of twenty years to the study of Egyptian hieroglyphics, to prosecute which he went with an expedition of learned men to Egypt in 1828, at the expense of the French king, has shewn that, when reduced to a system, they consist of three kinds of characters or signs: 1. *Figurative* signs, or direct images of the things indicated; 2. *Symbolic* signs; and 3. *Phonetic*, or those expressive of sound. As all visible objects naturally come within the scope of hieroglyphic characters, it might be supposed there would be almost no end of them; but they appear to have been limited, for the whole number observed by Champollion, after the most diligent and minute investigation, was about 800 real figures of natural objects, and about sixty more of geometric figures and fantastic forms.

I. *Figurative*.—This class is also sometimes called *pure hieroglyphics*, and is subdivided by Champollion into 1. *Figurative proper*; 2. *Figurative conventional*; and 3. *Figurative abridged*. All direct images of things signified, as *sun*, *moon*, *star*, are examples of the first kind. As an instance of the second kind, may be mentioned a *section of a ceiling*, to represent the *sky* or *firmament*—a very obvious symbol, though not a direct one. An example of the third kind is when only a part

of the object intended to be represented was given, as the *plan of a house* for the house itself.

II. *Symbolical*.—Abstract ideas, having no visible objects by which they can be directly represented, were expressed by images used symbolically. Thus, two arms stretched up towards heaven, expressed the word *offering*; the *wind* is signified by a hawk on the wing; *writing*, by a reed and an inkstand, &c. It is to these symbolical figures that ancient writers, when speaking of hieroglyphics, have generally alluded. They are naturally more difficult of interpretation than direct images; and as a mistaken notion prevailed that all the figures in Egyptian monuments were symbolical, this error occasioned for ages among the learned the most extravagant and contradictory interpretations, which were not got rid of till the researches of Young and Champollion cleared away the difficulty. It may be noticed, in passing, that hieroglyphics of the symbolical kind are also used among Christians: for instance, a triangle in a circle is employed to represent the Trinity in unity; and sometimes an eye is introduced in the centre, in allusion to the divine omniscience. Again, an anchor is used as emblematical of a Christian's hope and constancy; and the figure of a cock for Christian vigilance.

III. *Phonetic*.—The two kinds of hieroglyphic signs already described were not sufficient to express the various ideas of so highly civilised a people as the Egyptians, and this no doubt led to the invention of the third class, called *phonetic*, or those expressive of sounds, the principle of whose construction is as follows: The figures of certain objects were used to represent the initial sounds or letters of the words standing for those objects in the Egyptian or Coptic. For instance, in that language *ahom* is an eagle, and the figure of an eagle is therefore made to stand for the initial letter *a*; *berbe* is a censer, and so the figure of a censer stands for *b*; *jai* is a swallow, and the figure of that bird stands for *j*; and so on of other words, till an alphabet is formed. But as the figure of every object which began with *a* in the Coptic might stand for that letter, it might be supposed that this principle would lead to endless confusion and difficulty; and so it would, had the signs not been limited. But they are really restricted, eighteen or nineteen being the largest number of images assigned to any one letter, while few have more than five or six, and some only one or two.

The merit of the discovery of the phonetic alphabet has been by some ascribed to Champollion; but it has been proved by good authority, as will afterwards appear, that Dr Young was, beyond all dispute, the original discoverer, so long ago as the year 1818. Young, unfortunately, did not follow out his inquiries in that direction, his attention being chiefly confined to another department of the art, the *enchorial* method; but his discovery may be regarded as the foundation of Champollion's future success in this province. There is no doubt that the enterprising Frenchman had long before this occupied himself with the study of hieroglyphics; and he afterwards declared in his great work, *Précis du Système Hiéroglyphique*, that 'this phonetic alphabet is the true key of the whole hieroglyphical system;' and that 'all hieroglyphical legends and inscriptions are composed principally of signs purely alphabetical.' This may be so; yet it is a fact, that all the sorts of characters, figurative, symbolical, and phonetic, are used together. It might have been supposed that such a complication would have been a most perplexing obstacle to the deciphering of hieroglyphic monuments; yet Champollion and others acquired great skill in interpreting what had been so mysterious for thousands of years, and could read most of them with comparative ease.

There is another important distinction to be attended to in this subject. The ordinary style of hieroglyphics found represented in bass-reliefs and paintings on the

walls of public buildings, and descriptive of historical scenes and civil and religious ceremonies, were no doubt intelligible to all well-educated Egyptians; but there was another kind discoverable in the interior of their temples and sepulchres, which was of a more enigmatical character, spoke a language more strictly ideographical and mysterious, and formed an allegorical representation of the religious and philosophical doctrines of the Egyptians. Like the *esoteric* doctrines of the ancient philosophers, none but the initiated were suffered to inquire into them—the key to them was kept exclusively in the hands of the priests. For this reason, this department of hieroglyphics was termed *hieratic*, indicating that it belonged more peculiarly, if not exclusively, to the priesthood. It is a sort of hieroglyphical *stenography*, or short-hand writing, in which the form of the signs is considerably abridged. Various existing manuscripts exhibit this species of hieroglyphic writing, belonging to the Pharaonic, Greek, and Roman epochs of Egyptian history; and it seems to have been confined to the transcription of texts and inscriptions connected with religious matters. It is distinguished from that other mode of writing already alluded to, the *enchorial*, so called by Dr Young from its being of peculiar use in that country, but termed by Champollion *demotic*, because it comprehended the characters or style of writing used by the common people. It has also been denominated *epistolographic*, from its fitness for letter-writing. It is almost entirely alphabetical, containing few symbolic signs, and scarcely any direct figures, and these so much simplified as to lose nearly all resemblance to the objects expressed. It formed a sort of running-hand; and from its being written in the direction from right to left, it resembles the writing of the Hebrew and other oriental tongues.

But we come now to a most interesting part of this subject—that remarkable discovery of the Rosetta stone, by which the interpretation of hieroglyphics was first placed on a true and solid foundation. It has been said, that if the invention of fluxions by Newton, and of the *differential calculus* by Leibnitz, is considered as the most brilliant proof of the calculating and abstractive power of the human intellect, the deciphering of hieroglyphics, which for thousands of years lay before us a sealed book, may well be called the master-piece of criticism. When the French took possession of Lower Egypt in 1798, it was part of the policy of that remarkable man who then ruled their destinies, and who had, a short time before, made that memorable declaration to the Institute of France—“The true conquests, the only ones which do not cause a tear, are those which are gained over ignorance”—it was part of Napoleon's policy to associate with his army a company of literati, for the purpose of investigating the geography, natural history, and antiquities of that once famous land, the nurse of learning and civilisation—an inquiry in which no one seemed to take a greater interest than their distinguished commander himself. It was not, however, in the course of these learned investigations that the discovery alluded to was made; it originated purely in an accident; it was one of those coincidences, undesigned by man, by which often good is brought out of evil; for, in this case, what was designed for deadly war, tended to the enlargement of man's knowledge in the arts of peace.

While the French troops were excavating for the foundations of a fort to be erected at Rosetta, a town near the mouth of the Nile, they dug up a large block of basalt, containing an inscription in three compartments, and each bearing a distinct character. When the valour of Abercromby wrested Egypt from the republican yoke, by the battle of Alexandria in March 1801, it is curious to remark what was the fate of this stone. The opposite parties, without being aware of

its value, raised a contention about it that seemed prophetic of its future importance, and some account of which deserves a short notice. An end being put to the war by the surrender of Alexandria in the end of August, it was proposed that the collections of antiquities which had been made by the French savans should be considered as public property, and be given up to the British; but in the discussion that ensued, Menou, the French commander, asserted that they were private property; and he had selected the Rosetta stone for himself, and had caused it to be carefully packed up. After much dispute, however, the monuments and manuscripts were surrendered to Lord Hutchinson, the British commander, and the insects and other animals were ceded to the French, who, in anger, tore the covering from the Rosetta stone, and threw it down upon its face. It was at length safely embarked on board a captured frigate, along with many other valuable relics, carried to England in February 1802, and, by order of George III., deposited in the British Museum, where it may be seen in the Egyptian Saloon, No. 24.

This stone was found, on examination, to record a decree in honour of Ptolemy Epiphanes; and the lowermost division, which is inscribed in Greek, concludes with these words: ‘This decree shall be engraven on a hard stone, in sacred, enchorial, and Greek characters.’ So that it exhibits a specimen of hieroglyphics with a double translation, first in enchorial or common letters of the country, and second in Greek. The Society of Antiquaries caused a fac-simile of the inscription to be distributed among the learned in Europe and America. Porson in England, and Heyne in Germany, the two greatest Greek scholars of the age, furnished a version of the Greek; but this, however arduous a task it may have been, owing to the mutilated condition of the stone, was not the greatest difficulty. Of the first and second inscriptions, the hieroglyphic and enchorial, not a single character was then known, and therefore no comparison could, at first, be instituted between them and the Greek. The distinguished oriental scholar, M. Silvestre de Sacy of Paris, applied himself to decipher the enchorial, and found there two groups of characters in situations corresponding with the words *Alexander* and *Alexandria* in the Greek compartment, and which were therefore supposed by him to represent these names; but he could not get beyond this, and abandoned the attempt as hopeless. Mr Akerblad, an attaché of the Swedish embassy at Paris, entered on the investigation at the point where De Sacy had left off, and demonstrated what the other had only conjectured—namely, that the enchorial text contained Greek proper names, written in Egyptian or Coptic characters. He made some approaches towards the construction of an alphabet; but he failed in completing one from two causes: first, from supposing that the whole of the inscription was alphabetical; and, secondly, from the error of expecting to find all the vowels in the Egyptian words, in place of assimilating these with the Hebrew, Arabic, and other oriental languages, in which the vowels are mostly left out.

In 1814, Dr Thomas Young, a native of Somersetshire, and foreign secretary of the Royal Society, entered on the work which had baffled his predecessors. He began with the enchorial inscription; and, with the assistance of Akerblad's ‘conjectural’ alphabet, and by a careful comparison of the different parts with the Greek text, he was, after the labour of some months, enabled to form a translation, which he gave to the public in the *Archæologia* in 1815; and four years afterwards, he produced, in the article ‘Egypt,’ in the supplement to the *Encyclopædia Britannica*, an enlarged digest of his researches, which has been pronounced to be ‘the greatest effort of scholarship and

ingenuity of which modern literature can boast.' The result of Dr Young's labours was to demonstrate that, both in the hieroglyphic and in the enchorial texts of the Rosetta stone, certain characters were employed *phonetically*, or to represent sounds. He thus exhibited a phonetic alphabet, comparatively so extensive, that few additions of any value have since been made to it; and, by laying the foundation of a hieroglyphical one, he led the way to the true knowledge of that hitherto mysterious mode of writing.

Champollion laboured in the same field; and the priority of discovery between him and Dr Young has been much disputed. For a full and fair statement of the case, the reader is referred to the *Edinburgh Review* for December 1826, in which the writer comes to the conclusion, that 'Dr Young has the exclusive merit of having solved an enigma, which had for centuries baffled all the resources of the learned.' This, however, does not detract from the great merit of Champollion, in rearing up, by his unwearied labours and perseverance, an enlarged superstructure on the foundation laid by Dr Young.

The Rosetta stone contains only the last fourteen lines of the hieroglyphic text, and that, too, in a mutilated state; and the part of the Greek text which corresponds to these lines is, unfortunately, all defaced with the exception of one word; so that any extensive comparison between these two inscriptions is precluded. But it was the good-fortune of Champollion to discover another monument calculated to throw light on the subject in Philæ, an island of the Nile, once famous for its religious importance under the Pharaohs, and still remarkable for the number of its ruins. This monument is an obelisk with a hieroglyphic inscription upon it, which rested on a base bearing a Greek inscription. By means of these, he was enabled to form a hieroglyphic alphabet, with which he proceeded to decipher the proper names inscribed on the temples and other buildings of Egypt; and at length, in 1824, he published his great work, already alluded to, *Précis*, &c.; a most valuable production, which not only gives a clear view of the results previously obtained by himself and others, but contains a great variety of new matter. By a series of readings indicating profound scholarship, he has shewn that there is a phonetic alphabet applicable to the hieroglyphical legends of every epoch of Egyptian history; that this phonetic alphabet, as has been already mentioned, is the true key of the whole hieroglyphic system; and that all inscriptions in hieroglyphics are composed principally of signs purely alphabetical. He has traced these phonetic signs from the death of the Roman emperor Antonine Pius, 161 A.D., up to the conquest of Alexander the Great, in 332 B.C.; again, from Alexander's time to the Persian conquest by Cambyses, 525 B.C.; and thence through the different Egyptian dynasties as far back as to the beginning of the eighteenth, about the year 1874 before the Christian era. He has thus been enabled to verify the chronology of Manetho as preserved by Josephus, which had been previously treated with neglect, and has thereby shed a strong light on a portion of ancient history which, before his time, was enveloped in obscurity and doubt.

An attempt has since been made by two French writers—M. Klaproth and M. Dujardin—to invalidate the discoveries and the system of Young and Champollion; but on the whole, they have not succeeded in establishing any serious objection. More recently, the Rev. C. Forster has appeared to dispute their system. He has endeavoured to shew that hieroglyphic writing is *entirely* phonetic, and that the pictorial figures are to be taken merely as illustrations; but others, who have well considered the subject, think that this doctrine is refuted by certain inscriptions published by the learned Egyptian scholar, Mr Birch, so lately as 1853. It is

possible that the results of the great discoveries of Young and Champollion, in deciphering the Egyptian hieroglyphics, are not perfectly satisfactory, and not yet complete; but though the speculations of Forster are highly ingenious, and in some respects valuable, they have failed to undermine the general principles of the system of those two learned hieroglyphicists.

CATHERINE OF WÜRTTEMBERG:

ROYAL LIFE IN THE NINETEENTH CENTURY.

AN act of graceful homage has recently been paid to the memory of Catherine of Württemberg, the second wife of Prince Jerome Bonaparte, and the mother of Prince Napoleon, who has of late attracted so much attention in the European world. The heart of the ex-queen of Westphalia, enclosed in an urn, has been deposited in the tomb of the Emperor Napoleon at the Invalides. It is, as has been well observed in the *Times*, 'the heart of a noble woman, of one whom we entreaties of her father, the king of Württemberg, could induce to abandon her husband in his days of adversity, and who clung to him in evil report and good report to the hour of her death.' The circumstances of her life are so full of deep and touching interest, that we trust our readers will not unwillingly follow us in some passages of her changeful and eventful career.

At the commencement of the present century, the ancient palace at Stuttgart was the peaceful and happy abode of the ducal family of Württemberg, whose position, although high enough to secure for them the homage and respect which is due to the princely houses of Europe, yet seemed not lofty enough to expose them to the political dangers so often entailed on the more elevated and ambitious potentates of Christendom. The great social revolution, however, which had shaken continental Europe to its very foundations, came to disturb the tranquil happiness of the Württemberg family. Napoleon the Great, now seated firmly upon the imperial throne of France, resolved that a crown should also encircle each of his brothers' brows. The throne of Holland had been bestowed upon Lucien Bonaparte; Joseph was the king of Spain; and a new kingdom—that of Westphalia—was about to be formed for Jerome. There was, however, one serious obstacle in the way of this latter arrangement: Jerome had, in defiance of his brother's wishes, wedded himself to an American lady, who had recently presented him with a son. Napoleon was seriously displeased at this union, and refused to acknowledge its validity. Jerome, warmly attached to his wife, came over to Europe, and throwing himself at the emperor's feet, besought his pardon, and earnestly entreated him to receive his spouse as a member of the imperial family. This request was made at an unskoward moment; for Jerome's interview with the emperor took place at Milan, in 1805, just after he had grasped the iron crown of the ancient kings of Lombardy, bearing this proud yet beautiful device:

Dio me la diede;
Qual che la tocca.

It was at this proud moment of his life that Jerome asked him to receive a plebeian sister from republican America! The request was indignantly refused. Jerome shed tears of passionate affection as he embraced his wife's portrait, and swore never to give her up for any paltry consideration of earthly grandeur. He, however, lacked the firmness and resolution by which the Bonaparte family were so eminently characterised; and when the temptation of a kingdom with its power and its pomp, was held out to him, he gradually became less vehement in his denials, and finally yielded to the will of his imperious brother. His wife was abandoned, and

offspring disowned, and Jerome stood alone, a weak and guilty man, ready to sacrifice honour, affection, and duty upon the base altar of earthly ambition.

And now, who is to be his partner upon the newly erected throne of Westphalia?

Napoleon turned his glance towards Württemberg, which had recently been raised to the dignity of a kingdom, and whose sovereign was now degraded into a satellite of imperial France. The princess-royal had just completed her twentieth year. Fair in person, and amiable in disposition, this youthful princess possessed, nevertheless, far more firmness than her royal parent, and she resolutely expressed her aversion to the proposed alliance, regarding Napoleon as the direst foe of her native Germany; while at the same time she felt her maiden dignity deeply offended at the thought of being espoused to a man who, in her estimation, was already married to another. Vain, however, were all her remonstrances. She was compelled to bow beneath the iron will of Napoleon the Great, with whom her father was at this time closely allied; and before many months had elapsed, she found herself wedded by proxy to Jerome, king of Westphalia, and had entered the confines of France as the acknowledged sister of its imperial ruler. She was obliged, in compliance with court etiquette, to part on the frontiers with all her German attendants, and to advance alone in a foreign country, surrounded indeed by a brilliant retinue, but with no familiar face to meet her saddened gaze; no sweet sound of home voices to soothe the bitter feelings of her heart. With the characteristic firmness of her disposition, however, she gathered up all her courage to meet the trying circumstances of her lot, and seemed resolved that no tell-tale glance should betray the hidden conflict of her heart. As she drew near to Paris, the whole current of her being seemed to be changed; the usual kindness of her manner became petrified into a proud and frigid bearing; and while she was studiously courteous to her attendants, her evident constraint gave a disagreeable expression to her countenance.

It was on the 20th of August 1807 that, at an early hour of the day, she found herself almost in sight of Paris; but it being Napoleon's pleasure that she should not enter his capital until evening, she was conducted by his order to Raincy—a charming country residence, once the abode of royalty, but now the possession of Junot, Duc d'Abrantes, whose wife was commanded to receive the princess with all the honour due to her elevated rank. The duchess received her *en demi toilette de cour* on the grand peristyle of the château, and conducted her to her own apartments, where a repast of the most costly description was prepared for her refreshment. She courteously insisted on Madame d'Abrantes and her friends partaking with her of breakfast; and the animation with which she talked might have bespoken a mind contented with its lot, but that the rapid changes in her countenance revealed only too clearly the inward conflict of her heart. At one moment, her features were suffused with the deepest crimson, and at another they became livid with a deadly pallor.

The afternoon was filled up with a drive through the Forest of Bondy, during which the princess still courted herself to appear pleased with the efforts made for her amusement. Next came the grand affair of her toilet, which seemed to Madame d'Abrantes a matter of the utmost importance at this critical moment of the princess's life. She anxiously awaited her appearance in the saloon before dinner. What was her dismay on beholding the royal bride enter the apartment clad in a style of old-fashioned magnificence that might have suited her grandmother, but which was ill befitting the court of the Tuileries in 1807. The material was a bluish moire—at that time

quite out of date—cut out into a scanty narrow frock with a short round *queue*, exactly resembling a beaver's tail; the sleeves very narrow and very flat, looking as if her arms had been squeezed into them; and then the shoes pointed, as if they had been made some centuries ago. Around her neck hung two rows of pearls, from whence was suspended a miniature of Jerome, so clumsily set that it swung about at each movement of the wearer. In spite of this antique costume, the appearance of the princess was pleasing and attractive. She is described to us as 'of a fair and fresh complexion; her beautiful light hair and blue eyes harmonising well with the graceful and dignified turn of her head, and she entered the apartment with as much princely self-possession as if she had been attired under the direction of the imperial *coiffeur* and *modiste*—personages of such importance as to be remembered even now under the names of Charbonnier and Leroy.' Before dinner was announced, Catherine's agitation became so evident to her hostess, that the latter ventured to inquire whether ought had occurred to disturb her royal highness. Catherine, in reply, expressed her wish to be informed a few moments before Jerome's arrival, so that she might be prepared to meet him. This was promised; and while the princess thanked Madame d'Abrantes for her kind readiness to oblige her, 'the burning blushes on her cheek revealed no pleasing emotion, but the passionate pain of an indignant woman's heart.'

'The dinner,' Madame d'Abrantes writes, 'was dull, and even mournful. The princess was restless and agitated. Having asked her twice which she would prefer—taking coffee and ice in the park, or in the grand saloon, she seemed suddenly to recollect herself, and looking at me as if she scarcely understood the purport of my question, replied: "Just as you please."

'We quitted table at half-past six, and feeling anxious to satisfy the princess's wishes, I went to inquire whether there was any symptom of Jerome's approach. Just at this moment, a cloud of dust became visible on the road from Paris, and several carriages were seen to enter the poplar avenue. I hastened to inform the princess that in a few minutes the prince would make his appearance. With a faint attempt to smile, she thanked me for my kindness; but her appearance really alarmed me; for in a moment her whole countenance became of a deep purple hue, which was immediately succeeded by the cold blanched colour of death. She seemed, however, to summon all her resolution, and, rising from her seat, advanced with one of her ladies-in-waiting to the grand saloon, to await the prince's arrival. This apartment communicates at either end with the music-saloon and billiard-room, from both of which it is separated only by pillars, so that we who were assembled in the billiard-room could see all that passed in the central saloon.

'Catherine of Württemberg seated herself near the chimney, having by her side an arm-chair, intended for the prince. The door of the music-saloon opened, and Jerome entered, followed by the officers of his household, who remained in the outer chamber, while the prince advanced alone into the saloon where Catherine awaited him. She rose up, advanced a step or two towards him, and saluted him with much grace and dignity. As for Jerome, his aspect was that of a boor, who looked as if he had come there because he was ordered to do so. He approached the princess with an air of *brusquerie* and *malaise*. After a few words had been exchanged between them, she pointed to the chair near her; and a brief conversation ensued about her journey. Before long, Jerome rose up, and, in the tone and style of a *bourgeois*, said to her: "My brother is expecting us. I do not wish to delay the pleasure he will have in welcoming you as his sister." The princess smiled and bowed acquiescence; but scarcely had Jerome withdrawn

from her presence, when she fainted away. We carried her to the open window, and bathed her temples with Eau de Cologne. In a few moments, she recovered herself, and attributed her indisposition to the excessive heat of the weather; but I understood only too well the bitter conflict of womanly feeling and of royal pride which was raging in poor Catherine's breast, not to guess at the true cause of her indisposition.'

When Madame Junot announced to the princess that her equipage was ready, she rose up, and, gracefully thanking her for her kind hospitality, said that she was ready to depart.

What were the desolate feelings of poor Catherine's heart during this twilight drive from Rainey to Paris, no human being knew, nor what were her miserable anticipations of the future that lay before her. On her arrival at the Tuileries, she found the whole imperial family assembled to receive her. The emperor advanced as far as the grand staircase to bid her welcome. She attempted to kneel and kiss his hand, but he hastened to raise her up, and after embracing her, conducted her into the saloon of the throne, where he presented her to his assembled family as their sister and daughter. She was immediately surrounded, caressed, and treated from that moment as a sister of the emperor.

Such were the opening scenes in the wedded life of Catherine of Würtemberg. Need it be added that her after-path was one beset with thorns rather than strewn with flowers? Forced to bestow her hand upon a man from whom she instinctively shrunk, as being in her opinion already espoused to another, the unhappy queen of Westphalia had not even the poor satisfaction of being treated with respect by her royal husband. Many were the humiliations which she suffered at the court of Cassel, and she bore them all in silence. Faithfully did she strive to fulfil the onerous duties of her position, and never was a single murmur suffered to escape her lips. The only happy moments of her crowned life were those in which she clasped her infants to her arms, although, perhaps, the name of Napoleon, which had been bestowed upon her son, often brought a pang to her heart, as reminding her of him through whose insatiable ambition a hopeless blight had fallen upon her opening life.

Time passed on. The eventful years of 1814-15 elapsed. Napoleon had fallen, and those modern dynasties, which had flourished in the sunshine of his power, were withering away beneath the shadow of 'the Holy Alliance.' The queen of Westphalia had taken refuge, with her children, beneath her father's roof. Jerome had joined his brother Napoleon in Paris on his return from Elba, and had carried with him thither all the baubles of royalty, in the hope that, at no distant day, he might once more appear in public with these insignia of power. In this expectation, however, he was quickly disappointed, and, on the evacuation of Paris, he retired with the army beyond the Loire. His situation being now a very precarious one, he gladly accepted a refuge in the Château of Douy, where, under the assumed name of Garnier, he was hospitably entertained by M. Ouvrard, the eminent financier. Owing to the frequent presence of military men who were quartered in the château, Jerome was obliged to remain secluded in his own apartments. One day, in a moment of ennui, the ex-monarch opened a trunk, took out his royal robes of state, together with the many brilliant orders which had been bestowed upon him in his happier days, and clothed himself in all the magnificence of royalty. Just as his splendid toilet was completed, the door of his apartment opened, and M. Ouvrard entered. The discreet financier was astonished at such an act of imprudence on the part of his guest, and fearing that a repetition of his folly might betray his secret to the

whole household, and thus involve the family in political danger, he counselled Jerome no longer to delay his escape out of France. On the following morning, before daylight, the deposed king was on his way to the eastern frontier, whence he hastened to Stuttgart, and, entering in secret his father-in-law's palace, besought his wife to procure for him a welcome in the home of her childhood and her youth. The princess, mindful only of her husband's forlorn position, welcomed him heartily to her apartments. The news of his arrival, however, quickly reached the ears of the king of Würtemberg, whose political position made him shrink from communication with any of the Bonaparte family. On the following morning, therefore, he signified his pleasure to the ex-queen that her husband must forthwith quit his palace, as he could not harbour beneath his roof one of a proscribed and outlawed family, pointing out to her at the same time the example of Maria-Louisa, who had consented to a separation from her husband. He also expressed his desire for an interview with his daughter, that she might learn his wishes more emphatically from his own royal lips. The princess-royal immediately addressed to her parent a reply, which merits a place in the annals of all those nations where women are counted worthy of honour as well as of love. It was in the following terms:

'SIRE—Your majesty has summoned me this morning to your presence. For the first time in my life, I have denied myself the pleasure of obeying your commands. Knowing the subject of the interview, and fearing that my mind was not sufficiently collected to speak of it, I venture here to unfold the motives of my conduct, and to make an appeal to your paternal affection. Your majesty has been rightly informed; yes, sire, Prince Jerome, your son-in-law, my husband, and the father of my children, is with me. I received him from your hands at a time when his family reigned supreme over many kingdoms, and when his own brow was encircled with a crown. The bonds imposed at first by policy have since then been strengthened and confirmed by the feelings of my own heart; and he is far dearer to me now, in the hour of his adversity, than ever he was in the time of power and prosperity. Marriage and nature impose duties which cannot be affected by the vicissitudes of fortune. I know these important duties, and I desire to fulfil them. I was once a queen, and I am still a wife and mother. Although raised by fortune above other men, we are often only the more to be pitied. A will at variance with our own may influence our destiny, but there its power ceases, for it can by no means affect the obligations which Divine Providence has imposed upon us. The husband who was given to me by God and by yourself—the child whom I have borne in my bosom; these are now a part of my very existence. With this husband, I shared a throne; with him, will I share exile and misfortune. Violence alone can separate me from him. But oh! my father, my sovereign! I know your heart—your justice and the rectitude of your principles; I know what those principles have ever been on the subject of domestic duties. I do not ask your majesty, out of affection towards me, to make any change in the line of conduct which has been adopted in conformity with the determination of the most mighty sovereigns of Europe; I only crave your permission that my husband and I may remain near your person. But oh! my father, my sovereign! if this boon is denied us, let us at least be assured of your favour and kindness before we set out for a strange land. Without some proof of your paternal love, I can scarcely find courage to appear in your presence. If we must depart at once, let us bear with us at least the assurance of your affection as well as the hope of your protection in happier times. Our misfortunes will surely one day have an end. Europe will not

always command our humiliation; it will not always delight in degrading princes who have been recognised by former treaties, and who are allied to the most ancient and most illustrious houses in Europe. Is not their blood mingled with our own? Pardon me, my father and my sovereign, for having thus expressed myself, and deign to let me know that this letter has not been received with displeasure. Believe me, &c.

CATHERINE.

This touching and noble appeal could scarcely fail to melt the heart of a father; but political motives were at that critical period far more powerful in the breasts of monarchs than the gentler voice of domestic affection. The Princess of Würtemberg, together with her husband and son, were obliged to quit that Fatherland to which she was so tenderly attached. They took refuge in the Papal States, where they lived for many years under the name of the Duke and Duchess of Montfort. They chose a country habitation named Casino Azzolino, near the river Trento, which forms a limit between the Roman and Neapolitan states. Even here, however, they could not escape the humiliations which were at this time the portion of the Bonaparte family. They were prohibited by the king of Naples from entering his dominions, and so rigidly were his commands enforced, that the Countess Conrurata, a niece of Jerome's, having ventured one day, in a girlish freak, to cross the Fiume Trento for the sake of enjoying a ride in the Neapolitan territories, she narrowly escaped being seized by the Neapolitan soldiers, who were placed there to guard the bridge. The young and ardent countess was exceedingly indignant at this curtailment of her liberty.

'*Napoleon's* niece,' exclaimed she, dwelling emphatically upon this word—'*Napoleon's* niece is not made to have her walks dictated to her; she is not the vassal of any sovereign!'

The Duke and Duchess of Montfort had all the difficulty in the world to calm her anger, and to prove to her the necessity of submitting to the ungenerous restriction imposed by the king of Naples. As for Catherine of Würtemberg, she pursued the even tenor of her way, treading in the same path of duty and affection until death closed the earthly portion of her existence. We know not what were her father's feelings on hearing that she had died in the land of her exile. But whatever they were, the memory of Catherine of Würtemberg is still fresh in many hearts; and although she did not live to witness the realisation of the hope expressed in her letter, yet to her children has it been given to enjoy the blessing of restoration to their country, and also to share in those imperial honours which have once again become the portion of Napoleon's family. Perhaps we need scarcely add, that Prince Napoleon and Princess Mathilde are the sole descendants of this noble-minded woman. No higher honour could be sought for or desired than to be the children of such a mother.

NOTES ON NATURAL HISTORY.

The great masters of natural history have left but little to be done by mere gleaners like myself; but I believe there are few persons of ordinary observation who might not contribute something, which would either interest from its singularity, or add to the common stock of knowledge. It is my purpose to collect in this paper a few such waifs and strays of observation touching birds as strike me to be worth preserving.

To begin with the kingfisher. This bird has been well styled the only one which, in our islands, decks itself with a plumage of tropical richness and lustre. How rarely is it seen!—how shy of observation!—and how dazzlingly splendid when its green and crimson

metallic scales, as one may call them, reflect the rays of the sun! I have seen this bird in an almost half-domesticated state—that is, I have seen it in a certain pleasure-ground remain on some old timber hanging over water, until we had come so near as to have a perfect view. It—or rather they, for there were several of them—ran about briskly while we approached, and then only seemed to retire a short way among the water-weeds. I am reminded here of an anecdote for which I can vouch, and which shews that the kingfisher has a remarkable tenacity of life.

One of these birds flew, one day, in some unaccountable way, into the open windows of a country-seat in Berkshire. It entered a drawing-room by one window, and dashed at another which happened to be shut. Of course it fell struggling to the ground, stunned, if not killed, by the shock. The ladies, who alone were present, summoned the butler to put the poor creature out of pain. This he did effectually, by 'wringing its neck' in the ordinary way, and depositing it on a table, in order that its beauty might be admired by the whole family. Here it lay for some time, to all appearance quite dead; but at length some slight motion was perceived about its head—the head evidently was moving a little; and by and by this said head began slowly to turn round and round, which gyration was performed some five or six times, answering no doubt to the 'wrigs' inflicted by the ruthless hand of the butler aforesaid, until at last it seemed to have recovered its natural position. Thus it lay with open and glittering eyes for a short space; and then, as if instinct with new life, it made a sudden effort, flapped its wings, flew to the open window, and disappeared!

This recalls a somewhat similar instance of a partridge. This bird—an old cock, I warrant him—was knocked over in the usual way 'in stubbles and turnips.' He was picked up while yet struggling, and his head severely knocked on the stock of a gun by one of the party. He was then 'hung by the neck' with some others in a net by a leather strap contrived for the purpose. In this durance, the poor animal remained during the rest of the day and the following night, being hung up with the bag in the gun-room. On the following day, when the keeper proceeded to hand over his prey to the cook, this bird was shaken out of his collar upon the table; whereupon he immediately got on his legs, looked about him, flew straight at the window, through a pane of which he broke his way, and escaped!

I will here mention an anecdote of another kind connected with birds, which has always struck me as most extraordinary.

I had obtained from the nest three young bullfinches, and had had them several days in perfect apparent health: they could feed alone, and seemed quite strong. One morning, they seemed, in the very act of awaking, to be all seized together with some sudden fit. They fell from the perches into the sand at the bottom of the cage, beating it about most violently with their wings, rolling over and over, and exhibiting the same appearance as wounded birds generally do. After perhaps two minutes of these extraordinary gambols, they all alike seemed to get rid of the exciting cause, whatever it was; they ceased to struggle; sat up languidly on their tails, steadying their panting bodies with their wings; and at length quite recovered their usual health. About ten days after, the same *simultaneous* seizure was repeated; they all fell down again, and struggled in the same way; but this time they died—together, of course.

I have often asked myself the question, what could have been the mysterious tie of sympathy between those singular birds? Had they each in turn died of some fit, it would have been a common death of the bullfinch tribe; but that the fit should have seized them *all* at the same moment, in the first instance

harmlessly, and in the next with fatal results, remains a mystery to me to this day.

Talking of bullfinches and their fits, I may observe that apoplexy, their great enemy, may be averted for a long time, if not entirely, by avoiding the alderman's snare—I mean, oleaginous feeding. Let them have canary-seed as a staple, and an ample supply of *green food*—chickweed, groundsel, salads of all sorts, and fruit in the season; and *plethora* may be kept in check effectually. I would allow a grain or two of hemp-seed now and then from the master's or mistress's own fingers, but only seldom, and as rewards for good behaviour.

Is it not curious, by the way, that the teaching of these charming birds to sing tunes should be, so far as I know, left entirely in the hands of foreigners? Our own artisans ought to be as capable of instructing them as any others. The process is very simple, and consists in keeping the birds in a moderately darkened cage, and letting them hear the air whistled, or played on a small flageolet, several times each day. The high price of well-taught birds would afford a good encouragement, even if no interest was found to attach to the pursuit for itself.

A very singular fact connected with the bullfinch is, that it can, at any moment, be thrown into a state of peculiar excitement, ending in the warbling of its song, if an artificial one, by seeing the head of a person whom it knows moved gently backwards and forwards before the cage. This is very convenient for the German dealers, who generally have the birds classified according to their proficiency and firmness in their music. By this standard they regulate the prices; and when the intending customer can only give so much, they at once take a bird, and thus force him to give a 'touch of his quality,' in a room adjoining the aviary, as one may call it.

I have always thought this one of the most interesting and curious facts connected with ornithology, and I believe no rational solution of it has yet been given. It is true that authors—and in so excellent a work as the *Penny Cyclopædia* itself—have long laid it down that the effect produced upon the bird by this motion, recalls the movement of the head supposed to belong to the weaver at his work; and as it is further assumed that the weavers along the Rhine are the bird-instructors for the English market, the explanation seems easy, and hitherto has been accepted as satisfactory.

Now, were I a lawyer, I should say, 'I demur to this on three counts:' weavers do *not* make the sort of motion which affects the bullfinch; weavers are *not* exclusively the teachers of German bullfinches; and, bullfinches which never saw a weaver, and on which the experiment was not tried until long after they had learned to pipe from persons exercising no handicraft at all, have shewn themselves, to my certain knowledge, perfectly susceptible of this strange, and, as I think it, unaccountable influence.

A reason may yet be found; but that which is now popularly received has not a shadow of foundation, either in fact or theory.

It is most curious to observe the phenomenon I am now considering. When a person, known to the bird, and who does not frighten him, moves his face gently back and forward near the cage, the bird seems to be drawn gradually under the influence of a spell; he ruffles his feathers, often looking like a perfect ball; he changes his place rapidly, and utters a low, plaintive cry. After a short time spent in these preliminaries, he stops, looks attentively at the 'oscillating engine' before him, and at last swells his throat and pours forth his little melody, whatever it may be, bowing gracefully from side to side, and, as it were, keeping time with the motions of his body and tail, which latter appendage has its full share to perform on these

occasions. So far as I have heard, there is no other bird, belonging either to the old world or the new, which appears capable of being brought under this singular fascination; and with the bullfinch it is, I repeat, altogether instinctive, and independent of any particular mode of teaching or other incidental circumstance whatever.

Respecting this beautiful and engaging little bird, I may observe in passing, that vast numbers are lost by injudicious feeding when taken from the nest. So far as I have seen, milk is entirely unfit for young birds. The proper food for bullfinches is a paste made of bread steeped in water, and rape-seed, boiled till soft, and then pounded in a mortar. A little only should be prepared at a time, as sour food is always destructive. It is important to get the young birds before they become afraid of man, yet not too young to do without the warmth of the mother by night. The critical moment is when the quill feathers of the wings and tail are just beginning to grow.

Taken young, the bullfinch is the most loving and familiar of feathered pets; otherwise, it is the wildest and most untamable; and to keep it in a cage, when caught old, is mere cruelty.

From the merely agreeable of the feathered race I now turn to the useful; observing, that the differences in habits and temper between different species, or rather different varieties of the same species, are exceedingly curious. For example, the common gray partridge has, so far as I know, never bred in captivity, and its unconquerable shyness will even prevent its being domesticated: I do not think it would even go as far as the pheasant, and lay eggs in a state of confinement. There is, however, a variety of the partridge, called the 'red-legged,' a very fine bird, common in France, which will not only lay, but rear its brood even in an ordinary hutch. I have seen as many as fourteen or sixteen well-grown young birds in such circumstances; and I see no reason why this excellent sort of game should not be added to our poultry. All that is required is a small court netted over, where the birds can have 'choice of sun or shade,' and be supplied with food and water. There can be no doubt that they would be well worth rearing, and be an agreeable variety to the table. This gradation, so to speak, in the adaptability of different sorts of game—for, of course, all were *once* game—to domestication, is an interesting subject of observation.

The well-known Australian bird, the tallagalla, is gifted with an instinct which shews something like a knowledge of chemistry; it seems aware that vegetable matters, such as grass, leaves, bits of stick, &c., when heaped together, will ferment, and give out a certain degree of heat; accordingly, it makes no nest, and never incubates, as others do. It scrapes together—that is, a colony of birds will do this—a heap of the materials we have named; and in this heap the hens deposit their eggs, for the hatching of which the chickens, they wait around this natural *ecalechon* with anxious attention. Even in our climate, it would appear that this can be done, as has been proved at the gardens in the Regent's Park: but I should think it a good plan, with a view to greater increase, to remove the eggs, and place them apart, in a heap of the same materials. The young birds take long to hatch, and then come into the world fledged, and able to fly, so that their abode should be closely netted over, to prevent escape. They are, however, independent, as it would seem, of maternal solicitude; and no doubt a certain number of the birds would, according to general experience, produce a greater supply of young, if the eggs were first removed, and the gratification of the parental instinct deferred for a time.

I shall reserve for another paper a description of a simple and effective domestic incubator, which will

enable any one, at a small cost, to usher into this 'breathing world' any number of feathered fowls at his discretion. I shall only now add a few lines about that scourge of our poultry-yards, the dreaded 'gapes.'

Many causes are assigned for this destructive malady. I believe one to be almost always in fault, and that is foul water and bad food; but chiefly the first of these—foul water. I believe also that salt is the great preventive, as well as the best remedy. The disease itself is a worm in the throat of the bird; and I have no doubt that if lumps of salt are left in the way, or a little box of common salt in a convenient place, the birds will take enough of it to prevent, or cure, the malady. When they are very sick, and gaping piteously, the best thing to do is to spurt a little salt and water into their throats. Some keepers use an aromatic decoction of cinnamon, pepper, &c., a drop or two of which is put into the bird's throat, and, I have no doubt, with excellent effect. But salt is the great vermifuge of creation, so far as the land is concerned. Our instinct for it seems intended to set as a safeguard against those parasites which, if let alone, would soon be as fatal to our peace and comfort as those of old Timon of Athens were to his.

KIRKE WEBBE,

THE PRIVATEER CAPTAIN.

CHAPTER II.

Ryde, in the Isle of Wight, though not in those days the gay and flourishing place it has since become, was, thanks to its natural advantages, a favourite resort of health and pleasure seekers; and one of its chief attractions to the latter class of tourists, was undoubtedly its commanding view of the maritime life and bustle going on in the great naval arsenal of Portsmouth, and the famous roadstead of Spithead, to which the Wight forms the natural breakwater. Very exciting to the unaccustomed mind of Cockney or other inland folk must have been the frequent spectacle of captured vessels brought in with the British jack flying above the tricolor, and anchored or moored amidst the cheers and cannon-fire of the victor-crews. And albeit, to find cause of triumph in the humiliation of another, 'enemy' though he be, may not bear to be closely scanned by the light of the Gospel morality; yet how often have I seen reverently-pious eyes, seriously-pale, lengthened faces, gleam and glow with pride at such sights! At a yet later date, I am afraid, I have witnessed the same phenomena. Yet should I be the last to cast stones at others, since few could have felt fiercer joy than I did at such spectacles—my excuse being, that my parents were prisoners to the 'enemy,' which spectacles, greatly to my unreasoning regret, became less and less frequent as the maritime might of Great Britain wrestled down the giant war, as far as the ocean was concerned, and so effectually blockaded or swept the seaboard of a hostile continent, that at the commencement of 1914, months had elapsed since a captured tricolor had graced Spithead; whilst the stars and stripes, with which we had fallen out about a couple of years before, yielded but a scanty harvest.

The news, consequently, that the *Scout* privateer, Captain Webbe, had brought in a fine Yankee bark, created quite a sensation amongst us islanders; and although it was Sunday morning, the second Sunday in February, I, instead of waiting to escort my grandame to church, hurried off to Ryde Pier, where I found a small mob of excited idlers like myself.

The prize had gone into Portsmouth harbour, but the *Scout* was still anchored at Spithead—a remarkably fine brig of her class, and admirably adapted by

her long, low, sharply bowed hull, and tall raking masts, for a service in which speed was the prime requisite. She carried twelve guns of moderate calibre upon a flush deck, and had generally a complement of ninety men, maintained at a cost so onerous as to leave of late years, it was understood, a very trifling margin of profit to Captain Webbe and his owners, fortunate beyond all other 'privateers'—or pirates, writ large, as some slanderers aver that he had invariably been.

Presently a blue-peter was run up at the *Scout's* fore—a warning, it was supposed, to the boat's crew that had come on shore about an hour previously, to hasten their return to the brig, whose anchor, I noticed, had already been hove short. The warning or signal did not appear to be much heeded by the men, several of whom were smoking and sauntering about in the immediate vicinity of the pier; and when, some quarter of an hour afterwards, I took my way Ryde-ward, I came, on turning a corner in the principal street, upon a number of the *Scout* seamen, amongst whom was Captain Webbe himself, whom I knew well, from his having several times called at Oak Villa, where he was always civilly, though coldly, received by Mrs Linwood, who had known him previous to her domiciliation in the Wight.

The sailors, having just emerged from the Crown Tavern, were standing apart from Captain Webbe, who was earnestly conversing with a showily dressed, middle-aged woman, whose piercing black eyes, mallow skin, and vivacious gesticulation sufficiently declared her nationality without the aid of the few French words I indistinctly caught. She had a servant with her, also a Frenchwoman, and seemed about to take leave of the commander of the *Scout*, when his always restless glance met mine, and, scarcely to be believed, though my own eyes saw it, a crimson glow, much resembling a blush, mantled his bronzed cheeks—a swiftly passing weakness!

'Ha, Master William Linwood!' he exclaimed, extending his hand with frank cordiality, 'I am glad to see you looking so well. I intend paying Oak Villa a visit to-morrow. Mrs Linwood is, I hope, in the enjoyment of her usual fine health.'

I answered slightly, the lady's involuntary start and mounting colour having caught and fixed my attention. Recovering herself, she turned away with an assumed air of carelessness, and began chatting with her servant.

I passed on, and had not gone far, when, upon crossing the end of another street, I saw my grandame and her escort Nancy Dow coming onwards on their way to church. Not being in a devotional mood that morning, I accelerated my pace.

I had proceeded some distance, when the notion occurred to me, that as Mrs Linwood would necessarily pass Webbe and his companions, if they still remained where I had left them, I should like to witness her rencontre with the fierce-eyed Frenchwoman. I turned back to realise that whim, but had not taken fifty steps, when I halted, struck by the absurdity of my purpose. As I paused irresolutely, a clamorous burst of voices broke the stillness of the Sabbath morning, and hurrying at the top of my speed in the direction of the tumult, I could presently distinguish my grandame's voice, crying 'Help!—murder! Help!—murder!' reinforced by frantic yells of 'Fire! fire!' from Nancy Dow.

I should explain that Nancy, in consequence of having narrowly escaped being burned to death just before we left Wales, in any pressing emergency invariably shouted 'Fire! fire!' As Dr Johnson remarked of some clerical alarmists in his day, Nancy would to a certainty have cried 'Fire' at the Deluge.

I could have no doubt, therefore, as to whence the

furious outcries proceeded; but swiftly as I ran, I arrived too late. Mrs Linwood having fainted, was lying senseless, when I came up, in Captain Webbe's supporting arms, and the only other person present, except a few curious lookers-on, was Nancy Dow. The sailors and Frenchwomen had vanished.

'What is the meaning of this strange scene, Captain Webbe?' I exclaimed, at the same time relieving him of his burden.

'What is the meaning of this strange scene?' echoed Webbe. 'Ah! there, Master Linwood, you puzzle me. You can only learn that of your venerable relative; but the astounding fact is, that this impulsive, and, it would appear, most eccentric lady, no sooner caught sight of a person I was quietly conversing with, than she flew at her with perfectly feline ferocity, shouting the while "Murder! help! police!" and so on. But this is no place for talk: let me assist you to carry Mrs Linwood into the tavern; we will speak further by and by.'

Mr Beale, who lived but a few doors off, was sent for, restoratives were administered, and my grandmother revived sufficiently to murmur: 'Seize her—seize her, William: do not let her escape; she is—'

Desperately as she struggled for utterance—so desperately, that her face grew black with the effort—not another syllable could she enunciate: hysterical faintings, violent spasms followed; and Mr Beale forbade me to remain in the room, my presence appearing to greatly excite her.

Thus circumstanced, I forthwith hurried away to seek out Webbe. A few minutes sufficed to reach the pier, whence I had the mortification of seeing the *Scout* under sail, and steering for the Channel, by the eastern passage, at a spanking rate, under courses, top-sails, and top-gallant-sails. An exclamation of surprise and anger escaped me, which elicited an unexpected response.

'You are mistaken,' said a voice close to my ear. 'That rascal Webbe has not hooked it with the Frenchwoman. Pray, don't trouble yourself to apologise: those ingenuous blushes are more than sufficient excuse. The Frenchwoman,' added Webbe, 'is on board the *Scout*, and if this breeze holds, may hope to reach Guernsey before nightfall.'

'Who is the Frenchwoman? What is her name?' I demanded.

"Madame de Bonneville, Modiste," is painted in brilliant letters over her *magasin* in St Malo's, Brittany.'

'Ay, but her maiden name! Do you know that?'

'Yes; Louise Féron.'

'Louise Féron! And you, perfectly cognizant, as I am sure you are, of the cause of Mrs Linwood's excitement at meeting that woman, have connived at, aided her escape!'

'You appear, young gentleman, to strangely misunderstand our family's position relatively to Madame de Bonneville, formerly Louise Féron, who, I apprehend, can have no motive for wishing "to escape" from Mrs Linwood's surveillance. Suppose, however, we exchange this bleak pier for a cozy room at the hotel yonder, and there quietly talk over the many interesting topics suggested by this morning's encounter. I should have sought you to-morrow for substantially the same purpose, had that passage-of-arms not taken place. You will the more readily believe that,' coolly added Captain Webbe, between the puffs of his cigar—'you will the more readily believe that when I inform you, that I had the honour and pleasure of supping with your excellent mother and her husband no longer ago than Monday evening last.'

'You supped with my mother and father on Monday evening last!'

'Yes; positively so: at Numéro 12, Rue Bombardée—so named when rebuilt after its demolition by *les perfides Anglais* a few years since—Havre de Grace, Département of the Seine Inférieure. They are both well—that is to say, as well as under existing circumstances could be reasonably expected.'

'This must be a sorry jest!' I angrily exclaimed; 'or if not, permit me to ask what conceivable motive could have induced *Scout* Webbe to trust himself in a French garrison town, from which escape is proverbially next to impossible?'

'To which sagacious query "*Scout* Webbe" can only reply by remarking, after the ancients, that the silliest child might ask the wisest man more questions in five minutes than he could answer in five hundred years—did wise men live so long, which, from regard for you, I could wish were the case. Gad! Linwood, what an explosive fellow you are! You cannot surely suppose I used the words "silliest child" or "wisest man" in a sense personal to you?'

'I do not care a button in what sense, or no sense, you used them! All I have to say is, that there are some topics upon which I do not bear jesting, and I will thank you to avoid them.'

'That is quite right and spirited,' rejoined Webbe, 'though prompted by a misapprehension, as I certainly do not jest in saying I passed last Monday evening with your parents in Havre de Grace. This I undertake to prove to you, directly I have taken the chill off my stomach with a glass of hot, stiff grog.'

We entered the hotel, were shewn into a private room; and Webbe, secretly enjoying, I was sure, the suspense in which he kept me, quite as much as the hot brandy and water he leisurely sipped—a stimulant which he politely regretted my immature palate prevented me from participating at that hour of the day—wrapped himself up in a real or simulated meditative reverie for some ten minutes, during which I had an opportunity of closely observing one of, in several respects, the most remarkable men of his day.

My impression of the man, as depicted in my notebook on the day after my first important interview with him, the general truth of which many now living will recognise, may be thus roughly rendered:

'Kirke Webbe, now approaching, I should say, to fifty years of age, is of medium height—say, five feet seven or eight—not stout, but broad shouldered and of sinewy frame, upon which years have as yet placed no appreciable weight. Of fair complexion originally, but now bronzed by sun and service, he is nearly bald; and what hair he has is of a light colour; as are his whiskers, except that in certain lights they seem to have a curious green tinge. There is a slight cast to his keen, restless gray eyes; and the strong lines about his mouth confirm and strengthen the predominant character of his physiognomy, which is that of a man possessed of a calm, courageous, indomitable will, neither debased by ferocity, nor accessible to the influences of a chivalric or disinterested purpose. In dress and speech, Captain Webbe affects the landman and gentleman, and to a casual observer, would accurately present a more vivid idea of a seaman than night at the Royal Yacht Club captain of his own yacht.'

As I have before remarked, the privateer captain had received a superior education; and his French accent, M. Laborde, an *émigré* of whom I learned that language, asserted to be perfect—that of a Frenchman born.

I was still engaged in the not over-satisfactory perusal of Mr Webbe's physiognomical indices, when he, taking a carefully preserved note from his pocket-book, tossed it towards me, saying: 'You have not seen that before, I think?'

It was a highly complimentary note from Mr Secretary Croker, addressed to the captain of the audacious and fortunate *Scout*, and expressed a polite

regret that so much enterprise and valour had not found a more fitting arena for their display in the king's regular service.

Captain Webbe was, I knew, extremely proud of Mr Wilson Croker's semi-official recognition of his services; which, if a forgery, as some asserted—an uncharitable hypothesis, but quite within the range of possibility—was, I may remark in passing, exceedingly well executed, both in the imitation of the secretary's handwriting, with which I happened to be acquainted, and the official seal.

I returned the precious document with a few civil words of course; Captain Webbe replaced it in his pocket-book, and drew therefrom a sealed letter.

'You doubted,' said he, 'that I passed last Monday evening with your captive relatives in Havre de Grace. This letter will remove that doubt. Do you recognise,' added Webbe—'do you recognise the hand which traced this direction to Mr William Linwood?'

'My mother's!' I exclaimed, starting up, and rudely snatching the letter. It was the first I had ever received from her; and with uncontrollable emotion, relieved by the scalding tears which fell upon the paper, I, after many efforts, read it to the end.

'MY BELOVED CHILD! for child you are still to me, as when, ten sad weary years ago, you were awakened to receive your mother's yearning, last embrace. I cannot as yet, my darling boy, realise you to be the fine tall youth—tall as your suffering, persecuted father—described by Captain Webbe; but the blessed time will come when, strained in these clasping arms, my heart shall recognise in the manlike son, the developed, matured promise of the child of memory—yes, and that it will come speedily, I have a lively hope and faith. It is now almost openly said even here, that the power of the French emperor, but a brief time since, so colossal, seemingly unassailable, was irremediably shattered by the Russian campaign—an afflictive yet merciful visitation of a just God, which gives assurance that the woful days of captivity are numbered. But alas, my son! the restoration of peace to Europe will not bring peace to your father's bruised and fainting spirit; nor to mine, which is inseparable from his. My son runs on, dear boy, as if addressing one acquainted with the nature of the burden beneath which we have so many years hopelessly languished. The sad story will be related to you by Captain Webbe; and you will, at the same time, hear from him that circumstances have recently come to his knowledge, through which, with your aid, he may be enabled to restore our father to society—to cheerful, healthy life! God grant that it prove so! And whatever may be said of Webbe, he cannot be accused of idle boasting. What be circumstances are, or how your assistance, dear child, should be so absolutely necessary to the success of his design, he declined to say, and I feared to press him for his grounds of hope. He assured me again and again that you would incur no serious peril; but what say such a fearless man esteem to be serious peril? I must break off, for Captain Webbe waits only for this letter to be gone; and but a brief delay in the perilous position wherein, for the purpose of conferring freely with us, he has placed himself, might compromise his safety. With fear and trembling, now that this letter in a few minutes have passed from me beyond recall, I commend you, my beloved, my only son, to a enterprise in which your mother can only aid you with her blessing and her prayers.

EMILY LINWOOD.'

I thrust the letter into my pocket, and, turning from the window, resealed myself at the table.

'Take a sup of brandy and water,' said Captain Webbe, pushing his glass towards me; 'it will do you good. Never care to hide your tears. I should have poor opinion of the spirit of a youth whom such a

letter, as I suppose that to be from a long-absent mother, did not affect to tears. You are quite resolved, I see, to go with me in this matter?'

'To the death!'

'Yes, I know, but we'll contrive, if possible, to cast anchor on this side of that mooring-ground: it is always, however, well to look the worst that can happen boldly in the face; it tends to prevent flurry when the worst presents itself, and steadiness of nerve is indispensable.'

'The letter intimates that you will inform me of all the circumstances which led to, or may throw light upon, my father's unfortunate position.'

'I am quite ready to do so, but you must say grace first.'

'Say grace first! What do you mean?'

'Frankly this: If you are the lad of metal I have represented you to be, we are about to initiate a difficult enterprise, in which I, moved by various considerations—an old regard for your oppressed, broken-spirited father—a love of counterplot, if only for the excitement and mischief of the thing—and, to be quite candid, the promise by your mother of a substantial reward in the event of success—have determined to engage.'

'I understand all that; and you but dally with my impatience.'

'Steady—steady, my fine lad! It is never wise to spread too much sail, fair as the wind, and fine as the weather may be. That enterprise, I was about to say, to which any son who had a heart in his bosom would not hesitate to devote himself body and soul, will necessarily bring you acquainted with certain business secrets of mine, which I must have a solemn guarantee from you shall never, under any circumstances, be made known to my prejudice.'

'What guarantee can I give?'

'That of your sacred word and honour.'

'It is given already.'

'You declare solemnly that, happen what will, you will never make known to my injury or prejudice any fact concerning me, or my transactions, which may by any chance become known to you.'

'I do solemnly make that declaration—bind myself by that promise.'

'As you shall answer to God at the last great day!'

'As I shall answer to God at the last great day!'

'Enough! Now, then, to business.'

THE PEOPLE AT SARAWAK.

THE inhabitants of Sarawak are of three different races—Dyaks, Malays, and Chinese. The Dyaks are the aborigines of the island; the Malays, a seafaring race who have settled on the coast, and have to a considerable extent compelled the Dyaks to retire inland; and the Chinese are immigrants who have settled in the country, and form a distinct community in the midst of either the Malays or Dyaks, as chance may have placed them. The Malays and Chinese are so well known, that I shall say little concerning them, but shall merely reproduce a parallel which I have sometimes mentally drawn between these two races on the one hand, and the Scottish Highlanders and Lowlanders on the other.

The Chinese, like the Lowland Scotch, are cautious, clear-headed, persevering, industrious, and frugal without being niggardly. They lay hold of every opportunity of bettering their circumstances, turn everything to account, and stick all together. They have a keen relish for the humorous, are very hospitable, and excessively proud—proud of themselves and their attainments, proud of their country and its greatness, reckoning themselves the first people, and it the first nation by many degrees on the face of

the earth. They emigrate in great numbers to all the countries with which they are acquainted; and though they strive to return to their own land with a competence, they generally settle permanently abroad. So far, I think, the characters of the two nations run parallel; but beyond this point the comparison turns into a contrast. The Chinese are utterly unprincipled and mendacious, and thoroughly selfish; and, though many of them know that 'honesty is the best policy,' it may be safely said that they are never honest from high principle.

The Malays, on the other hand, are proud, hot-blooded, and revengeful; expert in the use of arms, fond of war, and averse to work; fierce and ferocious when excited, but polite and gentlemanly in their ordinary conduct, always civil, and often obliging. They are very fond of their children—so fond, that they never correct them; and the indulgence with which they are treated when young, is probably one cause of the high sense of personal dignity which they possess, and why they so deeply feel anything like slight or insult. If they quarrel, they never apply abusive epithets to each other, like Chinese or Hindoos; they are too proud to scold, and their resentment is too deep to be vented in words. They are not exactly brave, in our sense of the word; that is, they have not the cool calm courage of western nations, at least of disciplined men; but when their blood is roused, they lose all regard for personal consequences, and fight like furies to the death. 'You must surely give your men something to inspire courage,' said a Malay who witnessed Keppell's attack on Patuan to one of the Europeans, 'for they rush up right in face of the cannons. Now we Malays are brave, but we cannot do that.' Yet this man bears a high character for courage, and was the first to scale the enemy's palisade at Sungè Lang (Kite's River), preceding even Europeans in the attack.

The Dyaks are a branch of the Malay race, and differ little from the ordinary Malay type. They have broad faces, flat noses, thickish lips, black eyes, and coarse lank black hair. They are fairer than the Malays, some of them when young being as fair as a European; but as they grow up and expose themselves to the sun, they become of a reddish brown, like the savages of the Amazon, whom, I have been told, they much resemble in many respects. They are smaller, and possess less physical strength than Europeans, but they have great powers of endurance, and great bodily activity, climbing rocks and trees like cats or monkeys. Their countenance is, as I have said, of the Malay type, and it consequently takes some time before a European becomes accustomed to their appearance; but when his eye has been reconciled to their cast of features, he soon discovers in them intelligence, openness, sprightliness, and good-humour. These qualities never fail to commend themselves to the favourable consideration of the spectator, and he soon begins to consider them handsome, according as they approach the ideal of the Malay type, just as he considers a European handsome, according as he approaches the ideal of the Caucasian type. The ordinary dress of the men consists of a *chawat*, or piece of cloth, about six inches wide, and six or eight feet long, passed once between the legs, and wrapped several times round the waist, one end of it hanging down in front, the other behind. They also wear a jacket of thick cotton cloth of their own manufacture, and a handkerchief or piece of bark-cloth tied like a turban around the head. The women wear a petticoat of much scantier dimensions than a Highlander's kilt, together with a jacket like that of the men. Few of either sex, however, wear the jacket, except in cold weather; the men, if on a journey, generally carrying theirs in a basket, while the women hang theirs over one shoulder. Many men wear their hair long like

the women, but most of them wear it short, while a few shave the head completely bare. Both sexes are fond of adorning their hair or head-dresses with flowers, generally large bright red and yellow blossoms, which become their dark complexions exceedingly well.

Of national ornaments, as they may be called, there are no great variety, and most of them, though still retained by the inland tribes, are being abandoned by those who have come much in contact with Europeans. The most striking to the eye of a stranger are the large and numerous ear-rings worn by the tribes of Sarebas and Sakarran, and which are inserted not only in the lobe, but also in the cartilage of the ear. Five or six large brass rings—the largest being sometimes four inches in diameter—are suspended in the lobe of the ear, and eight or ten more in regularly diminishing order as they ascend, are inserted in the cartilage. The women do not wear these enormous ear-rings, their peculiar ornament being a circlet of painted rattan hoops around the waist. Both sexes wear numerous bracelets and anklets of brass-wire, and frequently also armlets of polished white shell, which contrast well with their dusky forms. On one occasion, I saw the daughters of several Sakarran chiefs clothed in loose dresses composed of shells, beads, and polished stones, arranged with great care and considerable taste. The dress, which was very becoming, hung as low as the knee, and as the young ladies walked along, the stones of which it was composed rung upon each other like the chime of distant bells. These dresses are very expensive, costing some seventy or eighty reala apiece (about L.12), and are therefore not common.

Some of the young men wear head-dresses composed of the hair of their enemies, dyed red, with which they also ornament the heads of their spears and the handles and scabbards of their swords. Others adorn themselves with the feathers of the argus pheasant, and many with fantastic artificial plumes. At Sumpu, I saw a woman wearing a long round hat, somewhat resembling the head-dress of a Parsee, but narrower, and much more lofty. The Malos and Kynes tattoo themselves slightly, and generally each tribe has some trifling distinction in dress or ornament peculiar to themselves.

In disposition, the Dyaks are mild and gentle; they are quiet and docile when well treated, but proud and apt to take offence if they think themselves slighted. They are industrious, frugal, and accumulative, and were they not so poor, might even be reckoned stingy; but as each knows that, if from the failure of his crop, or from any other unavoidable cause, he should fall into debt, it will accumulate so rapidly, from the high rate of interest, that he will probably never get free from it, the carefulness and frugality which they display cannot be regarded otherwise than as being legitimate. At the same time, they are hospitable to the extent of their means, and consider themselves bound to place before a visitor the best they can afford. They have a strong perception of the distinction between *meum* and *tuum*, and scarcely ever violate it either among themselves or towards Europeans. They never attempt such thefts and robberies as the South sea islanders were in the habit of committing upon the early navigators; for their great self-esteem, and high sense of personal and family dignity, and the intense keenness with which they feel anything like degradation, would alone prevent their doing anything to which infamy was attached. As they are so honest, so are they to a great extent truthful, and to this general character there are of course exceptions. On one occasion, a Dyak said to a missionary: 'Your religion is for sinners, is it not?' 'Yes,' he replied. 'It is for all men to teach them to be good, and to do God's will.' 'Very well,' was the answer; 'you should try and convert that man,' pointing to one who passed

by, 'for he is a thief.' But though the Dyaks do not steal, they are great beggars; for they have been so accustomed to receive things from white men, that they think they have only to ask for anything they may want. Their pride, however, is so great, that a few rebuffs effectually check them; and they have, besides, a delicacy of feeling, and an innate sense of the becoming, which prevent their doing anything improper or contrary to natural good manners. When they receive a present, they never say 'Thank you,' but next day they will bring in return a little fruit or some such trifle: it is their method of making an acknowledgment.

When young, the Dyaks are acute and apt to learn, but as they grow older, their intellect seems to become deadened, and incapable of rising beyond familiar subjects. The cause of this seems to be, that having neither religion nor poetry, having nothing that can elevate the mind above the routine of ordinary life, or cause the past, the distant, or the future to predominate over the present, their faculties are bowed down to the daily wants of their daily existence, and become incapable of expanding beyond them. I have observed that those lads who are in the habit of associating with the missionaries, and have been by them instructed in Christianity, are much more acute and intelligent than their companions; and I think it not unlikely that they may retain through life that mental superiority which they now unquestionably possess. Let us hope, then, that Christianity, which has done so much for every other nation by whom it has been received, will do as much for them, and that they will be elevated both morally and intellectually by being taught the sublime and affecting narrative of the Saviour's life and death.

There are in the Sarawak territory many different tribes of Dyaks, named from the rivers on which they live, many of them speaking distinct languages, and almost all of them habitually regarding each other as enemies. These tribes, prior to the coming of Sir James Brooke, lived in a state of chronic hostility with each other; whenever they met, they fought. They either fitted out numerous fleets to combat on a large scale, or they went out in small parties of one or two boats, stealing upon their enemies by surprise, and retreating as suddenly as they came. The object of all these expeditions was to procure human heads. The head of an enemy is the most valued prize a Dyak can have, and is not only esteemed as a trophy of valour, but is also intimately connected with their superstitious customs. The death of one of their tribe entailed an *ulat* or ban upon the whole country; and until this *ulat* was removed, which it only could be by the capture of a head, various restrictions were placed upon the whole community—for example, no widower could marry again, nor could the appropriate offerings at the tombs of their deceased relatives be made till the *ulat* was removed. There were therefore many excuses for head-hunting. If the near relative of a chief died, he immediately organised a head-hunting expedition, believing the heads captured probably, though now unconsciously, as an offering to the manes of the deceased. At other times, they went out to avenge former attacks by hostile tribes, and often, again, merely for the love of war and the glory of taking heads. Nor were they at all particular whose head they took. Primarily, of course, their expeditions were directed against enemies; but with them, every stranger was an enemy; and a disappointed war-party would sooner take the head of a friend, than return without one. Thus head-hunting became with them a passion; and thus palmy days, before it was so much put down by Sir James Brooke, a young man could scarcely get married before he had taken a head. If they fitted out a large fleet of war-boats, they would swiftly and silently

approach a village, surround it at night, or rather just before morning, set fire to the houses, and massacre indiscriminately men, women, and children, and then depart in triumph with their heads; or if a small war-party of six or seven men embarked in a fast boat, they would conceal it in the umbrageous creeks near an enemy's house, and then prowling about in the jungle, would pounce upon any unfortunate who might stray near them. Sometimes they would even get into the wells of their enemies, and, covering their heads with a few leaves, sit for hours in the water waiting for a victim. Then when any woman or girl came to draw water, they would rush out upon her, cut her down, take her head, and flee into the jungle with it before any alarm could be given. Sometimes a war-party would decoy a party of traders, and murder them for the sake of their heads; while a trading-party, if opportunity offered, never failed to act in a similar manner. Thus no party of Dyaks was ever safe from any other party: they lived, as I said before, in a state of chronic hostility with all their neighbours, attacking and being attacked by all around them.

This was the general state of Dyak society before the coming of Sir James Brooke; but there are two tribes who, from the atrocities they perpetrated, from the extent of country they devastated, and from the attacks to which Sir James Brooke was subjected, for having broken their power, merit a peculiar notice. These are the Dyaks of Sarebas and Sakarran.

These tribes were more numerous, more powerful, and better organised for purposes of aggression than any of the others, being to a considerable extent under the authority of Malay chiefs, who employed the head-hunting propensities of the Dyaks to further their own piratical inclinations. They would call out a fleet of 100 or 200 war-boats—each containing on an average about thirty-five men—and with this formidable force they would plunder and devastate the whole coast from Pontianak to Barram, a distance of 400 miles. Villages were surrounded and whole tribes cut off. Many communities were broken up, and their families forced to flee, some to more powerful tribes, others to remote fastnesses and distant countries. Men at their fishing-stakes, and women and children in their rice-fields, were surprised and murdered, and the country was fast becoming depopulated and desert. These fleets were led by the Malays, who appropriated the plunder that was captured, while the Dyaks received what they prized most—the heads. Of these bloody trophies, great numbers were taken, sometimes as many as 400 in a single expedition. Nor did they confine their attacks to other Dyaks against whom it might be supposed they had cause of war: they fell upon all who had either plunder to gratify the Malays, or heads to satisfy themselves. All whom they met they attacked, Dyaks, Malays, Chinese, and Europeans; villages ashore, or vessels afloat, all were equally subject to their indiscriminate ravages. To put a stop to these ravages, and to break their aggressive power, was the first step towards the pacification of the country; a step as absolutely indispensable as would be the destruction of a den of tigers in the vicinity of an Indian village. No other tribe could cultivate the arts of peace, or do anything else than prepare for war, when liable to be attacked any day or night by the men of Sarebas and Sakarran.

Such were the tribes whom Sir James Brooke attacked, and whose power he broke; and it was on account of the severe chastisement which he inflicted upon them that he was branded in this country as a mercenary and blood-thirsty murderer. Fortunately for the interests of humanity, he was not deterred by the attacks made upon him from pursuing the line of conduct he had marked out for himself; but after having effectually broken the aggressive

power of the Dyaks, he took measures to pacify the country and to give security to life and property. This he has succeeded to a great extent in doing, and the consequences have been most gratifying, and almost wonderful. The late outbreak of the Chinese has of course given a shock to the prosperity of the settlement, and probably thrown it back about three years; but I am sure it will not really injure it, though I can only speak of the country as I saw it last year. At that period, people from neighbouring districts had flocked, and were flocking, into Sir James's territory to enjoy the benefits of his government; the resources of the country were being rapidly developed; trade had increased, and was increasing, to an astonishing extent; tribes of savages whose only delight was in bloodshed, and who regarded the possession of a human head as the *summum bonum*, have to a great extent been turned from their bloody courses, and taught to devote their superfluous energies to the increased production of the fruits of the earth. Larger breadths of land are being brought into cultivation, yet all the crops are consumed in the country, and it is necessary often to import rice for the increasing population. Pepper and gambier, and many other crops, are being introduced; sago is largely produced and manufactured; mines are wrought, and smelting establishments erected; gold is found in tolerable quantities, and antimony, and above all, coal will soon be wrought on a large scale. In short, Sarawak has become the emporium of trade and the centre of civilisation to the whole north-west coast of Borneo, and so far as man can presume to look into the future, Sir James Brooke seems there to have laid the foundation of a great, and, let us hope, a durable and Christian empire. This has he done, and thus has he earned for himself a place in the noble list of the benefactors of mankind, while in the government of his principality he has displayed a tact and an ability that have extorted the commendation even of his enemies. He is one of her sons of whom England may well be proud, one who in his lesser sphere has exhibited a courage and a capacity not unworthy of a Clive or a Hastings, united to a purer if a less brilliant fame.

HOW TO EAT WISELY.

Dr Hall, in his journal, gives the following advice: '1. Never sit down to a table with an anxious or disturbed mind; better a hundredfold intermit that meal, for there will then be that much more food in the world for hungrier stomachs than yours; and besides, eating under such circumstances can only, and will always, prolong and aggravate the condition of things. 2. Never sit down to a meal after any intense mental effort, for physical and mental injury are inevitable, and no man has a right to deliberately injure body, mind, or estate. 3. Never go to a full table during bodily exhaustion—designated by some as being worn out, tired to death, used up, done over, and the like. The wisest thing you can do under such circumstances is to take a cracker and a cup of warm tea, either black or green, and no more. In ten minutes you will feel a degree of refreshment and liveliness which will be pleasantly surprising to you; not of the transient kind which a glass of liquor affords, but permanent; for the tea gives present stimulus and a little strength, and before it subsides, nutriment begins to be drawn from the sugar and cream, and bread, thus allowing the body gradually, and by safe degrees, to regain its usual vigour. Then, in a couple of hours, you may take a full meal, provided it does not bring it later than two hours before sundown; if later, then take nothing for that day in addition to the cracker and tea, and the next day you will feel a freshness and vigour not recently known.' No reader will require to be advised a second time who will make a trial as above, whilst it is a fact of no unusual observation among intelligent physicians, that eating heartily, and under bodily exhaustion, is not unfrequently the cause of

alarming and painful illness, and sometimes sudden death. These things being so, let every family make it a point to assemble around the family board with kindly feelings, with a cheerful humour and a courteous spirit; and let that member of it be sent from it in disgrace who presumes to mar the ought-to-be blest reunion, by sullen silence, or impatient look, or angry tone, or complaining tongue. Eat in thankful gladness, or away with you to the kitchen, you graceless churl, you ungrateful pestilent lout that you are!—There was grand and good philosophy in the old-time custom of having a buffoon or music at the dinner-table.

ONE TRUE HEART IS MINE.

I WILL not murmur at my lot,
Or deem it aught but good,
Though I must toil with head and hands
To earn my daily food.
I will not fret though Fortune frown,
Or at stern fate repine;
Since I can say—O Heaven, what joy—
That one true heart is mine!

The gay may cast their looks of scorn
Upon my humble garb;
Such looks give wounds to some—for me,
They bear nor point nor barb;
I've hidden armour o'er my breast,
That seems almost divine;
No sneer can scathe, while I have power
To say: One heart is mine.

The rich may boast his golden store—
I envy none mere pelf;
But when I see it, I can smile,
And whisper to myself:
'Oh, joy of joys, how rich am I!
Without such wealth as thine;
God prosper thee, and give beside
Such a true heart as mine.'

Now we must wait, that one and I,
And work to earn a home,
Where hands as well as hearts may join;
But the good time will come;
And though the waiting may be long,
Why should I sigh or pine?
Doubt, fear, away! for I can say
That one true heart is mine.

Grimsby.

RUTH BOCK.

PAY OF MINISTERS OF THE CROWN.

An article in the last number of the *Journal of the Statistical Society* treats of this subject in a way that will be new to many. The principal ministers of state who enjoy incomes equal to that of the highest class of professional men. A successful barrister, for instance, makes a large income by the time he arrives at middle life; the bench is then ready to receive the judge; and when the powers of the judge fail, he may retire on a pension of L.3500 or L.5000 a year. A cabinet minister, on the other hand—with the exception of the Lord Chancellor—has a most precarious income of from L.2000 to L.5000 a year, during his uncertain tenure of office, and then retires upon a pension ranging from L.1000 to L.2000 a year.

SATURDAY, AUGUST 15, 1857.

PRICE 1½d.

WHAT ONE LEARNS IN THE WORLD.

THERE is a good deal of spurious knowledge of the world. A crafty, manoeuvring kind of personage may frequently be met with, whose half-closed eyes twinkle with astuteness and suspicion. He will sometimes, in a confidential mood, take you by the button-hole, and assert, with a mysterious modulation of his voice, that he knows the world. The probability is, that he imparts this interesting fact in consequence of your having dropped some remark in which you gave some one credit for common honesty and uprightness of intention, or advocated a fair, straightforward line of conduct. If you should unfortunately have business relations with a 'party' of this stamp—I fancy the word 'party' was first used in this odious sense by some Mr Worldly Wiseman—he will be found a sharp practitioner in matters of traffic, barter, and exchange. In case you wish to make a purchase, he will perhaps exhibit a coarse sort of skill in tickling your vanity and self-esteem. The little foibles of your character will be tenderly propitiated. If you are fond of outspeaking candour, the cunning bargainer will play the 'downright' inimitably. If your nature contains an element of Indian gravity, and you like a palaver, he will be loquacious on things in general with a particular view to commercial morality, and deliver a succession of texts for as many homilies. When the preliminary negotiations have been duly completed, your sympathising friend will wind up by asking fifty per cent. more than the price he would be willing to take, and will thus place you in the disadvantageous position of a beater-down—a haggler. Wearied and disgusted, you are glad to terminate the transaction by splitting the difference. The vender gets 25 per cent. more than a fair price, and goes away pleasantly simpering; and you, the vendee, think yourself fortunate in getting a reduction on the asked price, and a lesson in knowledge of the world—*great emptor.*

But I beg the reader's pardon for supposing, even momentarily, that he can believe this sort of low cunning to be genuine knowledge of the world. It is the knowledge of an unluckily large class in the world, and, such as it is, is easily picked up, and scarcely worth acquiring.

If knowledge of the world makes men perfidious,
May Juba ever live in ignorance!

Nevertheless, there is a worldly wisdom which is extremely valuable, and must be learned by every prudent man, regardless of any cost but degradation. Persons whose manner of life is secluded and contem-

plative, are apt to form ideals, making a very pretty show in reverie, but as totally unfit for practical use and guidance as the paper constitutions of Abbé Sièyes. Social life, like the glorious British constitution, is a system of balancings, compensations, and patchwork. If the greatest intellects, from Plato downwards, have failed to contrive a perfect commonwealth, how can we expect to imagine, much less to realise, perfect social relations between man and man? It is our wisest plan to make the best of society as it is, and reform it as we can. To this end it is necessary to win knowledge of the world, and take care how we use it, bearing in mind that there is another knowledge, spiritual and divine, with which we must also take counsel, and the veto of which we must respect.

Now, let us think of one or two things which the freshman will learn in the school of experience.

It is a good old custom in some Elizabethan foundations, to bump new-comers. The unwary youth entering the playground, and contemplating his future school-mates with mingled feelings of awe, interest, and curiosity, is suddenly seized by some half-dozen all at once. Two lusty lads are told off to his head and shoulders, two to each leg, and he is hurried off to a venerable tree-stump, smooth and polished by the frequent ceremony, and there he is bumped—not faintly, in make-believe fashion, but soundly bumped. Now, a school is a microcosm, and I believe we may anticipate a great deal of what we have to endure in the world by inference from school-experience. I apprehend the ceremony above mentioned has two principal aims—namely, the measurement and gauging of pluck and spirit, and the reduction of self-importance. In like manner, on entering the world—that is, on passing from the partial and indulgent little home-circle to the mart, the pulpit, or the forum—a youth generally finds that certain initiatory ordeals must be submitted to. He will learn amongst his first scraps of knowledge of the world, that he must endure considerable curtailment of his self-conceit. Political theorists lay down that each citizen must yield up a portion of his liberty, for the more secure enjoyment of the remainder. In like manner, a man must give up in private life a part of his self-conceit, or else it will all be knocked out of him rather roughly. One of the advantages—among many disadvantages—of public schools I take to be, that a very good elementary lesson on this point is derivable from companionship. Boys, like men, find their level, and learn to know their position, rights, and duties, by being thrown into a multitude, and left to fight it out. An old essayist has with partial truth remarked that the shyness and reserve so noticeable

in those of a studious and meditative turn, is as often the result of self-conceit as of humility. Generally, both causes operate. Commerce with the world will remove or modify at once the causes and effect. Humility before God in the presence of eternal truth and the contemplation of spiritual holiness, is one of the best virtues of the human heart. Humility before man is but a species of abjectness, not always quite contemptible, but still a lamentable blemish. Possibly the world is but giving a beneficial lesson when it ruthlessly over-rides the prostrate soul. If experience of life teaches anything, it teaches self-reliance, and self-reliance implies self-respect. Newton compared himself to a child picking up on the ocean-shore of truth a few prettier pebbles than the rest. That was humility of the right sort. The great philosopher did not compare himself to a child amongst men, for he knew his gifts. Nothing can be more incorrect than to suppose that because a man of ability is conscious of his power, he is necessarily self-conceited. One who underrates his mental or physical endowments, is but unthankfully humble. Nor does the world exact this, but only that he recollect he is a member of a community of individuals possessing rights and feelings similar to his own, and demean himself accordingly. Let him respect his fellows, and they will respect him. He must not attempt to raise himself by depressing others, denying their merits, humbling their little pomposities, rudely exposing their harmless foibles, and concealing or justifying his own. If he is exalted by such means, the world will be against him. I think that men of letters of former days had themselves to blame in great measure for their somewhat ungenial reception by the public. They were too fond of contemning the ordinary pursuits and ambitions of mankind, and seemed to imagine that all wisdom could be put up in type, wherein they were mightily mistaken.

By the time Dame Experience has taught our novice to know his place, it is likely that a great many angularities of his character will be worn down. During the process of abrasure, he will have experienced some inconvenience and annoyance; but it will not be the worse for him in the end. The curry-comb may be a little unpleasant to Bucephalus, a steed of mettle, but his coat will be all the more sleek and shining for its use. It is not necessary or proper to yield up all individuality of character. Mankind are not intended to be rubbed together till their characters are rounded and uniform, like a box of shot, as some one says.

So far our friend will have been principally engaged in learning his relation to society. Another department of knowledge of the world which he must learn is the relation of others to him, and to one another. He will read a variety of characters, and see the working of complex passions, instincts, and aspirations; he will grow expert in interpreting motives by actions, and guiding his own conduct accordingly. Unless he is placed in peculiar circumstances, it will be forcibly impressed upon him that, what are called the institutions, customs, and etiquette of society, are not to be lightly set at naught. I daresay he will set out with an intense hatred and contempt of shams; probably he will begin by indiscriminate denunciation and persistent avoidance of everything which seems otherwise than it is. But in time it will be found expedient to divide shams into two classes—the excusable, and the inexcusable—the latter, all noble instincts will combine to condemn; the former, it will be best, morally and socially, to yield to. We must not always proclaim the whole truth within us on the house-tops, albeit our soul disdains a lie; it will not do always to let a person know our estimate of him: one has to be polite to fools and knaves.

There is a net-work of social formalism curiously

contrived, and in which a social being feels himself uncomfortably entangled. He exclaims with the laureate:

Cursed be the sickly forms that err from honest nature's rule!

But let him take care to conform. I think, on reflection, a certain philosophical reasonableness may be discerned in some of them. It is very well to attempt to reform social institutions, to soften down 'social tyrannies,' but the advantage of refusing allegiance to them point-blank, is greatly outbalanced by the disadvantage. In all probability, for one kindred spirit that hails the brave innovator, a dozen reasonable and pleasant friends will be lost to him. Society has with one accord pronounced that, on some occasions, it is befitting to seem pleased when one is not pleased; to keep down at the bottom of the heart personal misery, and wear a cheerful mask; to withhold your real sentiments, and substitute evasive commonplaces. One can easily, of course, admit that in extreme circumstances, or when a selfish motive prevails, this sort of behaviour is little less than hypocrisy; yet all these things must be done on some occasions; and where to draw the line, must be left to individual discretion. 'But it is not sufficient,' says that acute and rigid moralist Pascal, 'that we state only what is the truth; we are bound also not, at all times, to say all that is true; because we ought only to give publicity to things that may serve a useful purpose, and not to such as may cause pain to individuals without conducing to general utility.' This, of course, applies to the conduct of life, as well as of an argument. You meet, we will say, an acquaintance, whose conversation is the reverse of acceptable—in short, he is a bore—nevertheless, the world enjoins you to receive him pleasantly, and get rid of him with gentleness. You are thrown, suppose, into a cheerful society engaged in 'pleasance,' as the old writers have it; a grief is gnawing at your heart; nevertheless, you grin down your sighs, and do as little as may be to remind your companions that man is born to trouble. A friend introduces you to a stranger; you find him, on acquaintance, coarse, vain, and frivolous—briefly, a Goth. Some time after, your friend casually, and rather imprudently, asks you what you think of your new acquaintance; are you at once to proclaim that you consider him a Goth? It may happen that a friend of your family feels it a duty to take notice of you, and invites you to a Sunday dinner; you had Sunday dinners, except at home, and don't much relish being taken notice of patronisingly; nevertheless, you cannot well say so, and therefore you go, and pass yourself to be entertaining.

These crampings of the soul are no doubt unpleasant, yet I think I see in them something which gives them a kind of dignity. By men in business especially, a due regard to the exigencies of conventionalism must be paid. In the private circle, a man's character becomes well known, and allowance is often made for idiosyncrasies; but in business, the intercourse with his fellows is so limited, that no interest arises sufficient to counterbalance *prima facie* disagreeableness. Men in professions and trade therefore find it necessary to court the good-will of others by strict attention to their feelings, carefully avoiding snappish places, and keeping their esoteric opinions to themselves. There are a class of persons, however, who make a point of speaking their minds, as they term it. Generally, these individuals lash the vices of the age and the crotchets of their neighbours with such a gusto, that one cannot help believing the genius of ill-feeling, and not enlightened satire, prompts their diatribes. They imagine themselves to be bravely independent, when they are only brusque. Of course, it must be admitted that many conventionalisms are

nuisances, but not all. We are a little too apt to rebel against harmless, nay, beneficial formalism. What do we observe in descending the scale of society? Do we not find that feelings are ruffled by frequent and gross personalities? Wit, humour, moral counsel, and intellectual discussion—all become personal. You find practical jokers in abundance, open mockery of personal defects, merriment at personal annoyances. Impudence is the only safeguard. Men vex one another with a relish. Friendship loses its delicate flavour, and even virtuous love is deprived of much of its refinement. For my part, I esteem social tyrannies better than social anarchy. Let us be patient. If need be, agitate constitutionally in the social parliament, and bring in a social reform bill; but in the meantime we must respect, so far as conscience will permit, the powers that be—pay morning calls, talk idle-tattle at tea-tables, discourse vigorously on things indifferent, smile when we are ennuied, and be thankful to the man who introduced the weather as a neutral ground of converse. In short, we must indulge in a little innocent conformity, until we can emigrate to arcadian groves and utopian cities, or dwell in them at home, or cease to be gregarious. I have said that there seems to be a certain reasonableness in social forms; they may be regarded as so many fences artificially raised to protect us from rude collision with the prejudices and self-esteem of others. Many, no doubt, have almost survived their usefulness, and at least have become so stiff and antiquated as to excite ridicule and occasion annoyance; but in default of a revised code, they can hardly be dispensed with. All men were equally refined and considerate, the proprieties of life would suggest themselves spontaneously. There is always a class of people, however, who are guided more correctly by external regulations than by innate sensibilities; and there is always another class ready to attach too much importance to rigid etiquette, and live according to the letter rather than the spirit of the law. These are the people who convert wholesome rules into tyrannical restraints, and hinder social pleasures by the very means intended to enhance them.

Although it is perhaps expedient to fall in with the manners and customs we find existing around us, we must not infer that it is inexpedient to enter a protest now and then against any portion of the shoe that chafes unduly. It is a Briton's privilege to grumble. After all, how have we gained our political liberties but by grumbling; and it may be that our social liberties shall be gained and protected by a similar process. Her Majesty's Opposition is an embodied grumble. By all means, let the principle be extended to the realm of social conventionalism.

'THE FIELD' OF YORE.

Our days of chivalry are gone—in *re venaticâ*, as well as in *re militari*. We do not carry things on with the seriousness of our fathers. With the war-part of the nation this reminiscence has little to do, though it sends me back to the time when the old Post-office stood in College Green rang with the exultant cries of news-boys, announcing the escape of Napoleon from Elba in a third edition of the *Correspondent Post*. I can still see with my mind's eye young Mansfield, the son of an English judge, in his blue Hussar uniform, gazing with pleased astonishment at the great fact, on the placard over against King William; while an apple-woman clapped him on the shoulder, and looking up into his handsome face exclaimed: 'There, yer sowle! your thrade's alive at.' That was more than he was himself in three months after.

I can still recall the venerable head and dark sparkling eyes of old Dana, colonel of the Highland Watch,

as he related how, in the same moment, his two palms had been perforated in one of the peninsular fights; but whether by one and the same bullet, or by two, he never could tell. All he could vouch for was, that if his hands did happen to be clasped together at the time, he 'was na prayin'.' Let us hope that he could not have said the same thing on the 18th of June following, when he fell at the head of his gallant corps, and his white hairs swept the dust. Such things seem to belong to yesterday, so much fresher are they in the memory, which was then young, than any modern instance.

But our affair, good reader, is with the departed glories of the chase. We mourn the palmy state of the *Northern Rangers*, with that fine old sportsman, Lord Roden, crossing the country from Slieve Donard to the Fews without a check. No sneaking, bellowing, broken-winded hack of an agitator had a chance of coming within a view hollow of him. The present earl—alas, *quantum mutatus ab illo!*—could not have led the field after the manner of his sire, if he had ever so great a mind, for he must have always ridden fourteen stone. But, at all events, their tastes lay in an opposite direction.

Yet we must not disparage the heavy weights, remembering how many of the most eminent fox-hunters of the age could have made an archbishop kick the beam. Who, having seen, can ever forget Sir Henry Parnell, tall, portly, and stout as a quartermaster of the Life Guards? King George had not a handsomer or a better-fed member of parliament in his majesty's Opposition, or one who could ride to hounds with more thorough judgment; the right man in the right place always. I speak of those years in which the Kildare Club and the Queen's County Club were wont to rendezvous for a fortnight together, after Christmas, in some border town; and every day (Sundays excepted), one or other of their packs broke cover in the neighbourhood.

'Them was the times!' as poor old Harry Lewis used to say, when every stable and shed for miles around was in requisition; for the modern economical system of equipping a fox-hunter out of a tailor's shop was as yet unknown. Nobody had then heard of one horse and two red coats for an outfit.

Every sportsman who pretended to do the thing in fast style kept a stud. Conolly of the Black Pits—I believe his father saved bacon—had four hunters, besides hacks, always at hand. Farrell, another man of business, had half a dozen. The country gentlemen went about it with less pretension; but they were all unexceptionably mounted, and in sufficient force to be able to take their own place and keep it without distressing their cattle.

Sir Henry Parnell, however, was seldom seen among them apart from his gray steed. Of course, he did not go out every day; but thrice a week we never 'missed him from the 'customed brake.' When the chase began, he fell into his place without effort or display, went quietly along, taking no heed of those who dashed by him in their new ardour; and though he seemed, like Miss Edgeworth's racer, 'Little Botherem,' to be 'driving all before him,' instead of shewing them the way, he still kept his game in view. In the longest run, whoever could catch a sight of the dogs, was sure to descry the gallant gray and his portly rider in the same *coup d'œil*. If Conolly, or any other of the fast uns, descended from his breathless steed to vault into a cool saddle, Sir Henry generally trod past with an observation on the appearance of the green wheat, or the state of the fences, to which the other could only gasp a reply; and when the fox was killed or run aground, the honourable member for Queen's County was seen to ride away out of the field with his placid smile, leaving younger and more impulsive sportsmen to discuss the incidents and

fluctuations of the pursuit. He was the most remarkable living example in those days of the value of the maxim, *festina lente*, for he literally seemed to 'walk into' the flying foe, whilst others were breaking their necks and foundering their horses to overtake him.

An element in those reunions, which it might be improper to say we now desiderate, though certainly we have it not, was the clerical fox-hunter. It is the pleasure of modern reformers, both political and religious, to lay all the vices and deficiencies of the Protestant Church establishment in Ireland at the door of those of its clergy who in days past amused themselves with field-sports. It is no personal concern of mine to defend them. I never jumped a potato-trench in my life. Any man might easily be better employed; *a fortiori*, any clergyman. But there is too great a disposition to make a scapegoat of the sporting parson, to the plenary absolution of every other ordained offender. The great aversion and dislike with which the Church establishment has long been regarded by our Roman Catholic population, can be traced but in a very small degree to the amusements of its clergy. We should seek the cause rather, as far as personal influences have had any effect in producing it, in the tithe-system, now happily extinct, and in the pertinacity and rigour with which, in bygone times, many individuals of the order asserted what they considered their rights. The law of tithes, in all cases, imposed an odious necessity, which in many was rendered more odious by the extreme severity of its enforcement. That cause repelled thousands from the church door, who would not have turned away from the frank and cordial, though perhaps too worldly, urbanity of the clerical sportsman.

Nor would it be correct to say that clergymen of that class were, in the times we speak of, necessarily careless in their office, or indifferent as to the performance of its duties. Allowance must be made for the varying habits and customs of society. The world has become more staid and orderly, in outward deportment, since the Georgian era; and according to the sacred maxim, 'Like people like priest,' the manners of the clergy are no longer as unreserved as they were. There are men still living, and not much beyond the prime of life, who are an honour to the clerical profession, and whom I have known to partake heartily in the pleasures of the chase. Yet should you ask, Are they not now better and more effective ministers of the Gospel than they were then? I should hesitate before I replied to that question. Of course, they have done right to give up the favourite relaxation of their younger days. If they had clung to it in defiance of the altered feelings and opinions of society, they could hardly be deemed either wise or earnest members of their calling.

Yet the individuals to whom I allude were always much and deservedly esteemed in the Church; and their teaching was not considered at variance with their practice, because, in the intervals of parochial duty, they rode occasionally after the hounds. Sure I am that the other frequenters of the field were no worse for that association. Still less reason is there to suppose that they are better for its discontinuance. Young gentlemen, the sons of our gentry, did not then take the field with black pipes in their mouths and whisky-flasks in their coat-pockets; but they rode to the cover like gentlemen, and they returned after the day's sport in a proper moral condition to present themselves to the female members of the family, or occupy the hours which remained of the day in reading or business.

Honest Nat Smith—peace to the memory of a man of worth!—was a fox-hunting parson; that is to say, he rode his one horse occasionally after the Emo Pack, and enjoyed the amusement while it lasted. But he was an earnest and diligent pastor, who neglected no duty

in order to follow this pastime. On the contrary, the fine health and animal spirits to which it conducted, seemed only to render him more energetic and active in the performance of all his clerical functions. His bishop, a first-rate equestrian himself, though I cannot say that he ever sported the shovel-hat across the country, was out on a tour of inspection through the diocese, and had sent orders to Nat to attend upon him at his church. But the curate thought himself bound to do the full honours of the parish to his commanding officer. Instead, therefore, of waiting in band and surplice, to receive him at the gate, he mounted the old bay, and met his lordship, as a high-sheriff meets a judge, at the bounds of his jurisdiction.

The bishop came cantering on a noble iron-gray, of which kind he always kept the most perfect stud in the church, and haughtily waving his hand to the curate's humble salutation, rather accelerated than checked his speed, as he passed on. But Nat was not to be thrown out in such a race. He knew his distance well enough, and therefore did not venture to make it a neck-and-neck affair. Still, withal, he would not be left to ride along with the groom, but kept the bay well in hand, close upon his lordship's crupper, yet a little at one side. After a rasping gallop over two or three breathing hills, the bishop saw that the thing was not to be done—for he had evidently purposed to get to the church before the parson could be there to receive him—and so he condescended to pull up and enter into a colloquy over his left shoulder.

'I suppose, sir,' his lordship observed interrogatively, 'you hunt all the week, and ride a steeple-chase on Sundays?'

'I seldom go beyond the pace we have been keeping just now, my lord,' replied Nat; 'for, indeed, no one nag could stand it.'

This was enough for the dignitary; and as such men, when they have any spark of manly generosity in their character, always admire the independence which temperately asserts itself, he ever afterwards accosted Nat with unusual courtesy. But he gave him nothing. My poor friend lived and died a curate; that, however, seemed to give him little concern, for he had means sufficient to supply his simple wants, and a surplus besides, for the indulgence of a benevolent and hospitable nature. 'What more need I wish for?' he would say, 'without chick or child; unless, indeed, it were the position which even a nominal preference would give me in the eyes of others; and that, I own, would gratify me in my old days. But it cannot be helped; and while they, who know me best, think well of me, it can be easily endured.'

'But, Nat, my friend,' I asked, 'how comes it that you are arrived at this time of life without a family around you? you who are endowed with so many social and domestic virtues, and would have enlivened the hearth by your pleasant temper and good spirits; why did you never marry?'

'Ah, don't ask me that,' he answered with a droning gravity. 'The question reminds me of a great fright and a great escape. You know what an easy-tempered fellow I am; a butt for every one, in fact, like Falstaff, and how even now, with the snows of sixty above my brows, men of all sorts, and women too, "take a prize to gird at me." Striplings of twenty address me by my Christian name; and that, indeed, not in its entirety—as your modern revivers of old barbarisms say—but in its undignified monosyllabic abbreviation. It was the same thing always, and I should be an ungrateful wretch to complain of it; since it is to a sort of equivocal connected therewith, I feel now indebted for my free condition. I did once put the momentous question in a fit of heedless desperation at a slight, fancied or imaginary, from one to whom the poor heart would fain have proposed it, but dared not. In the moment of rankling disappointment, a young

one crossed my path, of whom I wish now to say nothing worse than that she would not have suited me at all for a wife: but in my vexation of spirit at the time, I thought she would just do; and so I put the question to her, plain and short: "Miss, will you marry me?"

"That was courageous!"

"Courageous, sir? It was rash; it was desperate! The words had scarcely passed the fence of my teeth, when I was seized with a tremor, and would have given my best horse—for at that time I had two, a Sunday hack, and one for work, you know—to recall them."

"But her answer, Nat—her answer?"

"Oh, that was short, sharp, and decisive. She could not speak at first for laughing; for she was a giggling thing, and—if you will pardon my vanity—I think the joy and surprise set her off on this occasion more than usual. But the answer was not long a-coming."

"And what was it?"

"I will, Nat!"

"Why, man, that was an acceptance."

"So you may think, sir; but I received it in another sense; for, Heaven bless her, she was a Dublin girl, and gave out her syllables with the peculiar tone and twang of that sweet city, where they call Tom, Tam; and George, Jarge."

"And I suppose you will say not—nat."

"Of course: and so did I construe it."

"O recreant knight,

Have you not heard it said full oft,

A woman's nay doth stand for naught?"

"Yes; so I have been told, and I partly believe it; but in my bachelor's vocabulary, a woman's nat doth stand for nay, and to that reading I nailed her."

"And how did you convey your interpretation?"

"Simply by looking very disappointed; asking pardon for my presumption, and saying: "Since you will not—you may be sure I emphasised the *o*—there is no more to be said."

"Cruel Nat! Pray, how did she take that sting?"

"Why, she laughed again, but not quite so boisterously as before; and ever after she called me Mr Smith when she spoke to me; leaving no room, had I repeated the question, for mistaking her meaning. I must add, he concluded with a chuckle, 'and let it be a lesson to you, my young friend, how you put questions—that lady is still alive, and the mother of twelve children!'"

Our theological chapter would be imperfect without the priest. Few complete 'meets' wanted that feature; and a fine broad one it was, unlike the whey-faced species which ultramontane asceticism is introducing pace into our rural economy, contrary to good-fellowship of every kind, and very much against the face of our sovereign lady the Queen. If the fox-hunting parson was commonly a *fourteen-stunner*, the *fox-hunting* priest was equal to that at least. He was distinguished by his rotundity of jowl—so large, as to justify the wit of the Maynooth barber, who proposed to take a contract for shaving the whole *idge* by the acre—and so hard and red, that nothing, in these degenerate days, can be its parallel, if it be that of Mrs Fleming's 'cherry-coloured hams.' By hat and the tan boot-tops, surmounted not unfrequently by drab unmentionables, P.P. might be picked out of ten thousand.

Dr Doyle (J. K. L.) had not yet put his interdict on the chase, nor, with terrible hospitality, sweated down the big proportions of his clergy by the periodical festivities of a *Retreat*; but he had begun to look askance at their uncircumscribed dimensions, and hinted desire to be surrounded by boon-companions the very opposite to the taste of Julius Cæsar; for whereas *old Roman* wished to 'have men about him who

were fat,' Cassius himself could not be too lean for the lenten convivialities of Braganza Hall.*

It is considered orthodox when an agreeable bishop meets his clergy in conference or at a visitation, that he should provide a repast for them, and in every way manifest a lively interest in their good case. I have known an archdeacon at the primate's dinner in Drogheda, acting, of course by authority, to rate the neglect of the caterer, who had failed to provide a salmon, with as much severity as if he had committed a breach of the Thirty-nine Articles. 'Sir,' he said, 'you might as well leave out the Athanasian Creed on Easter Sunday, as omit a *Boyne salmon* from the visitation-dinner of this loyal diocese.'

But our starch prelate of Salamanca, far from caring for the good cheer of his priests, or betraying the least satisfaction at their jolly condition, sometimes began his allocution with some such phrase as—'My reverend brethren, I am grieved and scandalised to see you grown so fat. Father Martin, that ruddy complexion ill becomes you. Mr Keogh, you must endeavour to grow less muscular, or you will never rise in the Church.'

One of the divines so reproved was a sporting curate, who, long after a positive prohibition against the chase was issued, found a way to follow his favourite amusement, whilst his obedience to his spiritual master moulded no feather. This was managed with nice address. He usually had two or three parochial calls of no pressing urgency, on a hunting morning; and they were arranged with such geographical tact, that whatever direction the game might take, there lay the path of his reverence's duty. 'If he be a sporting fox,' he would say, 'he will make for Ballinakil; and it so happens, more by chance than good-luck, that a very old woman has sent me a message by her grandchild that she would be glad to see me some fine morning. She lives close by the wood there; and a finer morning surely for going to see the poor old lady than a southerly wind and a cloudy sky give earnest of, neither she nor I need expect at the season of the year. Well, then, the shortest way, next to that which the bird flies, is the way a dog-fox, when in good wind, takes towards the place he desires to reach without the least possible delay. Away I go then, the shortest road, over field and fallow, hedge and ditch, for Ballinakil; but if at the same time a pack of dogs happen to be running after a wild baste in the very same direction, how can I help that? *Nihil occurrit ecclesie*. No hindrance or obstruction is to retard the march of the church. The bishop himself, no, nor the pope, would not have me go round.'

Thus, in whatever point of the compass the scent lay and the game broke away, in that line of duty Father Festus had a call, and he never neglected it as long as he had a horse to carry him. Peace be with his ashes; he was a hearty, kind, and worthy man. I wish his mother, the Church of Rome, had in this land a thousand anointed sons of the same tastes and the same temper. Her present progeny, what are they like—prowling about everywhere with their eyes looking in all directions except in the faces of honest men—but a pack of poachers?

If the fox is now doomed to die without benefit of clergy, it may be some compensation that his last run is seldom uncheered by the presence of the softer sex. The meet, if not the finish, is beautified by an imposing concourse, or, as Bob Blake happily malaprops it, an imposing conquest of spinsters and their mammas, such as our ancestors never were wont to behold in that situation. The full, practical extent

* Braganza House, built in the neighbourhood of Carlow by the late General Sir Dudley Hill, and purchased from him as a residence for the Roman Catholic bishops of Kildare and Leighlin.

of feminine sympathy in the chase was expressed, fifty years since, in the song—

The dogs began to bark,
And I went out for to see;
A prattie young man came a-hunting,
But he was na hunting for me.
Oh, what 'll become of me?
Oh, what shall I do?
There 's naeboddy comin' to marry me;
Naeboddy comin' to woo!

But this won't do any longer. The prattie young maidens go a-hunting now-a-days on their own hook. Equipages are congregated at the wood-side, and when the dogs throw off, and some old sportsman would fain lose no time in getting upon their track, too often Mrs Quigly's jaunting-car stops the gap, or the four Miss Kildarbies, in their one-horse fly, trot across his path, mocking the air with colours idly spread. On such occasions, Irish politeness is put to the very pin of its collar to acknowledge that the right women are always in the right place.

Yet there is something extremely diverting in the ardour with which the fair ones follow the game, especially those matrons who have olive plants to dispose of. How they do whip over highways and byways, in the hope of falling in with the red-coats again; and how skilfully they make their casts towards the most likely places for such chance rencontres!

The Donnybrook road on the 'walking Sunday' was the sight of all sights, with its triple row of cars laden with beauty in its flashiest attire; but it may be questioned if the pace of that renowned celebration could at all compare with the speed of barouches, phaetons, and jarvies, which transfer their delicate freights, on any hunting morning, from one cover towards another, in the hope of crossing upon the fox's path in his flight.

It is strange that fair young creatures should take such an interest in that amusement; and stranger still, how the *guterfamilias*, whose bones one might almost hear rattling in the rugged transit, affects a super-womanly delight in it. With her, such a forenoon's avocation is surely the pursuit of sons-in-law under difficulties.

MODERN LEPROSY.

THE great diseases of the middle ages, such as the sweating sickness, the various forms of plague, the dancing mania, and other epidemics, have had this much in common, that, although they exhibited for a long period a disposition to break out afresh under favourable circumstances, they at length so completely disappeared, that mankind have come to regard them more in the light of medical curiosities than as great afflictions which devastated the most fertile and populous regions of the earth. There was, however, a malady—endemic all over Europe from the tenth to the sixteenth century, not characterised, like epidemics, by rapidity of attack or excessive mortality, yet regarded, if possible, with still greater alarm. This disease, the leprosy, long supposed to have become extinct, has suddenly of late years assumed a fresh activity; and as many distinguished physicians maintain that a general outbreak is now imminent, some account of its nature, mode of development, and results, may not be uninteresting.

The old leprosy, made familiar to us from the important position it occupies in the hygienic code of the Jews, prevailed for more than 500 years on the continent of Europe, in Great Britain, and in Ireland. Its treatment forms rather an interesting chapter in the history of civilisation. In many countries, the unhappy subjects of the disease were looked upon with extreme aversion. Their affliction was considered the effect of an especial vengeance of God, for grievous

sins committed by themselves or their forefathers; and oftener than once, during the existence of a panic, attendant upon a violent epidemic, large numbers of helpless lepers, on a charge of having poisoned the wells, were barbarously put to death. In other countries, again, a treatment the very opposite was pursued. Kings thought it a privilege to wash their sores, and no gift was considered more expiatory of sin before Heaven, than bequeathing a magnificent gift to a leper-hospital.

The condition of the leper, even in the most civilised countries, was extremely sad. In addition to the inconvenience of his loathsome and incurable malady, he was prevented using any means for his own support: such property as he might have owned was taken from him; the law classed him with idiots and lunatics; and a belief in the contagious nature of his malady, led to his perpetual seclusion. The hospitals or leper-houses provided for their retreat were very numerous; there was scarcely a town of any size without an establishment of this sort. Some, richly endowed, were exclusively devoted to the leprosy, and placed under the jurisdiction of special officers; others, again, were attached to monasteries, and subject to ecclesiastical supervision. Lazar-houses of both kinds abounded in Scotland: there was one at Aldneton, in Lauderdale, superintended by the monks of Melrose; there were similar institutions at Elgin, Ayr, and Aberdeen; a leper-hospital was raised at Glasgow in the reign of King David II.; while one was erected at Greenside, so late as 1589, for the benefit of the inhabitants of Edinburgh. These, as well as the large establishments in England and on the continent, fell gradually into disuse, and their revenues were appropriated to other charitable purposes, or not unfrequently seized upon by a rapacious court favourite.

Leprosy, however, as we have said, has begun to develop itself anew. It exists at this moment in different parts of the world, but is especially prevalent in the West Indies and in Norway. Out of the comparatively small population of Norway there are upwards of 2000 lepers. Occasional cases make their appearance nearer home.

There are two varieties of the modern or existing disease—the tubercular, and the anæsthetic or joint form. The former is much more common, and unfortunately almost hopelessly incurable. It presents the most characteristic type of the disease, giving that painful appearance to the countenance which has in all ages made 'the hoar leprosy' so repulsive. The spots generally shew themselves first on the face, but by no means uniformly there. Their colour varies from a glistening white to a dark blue. As the disease advances, and the peculiar morbid deposit enters more extensively into the system, the beard, eyebrows, and eyelids fall out, the voice grows affected, and the sight becomes seriously impaired. These symptoms are constantly aggravated by depression of spirits until at length, after the invasion of different important internal organs, death releases the sufferer. The average duration of this form of leprosy is about ten years—a prolongation of life we may probably ascribe to the immunity of the bones from the disease, an immunity that among other advantages permits mastication, and in consequence, so far leaves the function of digestion unimpaired.

The other, or anæsthetic variety, affects the joints of the hands and feet, and is characterised by a numbness of those parts. Not unfrequently, if the disease be about to develop itself in the upper extremity, the patient complains of a cold feeling, extending from the elbow downwards. Wasting of the affected muscles ensues, and the patient becomes unable to put on a glove or to use a needle. The disease speedily attacks the osseous texture below, and a joint is often removed

with the neatness of a surgical operation. Very frequently this form of leprosy is arrested in its progress, and the patient recovers with a maimed foot or hand. In other cases, again, the disease goes on to develop itself in more vital parts.

There is no especial age at which either variety shows a tendency to appear. The disease has been noticed alike in childhood and at advanced age. In the West Indies, the white population is much less liable to it than the natives or the Jews. Women also seem to possess a greater immunity than men.

Leprosy is a disease essentially dependent upon a blood-poison, belonging to the large class of which scrofula, cancer, and rheumatism are representatives. It unfortunately further resembles these in the difficulty of its cure. Almost every article of the pharmacopoeia has been employed for this purpose, yet a specific remains to be discovered. But although incurable, it is satisfactory to be assured that the great source of terror in earlier ages—namely, dread of its communication by contagion—is completely groundless. Repeated observations have established this important fact. At the same time, the hereditary character, or as medical men say, the hereditary tendency to the disease is not denied. It is not unfrequently seen to pass over one generation, reappearing with fresh vigour in the next.

We are quite as ignorant of the causes of leprosy as of its treatment. With respect to other diseases, whose cure frequently baffles medical science, we have almost invariably some acquaintance with their predisposing causes. We know that exposure to infection, deficiency of certain articles of food, breathing a polluted atmosphere, predispose respectively to typhus fever, scurvy, and cholera. But no peculiarity of climate, atmosphere, or diet satisfactorily accounts for the decay in one age or the development in another of the leprosy poison.

That this disease, like all others, has its own natural law which, though undiscovered, we cannot regard as apocryphal, is undoubted; and we trust that the increasing attention to it now excited among medical men and physiologists, may lead to an early discovery of them. Meanwhile, with all our uncertainty, we may confidently assert, that attention to the general principles of hygiene will be found by communities and individuals the most effectual preventives, should be apprehended outbreak of this disease unhappily occur.

KIRKE WEBBE,

THE PRIVATEER CAPTAIN.

CHAPTER III.

After saying 'Grace,' as described in the last chapter, Captain Webbe suggested, that as it was a tough run he had to spin, it might be as well to ascertain previously how my grandame was doing, and so arrange that we might be secure from interruption. I agreed, and hastened to the Crown Tavern. Mrs Linwood was found, considerably better, but still lamentably weak and nervous. A fly was at the door, in which, accompanied by Mr Beale and Nancy Dow, she was about to be conveyed to Oak Villa. I placed my mother's letter in her pocket, and, having seen her safely off, joined my new friend at the Royal Hotel.

Captain Webbe had made preparation, during my brief absence, for a cozy as well as lengthened sitting. The fire had been replenished, and heaped up on the hob; and a bundle of cigars, decanters filled with ruby and amber coloured wine—no doubt, for my

supply of brandy and hot water—had been placed upon the table.

'Take a cigar,' said Mr Kirke Webbe, 'if only to oblige me; it may prevent that quite sufficiently open countenance of yours from yawning insufferably, and, moreover, shade, in some degree, its inquisitive brightness, which might else dazzle and confuse my ideas.'

'I daresay, captain, you think that very clever—I don't. Nevertheless, I shall take a cigar—two or three, possibly, if you are especially tedious. And now, if you please, go ahead.'

'Nay, I must first go back, and a long way, too—as far back as 1792—in the autumn of which year two gentlemen and bachelors, of about the same age—twenty-five, namely—who had never met before, made each other's acquaintance whilst shooting over the Lord Petre's well-stocked covers in the vicinage of the market-town of Romford, Essex. One of those gentlemen-bachelors was William Linwood, only son and heir to Robert Linwood, hide and skin merchant—who had departed this life in Leadenhall Street, London, about three years previously—and Margaret his wife, who, since her husband's death, had withdrawn to Wales, where she found exercise for her constitutional activity in the superintendence of a large dairy-farm, the profits whereof were to aid her son in achieving the high social position to which, in her fond opinion, his personal and mental gifts so well entitled him. I speak too rapidly, perhaps?'

'Not at all. Allow me, however, to remark, that your speech would be pleasanter if it were less sardonic—jibing; but that is, I fear, a confirmed habit, and one which you take perverse pains to cultivate.'

'If that, Master Linwood, is your serious, well-considered opinion,' drawled Captain Webbe through his nose, simultaneously with the ejection in the same way of two jets of smoke from a fresh cigar, 'I must lose no time in endeavouring to mend my manners in that particular. To resume, nevertheless, a narrative to which a deeper interest attaches just now than to wisest words of babes and sucklings. The other youthful sportsman, I was going on to say, was Mr Kirke Webbe, at that time, and in a social, pecuniary sense, an indefinite gentleman, whose parents had both died during his legal infancy, and whilst he was undergoing the preliminary ordeal of midshipmanship, consisting chiefly of mast-headings, on board his majesty's ship *Gladiator*. A worthy, most worthy couple,' continued Webbe, with sudden seriousness, 'who, from prudential motives, did not marry till late in life, after a courtship of twenty years, lived in perfect harmony, and died within four days of each other, leaving to their idolised boy something over a thousand pounds, scraped together by ceaseless industry and inflexible self-denial—one life, one hope, one tomb!'

'A striking proof, Master Linwood,' resumed Webbe more briskly, after emptying his tumbler at a gulp—'a striking proof, I say, Master Linwood, that virtues, unlike certain diseases, are not always hereditary; unless, indeed, they are governed by the same law as transmitted insanity and gout, which are said to skip usually over one generation, in order to fasten more certainly on the next: according to which hypothesis, my son should be a model youth.'

'You have a son?'

'Truly, I have. Harry is a few months, I think, older than you, and about the same height and figure. But my good young friend, we are steering a very

keep a little closer to the wind. Kirke Webbe, I was telling you, having scrambled through the preliminary six years of midshipmanship, would, there could be no doubt, have creditably passed for lieutenant—he would be a very sorry lubber that did not—when a difficulty occurred between him and Old Blueblazes, captain of the *Gladiator*—

‘Old Blueblazes!’

‘His ship sobriquet, of course, derived from the flaming hue of his proboscis. A grim old salt was he, fit for nothing upon earth but fighting and drinking, in both of which accomplishments it is but doing him justice to say he was A1. The difficulty with me fell out thus. But first please to understand, young sir,’ continued Webbe, ‘that I go over these matters with you, inasmuch that as it is certain some good-natured friend will inform you, if he has not done so already, that I was kicked out of the royal navy, it is well with reference to the copartnership we have entered into that you should be acquainted with the true version of the affair. The difficulty, I repeat, between Blueblazes and me fell out thus: the *Gladiator* lay at anchor in Plymouth Sound. The old fellow was, I supposed, in his cabin sleeping off the fumes of his after-dinner grog; the lieutenant of the watch, a moony sort of chap, was perched upon one of the guns about midships, reading a book, with his face towards the bows, when the devil, who so delights in finding work for idle boys and men, suggested to me and another promising youth to have just one quiet turn at leap-frog upon the sacred quarter-deck.’

‘A turn at leap-frog upon the quarter-deck!’

‘Just that, my ingenious young friend. I am not surprised that, landsman though you are, your hair stands on end at the bare mention of such an enormity. Mine did whenever I afterwards thought of it, gradually falling off in consequence, till I was left, as you see, nearly as bald as a coot.’

‘Well, I had my leap, and was making a back for my friend, when the captain suddenly seized me by the neck, and had I not clung to him like grim death, would, I verily believe, have pitched me into Plymouth Sound. Finding, however, that if I went over the side, he must follow, he dropped me on my feet, at the same time favouring me with a couple of tremendous cuffs in the ear, that set my brains spinning like a top. But for that, I could never have had the inconceivable audacity to up flat, and deal a post-captain a blow on the chest, which knocked him clean off his pins, and laid him sprawling upon the quarter-deck.’

‘Are you serious in saying that you knocked down the captain?’

‘As sure as you sit there, I did—impossible, preternatural as it sounds. No great thing, either, to do in itself; one of the captain’s legs being crippled with the gout, and the other a wooden one.’

‘Imagine, if you can, Master Linwood, the wild consternation, the hurricane-uproar that arose as it passed through the ship that that devil’s cub, Kirke Webbe, had flogged Old Blueblazes! Officers and men seemed to think the world had come to an end; and death, or worse punishment, was unanimously awarded to the sacrilegious culprit.’

‘Blueblazes himself, who at bottom was as placable and generous as he was bibulous and brave, was the least excited and angered of them all; and, though I was no favourite of the rough old salt, it was his cockswain that, in the dead of night, released me from confinement, led me past the sentry—who had suddenly become deaf as well as blind, the cramp in my legs causing me to stumble heavily when within a yard of him—lowered me from a port-hole into a shore-punt alongside, and cast off the painter with a curse—his own, and a curse—the captain’s—containing ten guineas, which he flung after me.’

‘You now know, Mr Linwood,’ resumed Captain Webbe, after another gulp of the fiery liquid, which had no more visible effect upon him than water upon a duck’s back—‘you now know how it happened that the king’s service and I parted company. I was then close upon twenty-one years of age: the day after attaining my legal majority, I obtained possession of the before-mentioned thousand pounds odd; and the next four years were passed in acquiring a knowledge of the ways of mankind, as displayed in London; an interesting study, which the limitation, rigidly adhered to, of my expenditure to two hundred pounds a year, greatly hampered, as you may suppose.’

‘Nevertheless, I may say without vanity that I had made progress by the autumn of 1792. Moreover, my thousand pounds odd having by that time diminished to two hundred, I bethought me that it would be prudent to delay no longer an endeavour to turn that knowledge to practical account; and it was more for the sake of being able to ask myself quietly a few important questions, than any love of sport, that I accepted leave to beat up the Lord Petre’s Essex covers. There fate willed it that William Linwood and I should meet for the first time; be mutually pleased with each other, and swear eternal friendship; or rather, we should have done so, but for an untoward accident which befell us both.’

‘What accident?’

‘Falling in love with the same damsel—the young and charming Emily Waller, sole daughter and heiress presumptive of Anthony Waller, Esq., of Cavendish Square, London, and then upon a visit at Hare Park, not far out of Romford.—Touch the bell, if you please; the fire is getting low.’

‘Pray go on; you tantalise one terribly.’

‘William Linwood and I fell into bondage instantaneously; he irredeemably—whilst I was a much less willing and tractable captive. In fact, between you and me, I doubt that I was really a captive at all. My fancy or imagination was no doubt considerably dazzled by the young lady’s personal charms and graces; but much more, I am pretty confident, by the reflected lustre of her reputedly large fortune.’

‘I can easily believe that, Mr Kirke Webbe.’

‘Which shews, Mr William Linwood, junior, that you can appreciate character. Well, having then a very good opinion—which has really improved upon better acquaintance—of my worthy self, I saw no reason why I should not compete with Mr Linwood for the favour of the amiable heiress presumptive; and thus it came to pass, as before intimated, that the flame of friendship received a damper.’

‘Very absurd that, you will say,’ presently continued Captain Webbe, ‘when I inform you that the lady did not condescend to honour either of us with the slightest notice, except by carefully avoiding the paths and places we usually frequented! I, for my part, bore the pangs of despised love with a noble equanimity; but poor Linwood, having fallen into a state of semi-distraction, finally hit upon the remarkable expedient of endeavouring to obtain access to Miss Waller’s presence, by striking up an innocent flirtation with her *demoiselle de compagnie*, Mademoiselle de Féron.’

‘Louise Féron, the Frenchwoman we saw to-day!’

‘Louise Féron, the Frenchwoman whom your grandmother so viciously assaulted a few hours since; but at the time I am speaking of, a handsome young person, calling herself Mademoiselle de Féron, and pretending the sole remaining scion of a recently extinguished and noble French house. She had been engaged to perfect Miss Waller in the French language, and her youthful mistress was much attached to her. Let me see—where was I?’

‘Speaking of my father’s flirtation with De Féron—or Féron.’

'Right! To continue, then. How the unfortunate misapprehension on the demoiselle's part arose, I cannot say—her bad English and Linwood's worse French had no doubt much to do with it—but it is certain that she fully believed the young Englishman to be madly in love with her, and dying to make her his lawful wife.'

'Could that be her serious conviction?'

'Her serious conviction! I should think it was, indeed; and a trifle over. I had abundant proof of that. Finding I had quite recovered from love-fever—a very mild attack, as I have said—Linwood gave me a letter one fine day for Miss Waller, which I undertook to place for delivery in Mademoiselle de Féron's hands. I met that volcanic individual in Hare Park, and fulfilled my commission. Fire leaped from her dark eyes at sight of the direction in Linwood's hand, and you should have seen the rage and hate that blazed in them as, having instantly torn open the letter, she devoured its contents. That done, she tore it to shreds, flinging the same at innocent me, and accompanying that demonstration by a shower of epithets and imprecations, which was quite decisive of her birth and status in French society.'

'The next day but one, Miss Waller left Hare Park for London with her demoiselle de compagnie; and I lost sight of Mademoiselle de Féron for nearly three years, during which, Linwood, having managed to obtain a proper introduction to the family in Cavendish Square, had wooed, won, and married Emily Waller; and you, Master William, were passing with promise through the first of man's seven ages. Have you yet reached the *third*, may I ask?' added Captain Webbe with keen abruptness.

'The third! What the deuce do you mean?'

'That of the lover, to be sure—'

With a woful ballad,
Made to his mistress's eyebrow.'

'No; my time is not yet come.'

'I am rejoiced to hear that,' exclaimed Webbe; 'it almost insures the success of our bold venture.'

'The plague it does! As how, pray?'

'Anon—anon, my dear fellow. I was saying,' continued Webbe, 'that three years elapsed before I again sighted Linwood after we left Essex. The same fate that had befallen him, had overtaken me. I also was a husband and a father. Mademoiselle Féron—she had modestly dropped the '*de*'—was still languishing in single blessedness—at least she said so then, and I believe she spoke the truth—and had lately re-entered your mamma's service as nurse, or nursery-governess, to your infant highness. What her motive could be for accepting a menial situation in your father's family, puzzled me. Poverty might be one compelling motive; but I wronged her grossly if some vague but abiding purpose of working mischief to the man by whom—to the woman for whom—she had been, in her own belief, scornfully slighted and wronged—was not another and more powerful one.'

'A circumstance that occurred during my visit to South Audley Street, where your father then resided, confirmed that impression or belief; albeit it is, I admit, barely possible that I misinterpreted that accident or circumstance.'

'You were suffering from hooping-cough, and a moroxism of that distressing malady had left you exhausted, apparently dead, when I softly entered the drawing-room where Louise Féron was standing with her back towards me, and holding you in her arms. She did not hear my footfall, and her face and person, reflected in a lofty pier-glass, fronted me. I stopped suddenly short, shocked, though never a man of super-sensitiveness, by the fiendish expression of the woman's countenance, immediately explained by her sudden, leady grasp of the infant's mouth and nostrils with

her disengaged right hand. The child's suspended breath would, I can scarcely doubt, have been for ever stilled but for the exclamation which betrayed my presence. Féron turned sharply round, confronted me with a face of flame; rallied, assumed as well as she could, an air of indifference, and left the apartment.'

'You of course informed Mr and Mrs Linwood of what you had seen?'

'I did not; for several reasons. In the first place, I might have misjudged the woman's intention; and in the next, I felt quite sure she would not try it on a second time after a hint I quietly gave her, that the child's death, under any circumstances, should be followed by an investigation that would probably only terminate at the Old Bailey.'

'You acted, Mr Webbe, with unpardonable weakness, if not with'— I checked with difficulty the words upon my tongue, and substituted for them— 'Yes, with unpardonable weakness, as the catastrophe of your narrative, plainly foreshadowed by what I have already heard, too clearly proved.'

'That which you have already heard does *not* foreshadow the catastrophe of my narrative,' retorted Webbe. 'Clearly as you may be able to see through a millstone, it is hardly possible you can discern a catastrophe which has not yet occurred.'

'You speak riddles; but go on.'

'Could I have foreseen the lamentable consequences of interrupting Mademoiselle Féron's manipulation of the child's mouth and nostrils,' continued Webbe with acrid humour, 'I should have been strongly tempted to have turned noiselessly away, and left her to the quiet accomplishment of her purpose.'

'Upon my word, that is cool, Captain Webbe!'

'It would have been a blessing to all parties had I done so,' said the privateer captain. 'To you, who, dying in your innocence, would be at this moment an angel in heaven—a contingency which must now be booked as extremely doubtful at the best: to your father, who—the Féron's instinct of vengeance having been satiated—would not have had the best years of his life rendered miserable by an accusation which to this hour he has found it impossible to repel. But we are all poor short-sighted mortals; and, unconscious of the mischief I was doing, I, as before stated, saved your life.'

'For which piece of mischief, many thanks, Captain Webbe. I drink your health.'

'I, yours; hoping as I do so, that we may yet succeed in discovering a remedy for that unfortunate mistake of mine. But to make sail again. Anthony Waller, Esq., of Cavendish Square, finding himself lonely after his daughter's marriage—which he had never very cordially approved of, you must know—espoused a lovely young widow, and the mother of one only child, Lucy Hamblin, then in her third year, and really quite a miniature angel. Mr Waller not only doted upon his handsome young wife—that, like reading and writing, comes by nature—but upon his little step-daughter; so that your nose, which, without flattery, it is difficult to believe can be the natural development of the unpromising little pug Mademoiselle Féron took such liberties with, was quite put out of joint.'

'This vexed your mother, and, let the truth be told, mightily exasperated your father. There had been no pre-nuptial settlement; and it was feared that the lion's share of Mr Waller's wealth would be diverted to his new wife and "her intrusive brat"—a frequent colloquial amenity of my friend Linwood, duly reported in the proper quarter by the Féron, who, having managed to transfer her services to the Wallers, was now little Lucy's nursery-governess.'

'Thus stood matters in Mr and Mrs Waller's seventh honey-moon—a mellifluous phase of the earth's satellite, which the observation that with extensive view

surveys mankind from China to Peru, will have noticed to be of indefinite duration when the poor and pretty bride happens to be about half the age of the rich and senile bridegroom.'

'Which was not the case in that particular instance, I beg to say.'

'Very nearly the case, I should say; but we will not discuss that fact in natural history just now. The Wallers, I say, were residing, towards the close of their seventh honey-moon, at Clarence Lodge, near Gravesend. At that time, I was in personal communication with Mr Waller, with the hope of inducing him to make one of a company for organising privateering enterprise upon a large scale. I did not succeed; but before I received a final "No," Linwood came down, unaccompanied by either his wife or son. That, however, though made a great deal of subsequently, was easily explained: your mother, as doubtless you are aware, having suffered much from ill-health during the first six or seven years of married life. I think she gave birth to four children, certainly three, who all died under a month old—a fatality which was the main reason that you remained in Wales with grand-mamma. Be that, however, as it may, Linwood came alone, uninvited, and his reception was glum as winter. Nevertheless, he seemed to have made up his mind for a lengthened stay; and, which certainly looked odd, seemed anxious to conciliate the favour of little Lucy Hamblin. Your mother explained to me the other day that he did so by her advice, she thinking that a better feeling might be thereby brought about between the families.'

'The eighteenth of August—a date branded upon the memory of all of us—found William Linwood still a guest, and an unwelcome one, at Clarence Lodge. The day had been sultry, thunderous, and Mr Waller and I, towards evening-fall, after a cool walk in the garden, were seated in the arbour, and enjoying some prime cigars.'

'Mrs Waller had been uneasy for some time on account of the prolonged absence of Louise Féron, who had taken the child out for a walk early in the afternoon; and when the day began to decline visibly, and no Féron, no Lucy appeared, Mr Waller grew fidgety also. He had asked very often for Linwood, and was for the twentieth time remarking upon his non-appearance at the dinner-table, when we saw that gentleman enter the garden by the back-gate.'

'His hair, we could not but remark, was wet and disordered, his face pale, his aspect generally flurried, ill at ease.'

'Hollo, Linwood!' I exclaimed, as he was passing the arbour; 'what is the matter? Have you seen a ghost?'

'Eh!—eh!—what?' he stammered; 'a ghost—stuff! Has—has,' he added—'has Louise Féron returned?'

'No,' said Mr Waller; 'and—— By Heaven! here she comes by the same way that you entered, Mr Linwood, and without the child!'

'Without the child!' echoed the woman, sweeping up. 'Why, Mr Linwood has brought home the child, has he not?'

'No—no!' exclaimed Linwood, in great agitation. 'She left me on the sands, and rejoined you, did she not?'

'Rejoined me!' screamed Féron. 'Why, I saw you with my own eyes take her into a boat, and sail out upon the river.'

'No—no—no!' vehemently rejoined your father. 'I meant to do so, but Lucy gave me the slip.'

'Liar—assassin!' shouted the woman. 'I saw the child with you—alone with you in the boat: you have drowned—murdered her! *A la garde!*' shrieked the seemingly frantic creature, as she rushed upon and grappled poor Linwood, who, in his bewilderment, had

really made a movement as if about to run for it—'seize—bind the assassin! Help—help!'

'As for me,' resumed Captain Webbe, after a consolatory drink—'as for me, I was knocked over—flabbergasted; and it was hours before I could get my ideas into any kind of order or ship-shape. And so confused now is my recollection of the different versions given by Linwood and Féron; so mixed up are they in my mind with the outrageous inventions and distortions of the newspapers, that, if my life depended upon it, I could give you no intelligible digest of the conflicting statements. Enough to say, that on the morrow, no doubt remained that Lucy Hamblin had been drowned—her hat was cast ashore with a mass of sea-weed—and public opinion gradually settled down into a conviction that your father, for obvious purposes, had compassed the death of the child—a conviction which his flight, in violation of his pledged word, seemed to affirm beyond controversy. He was pursued and apprehended, as you are perhaps aware, at Llanberis farm. Take a pull at the brandy and water, Master Linwood!'

'Go on, will you? Do you think I am made of stone?'

'There is little to add, except that Féron absconded, leaving a note to the effect that she could not, would not, upon reflection, appear as a witness against the husband of the best friend she had ever known. Your father was ultimately liberated without trial; and after striving for several years to bear up against almost universal obloquy, took ship for America, and was captured in the Channel by a French privateer. So ends the story.'

'And with it the hope you have so wantonly kindled, merely, it should seem, to trample it out! What purpose can be answered by the fast-and-loose game, which, as far as words count, you seem to be playing?'

'A great purpose will be answered by the game I propose to play, if you have the pluck and skill to perform your part in it. I tell you again that the catastrophe which will either acquit or finally condemn your father has not yet come to pass. The last decisive act of the drama has yet to be played; and the curtain rose upon that last decisive act, after an interval of nearly fifteen years, about three months since only. Scene the first: Rue Dupetit Thouars, St Malo, Brittany. Enter from opposite sides, a lady and gentleman, who, upon seeing each other, exclaim at the same instant:

'Mademoiselle Féron!'

'Le Capitaine Webbe!'

'Kirke Webbe, captain of the *Scout* privateer, met walking openly in the streets of St Malo! Come, that is a bold flight, even for a modern dramatist!'

'It is a positive fact that I was so met! And as to walking openly in the streets of St Malo, there is no wonderful daring in that: I was playing at rouge et noir, in the Palais Royal, Paris, last Sunday three weeks. Just, however, to bring back colour to those white cheeks, and give you an appetite for the dinner I have ordered, and which ought to have been served by this time, I will give you a hint of some one else I met with in St Malo—to wit, a charming damsel of some seventeen years of age, whom I propose that you shall marry.'

'Let us have no untimely jesting, if you please.'

'A charming damsel, whom it is part of my plan, and may be essential to its success, that you should marry: a most amiable damsel, who calls herself Clémence Bonnevillie; but whose true name, if I am not the dullest blockhead that ever breathed, is—Guess?'

'*Tut!* How should I be able to guess?'

'Whose true name is, I say, not Clémence Bonnevillie, or De Bonnevillie, but—*Lucy Hamblin*—the child supposed to have perished fourteen years ago in the Thames!'

'All-merciful Powers! Can this be true?'

'If it prove not so, write me down an ass, in capital letters. Ha! dinner at last!'

THE OCEAN TELEGRAPH-CABLE ON ITS WAY TO THE BOTTOM.

That longest yarn that has ever been spun—that newest sea-serpent which out-herods and puts to shame all the old ones so carefully chronicled by penny-a-liners—that fact so much more wonderful than fancy, that not even the shadow of it was conceived by the brain which invented fictions for a thousand-and-one consecutive nights in the imaginative surroundings of the Happy Arabia—the Atlantic telegraph-cable is actually just about to be deposited in its still oceanic bed. Several different ingredients enter into the composition of this beautiful fabric, as has recently been described. There is copper to carry the message; gutta-percha to confine the same to its intended route; rope-yarn and tar to protect the yielding gutta-percha from the iron gripe of the metallic greatcoat that is firmly twisted round the carrying and insulating core; and the iron itself in its outer eighteen-times sevenfold whorl of tenacious wire. The entire diameter of this composite and multiplied cable is a little more than half an inch; and the diverse substances, with their varying densities, are so apportioned and distributed within these dimensions, that if a mile-length of the structure were hung up in the air, and balanced in some sufficiently capacious pair of scales, it would be found to weigh just nineteen hundredweights. In sea-water, the same length would weigh only thirteen hundredweights, because there the pressure of the water, displaced by its bulk, deducts so much from its downward tendency. The specific gravity of the Atlantic cable is about three times as great as the specific gravity of sea-water.

The weight and density of the Atlantic cable are such, that when it is payed out over the stern of the depositing vessel, it will sink in the salt water, and find its position of final rest at the bottom of the sea. Its weight, however, is not sufficiently great to carry it down with any inconvenient force. The several ingredients of the structure, indeed, have been so selected and adjusted as just to secure the requisite alacrity in sinking, and avoid any dangerous impetuosity in the act. The cable will indeed '*float to the bottom*,' rather than sink. It will be in a measure buoyed up as it falls, first by the static pressure of the water, and secondly by the influence of friction, exerted by the watery particles against the uneven side of the twisted strands of the rope. Some alarm has been entertained lest there should be strain enough to injure the molecular texture of the cable, if five or six miles of its length hang down in the mid-Atlantic, in consequence of the great weight of this extent. The alarm, however, is entirely based upon a misconception of the conditions in which the rope will be placed during its deposition. It will not hang upon the stern of the ship on this occasion; it will be drawn out from it, as the silky filament is drawn out from the spinneret of the silk-worm. Considerable force is used in winding the frail, almost invisibly fine thread of the silk-worm from the cocoon in which the caterpillar has deposited it, when the reels are set whirling to take off the golden cord; yet the fine and frail thread does not break: the force of the revolving reel goes to draw off the silk from the cocoon, instead of to stretch its material. So will it be with the ocean-cable as it seeks its deep-sea repose; the force of its own weight and of the hold which the sea-bottom will acquire upon its strands, will go to draw its protracted length out from the hold of the advancing ship, over the revolving sheaves, and not to pull upon the cohesive grasp of its particles. The vessel will move at a

rate of some four or five miles over the ocean, and the cable will be gently drawn out from behind, and tenderly laid down in the profound recesses of the deep, as if it were still under the careful management of its black-fingered attendants, the tar-begrimed men who have so patiently and assiduously arranged the spires of its growing coil in the yard during its manufacture.

The cable will come up from the hold, as it is drawn out of the ship, round a central block designed to keep its spires from fouling, or interfering with each other as it runs along. It will then be turned over four grooved sheaves, placed one in front of one another, and geared together; and will finally pass three or four feet above the poop-deck, and make its last plunge from a fifth sheave firmly planted by arms over the stern. One of the mid-deck sheaves will also have a friction-drum geared with it, and revolving with about three times its own velocity; the axle of this drum will be gripped, by two blocks of hard wood being drawn together whenever a screw is turned. As the cable runs out, an electrical current will be passed through it from end to end, and will give a signal every second, to intimate that the electrical continuity of the cable remains perfect. At the side of the ship there will be a log, composed of a spiral vane turned round by the resistance of the water as it is dragged through the liquid; this will register electrically the speed of the vessel's progress by making and breaking a voltaic circuit at each turn. The amount of strain actuating the cable at any instant will also be electrically indicated by wheel-work geared with the paying-out sheaves, when the speed of this wheel-work is compared with the speed of the vessel's progress through the water. The wary breakaman will lend a constant eye and ear to the indications of these tell-tale instruments, and while all is proportioned correctly, will leave well alone; but whenever one element is shewn to be acquiring undue preponderance, his screw will be called into immediate requisition, and a compensatory adjustment of machinery made. The electrical logs, and indeed nearly the whole of the engineering arrangements, are due to the ingenuity and skill of Mr Charles T. Bright, a gentleman who was associated to a considerable extent with Mr Wildman Whitehouse in his early electrical experiments and investigations, and who will now be the trickiest presiding spirit of the operations on board the *Niagara*; while Mr Whitehouse sits in the centre of his web on board the *Agamemnon*, in a snug cabin, feeling there the vibrations of his electrical web, and pondering fiery mysteries and subtle things.

Considerable care has been given to the selection of the most auspicious season of the year for the submergence of this wonderful cable. By examining the records of more than 260,000 observations, Lieutenant Maury has determined that between the 20th of July and the 10th of August there is less to fear from either storm, fog, or drifting iceberg, in the mid-Atlantic, than at any other season of the year. The vessels will accordingly be despatched upon their mission as near to this period as will be found practicable. But suppose that, in spite of this precaution, some erratic hurricane—either uninstructed concerning, or indifferent to, the requirements of marine engineering—should encounter the cable-laden ships, and should persevere in its self-willed and vexatious interference with the arrangements of the waves, what does the reader think will be done with the precious rope? It will be simply 'slipped,' as the tempest-caught sailor slips his cable when he is riding in some dangerous and threatening roadstead. Upon the deck of the paying-out ship there are two large auxiliary drums, containing each two miles and a half of a strong supernumerary iron cable, sufficiently stout to bear with impunity a direct

strain of some eleven or twelve tons. In case of need, the telegraph-cable will be cut, and the end of the submerged portion be made fast to the extremity of one of the supernumeraries; this will then be let go, and the telegraph-cable will sink to the bottom of the sea, where not even the most spiteful hurricane can follow it. The strong suspending rope will next be attached, by its upper extremity, to buoys of a peculiarly sharp form, which will be tossed overboard, and abandoned for the time; and the unencumbered vessels will look to themselves, and beat about as circumstances may require, until the storm has passed away; the sharp buoys all the while bobbing up and down in the troubled waves with an easy motion which will hardly affect the treasure plunged for protection to the still depths two miles beneath. The vessels will then return in search of the buoys, pick them up, heave in the suspending rope until the telegraph-cable is recovered, and join the severed ends, and the work of submergence will be resumed as at first.

The Atlantic cable will be stretched from Valentia Bay, in the south-west of Ireland, to Trinity Bay, in Newfoundland—a distance, in a direct line, of about 1884 miles. This is obviously the course in which it has been intended an electrical communication shall be established through the Atlantic, because here the land of the Old World, in the projecting British Isles, and that of the New World, in Newfoundland, jut out towards each other, as if each to seek the other's grasp; and between them, a smooth level shelf is laid at the bottom of the sea, just suitable for the accommodation of an intervening and connecting cord. There are several fine sandy coves in the neighbourhood of Valentia, and the great Skellig Hill, a fine pyramidal landmark, with a light-house on its summit, towers up, a short distance from the shore, to a height of 700 feet. It is not yet determined whether the two paying-out vessels will start away from each other in mid-ocean, dropping the cable between them; or whether it will be paid out in one continuous line from the coast of Ireland to the coast of Newfoundland. The matter is at the present time under consideration. Under either alternative, however, the vessels will proceed in as direct a course from one bay to the other as they can. They would go along an arc of a great circle of the terrestrial sphere, if it were practicable to keep to so finely traced a route; as, however, no navigator, steering by the compass, could accomplish so delicate a task, a track will be taken which will approach very near indeed to a great circle arc. The ships will only change their course six times, and each time the change will be only to the extent of a quarter of a point of the compass; thus they will pass along six sides of a polygon, instead of along a part of a circle; but the polygon followed will practically be so near to a circle, that the track will only measure eight-tenths of a nautical line more than the segment of a circle which would pass directly from place to place.

THE DATE-PALM.

ONE day, an Arab, who had been listening with the greatest interest to a description of the wonderful and beautiful things in England, suddenly asked us: 'Have you many palm-trees in your country?' When told that we have two or three kept at the national expense in a glass-house at Kew, he was filled with the most unfeigned pity for us, and never again expressed either a curiosity to hear about England, or a desire to go there. What is a country without date-trees to an Arab? What can railways and electric-telegraphs, steam-driven looms and gaslights, contribute to the happiness of men deprived of date-trees? Emerald meadows, and oak-forests, and horse-

chestnuts cannot compensate for such a privation. With what do you delight your eyes in a summer's day, when no palm-branches waving overhead temper the stifling air? To what do your poets compare the taper waists of their mistresses, if they have no palm-trees to refer to? 'Now, I can understand,' said our Arab, in conclusion, 'why so many Franks crowd every year to Egypt.'

The date-palm is, in fact, in certain wide-extended tracts of the globe, so essential to life, and furnishes so many of its necessities to their inhabitants, that we need not be surprised if a country where no date-trees grow should have few attractions for them. They look to it for harvest and vintage, and provision for almost all the wants of their simple life. Its high importance is well indicated by the tradition, which relates how the date-palm sprung from the remainder of the clay of which Adam had been formed; in reference to which proverb the Arab prophet says: 'Cherish the date-tree as your paternal aunt.' It is one of the fruits of the Mohammedan paradise; and an Arab proverb asserts that the date-tree grows only in the lands of Islam—a vaunt which, curiously enough, is up to the present day almost literally exact.

A fanciful Arab author, after citing these facts, proceeds to draw a comparison between man and the date-palm, shewing in how many respects a resemblance may be traced, as if to prove their near relationship. 'As man is distinguished from all other living creatures by his erect gait, even so the palm, tall, straight, and limber, lifts its head among the trees. What animal is so beautiful as man, and what tree is so beautiful as the palm among the trees of the forest? In its head is enclosed a substance like the brain in man; if its head be cut off, the tree will die; if the brain be wounded, the branches droop, and the whole tree suffers from the headache. If its branches be cut off, they do not grow again more than the lopped-off human arm. Its head has a hairy covering like that of man. The sexes are separate, and thus a single tree planted by itself is condemned to perpetual sterility. The male palm, surrounded by his suite of females, is likened to a sultan in his harem, and it is even pretended that sometimes in the midst of a plantation a capricious beauty takes an aversion to her lord, and refuses to be fructified by him. She is smitten by the charms of a tree in some neighbouring plantation; then her branches droop from love-sickness, and her head will be seen to turn in the direction of the object of her choice. When a tree thus pines with love, the only cure—and it is found to be always successful—is to tie a bunch of the blossoms of the loved one among her branches.'

No member of the vegetable kingdom has played so important a part in religion, history, and poetry as the palm; not the Egyptian lotus, nor the Celtic mistletoe, nor the French lily, nor the Norman broom. In the Scriptures, in eastern and classical mythology, the palm appears as the symbol of beauty or victory. It was chosen to grace the one day of triumph which our Lord allowed himself on earth; it has been adopted by Christianity to signify the victory over death, the resurrection, its Greek name being identical with the fabled phoenix, which rose again from its ashes. The life of the palm, again, is in its crown, it has therefore been chosen for the martyr's crown, whose guardion is eternal life.

Art, not less than poetry and religion, has drawn its inspirations from the palm. It gave the first model for the colonnades which adorn the temple-architecture in Egypt and Greece; and the most perfect, indeed, of the Egyptian temples is that of Edfon, where the imitation is the closest, and where we behold the palm, with its leafy crown and pendent fruits, reproduced in sculpture. Even the refinement in the

form of the columns, which may be remarked in the greatest works of Egypt, as well as in the Acropolis of Athens—the correction of the error of vision by the introduction of a slight swelling towards the centre of their height—was suggested by the palm, whose stem swells in diameter at a certain height from the ground.

The influence which the palm has thus, from the earliest ages, exercised upon the imaginative and inventive faculties of those who lived within the zone of its growth, is easily intelligible. To the traveller's eye, nature displays no more graceful or majestic scene than a palm-grove; and, considering how such groves are generally situated, we cannot wonder if even the child of nature, though little susceptible of æsthetical impressions, should be deeply affected by the sense of their beauty. He only who has seen it can know the animated joy which the distant vision of the palm-grove wakes up in the wearied traveller's heart. His caravan has toiled for days through the treeless, trackless desert, moving painfully through the hot air-waves all on fire with the sun's rays, surrounded only by dark glassy rocks or yellow sands, which reflect the heat and light in which he is immersed, and produce those premature wrinkles which furrow the forehead and draw together the eyelids even of the youthful wayfarer—sands, again, which burn the foot during the day, or strike an icy chill into the body at night; not a blade of grass, not a thorn, not an insect nor a reptile speaking of life, the monotony being unbroken, save here and there by a few piles of loose stones, heaped up by the piety of preceding travellers, to direct the march over undulating sands as unstable and impressionless as water. When at last a dark spot appears on the horizon, promising shade, water, and probably the habitation of man, all hail the sight: the camels, though unbid, break into a quicker march, the foot-sore pedestrians, forgetting their toils, hasten forwards to reach the welcome resting-place; renewed vigour is infused into the whole caravan; until, on drawing nearer to the goal, the general impatience can no longer be restrained, and the slow march becomes an eager race. No primeval forest affords a cooler shade than the palm-groves of the oasis; the sun-rays do not penetrate through their thick roof, while the slender columns of the trees are open to every breath of air. The palm-grove is life in the midst of death—a world surrounded by chaos. The wind sighs in its branches, the birds flutter round them; the long-tailed gerboa gambols about their stems, and marks the ground at their roots with its tiny footprints. Around are strewn delicate plants, among which coleoptera in endless variety wing their buzzing flight. The noise and fulness of life have succeeded to the stillness of the grave. Oh! as the old Scotch proverb says, 'the sight is good for sore eyes.'

All this, however, is a very small part of what man owes to the palm. He can live without splendid architecture; religion will never be at a loss for symbols; and poetry, allowing it to be a necessary of life, has contrived to find images and ideas of beauty independently of our paternal aunt. But without food man cannot exist; he requires a shelter; he is irresistibly impelled to supply himself with a few luxuries—all these, and more than these, the date-tree yields. Its fruit supplies the most nourishing of vegetable food, alike eatable when fresh or when dried, uncooked or cooked. The fleshy insertion of the young branches into the stem at its crown—in form not unlike the leaf of an artichoke—is eatable, and affords a valuable prevention against scurvy. The white pith of the crown or brain, with a flavour of cocoa-nut, is enough for the dinner of six men. All the domesticated animals—horses, dogs, sheep, &c.—are fond of, and thrive upon, the date. Its very stones, softened in

water, or ground into a coarse meal, are a nourishing food for the camel and the cow. No part of this invaluable tree is useless. The hairs are made into mats and baskets; and the branches of which, according to Herodotus, the Ethiopians made their bows, are now made into crates and many articles of furniture. The branches, again, with their leaves, are used to thatch the roofs and wattle the sides of the rude huts of the inhabitants of the oases; and the lower part of the branch, steeped in water and beaten out, makes an excellent besom. The fibrous substance which grows between the branches and trunk, the *lif*, supplies the Arab baths with a pleasant substitute for the sponge; and it is also twisted into ropes and woven into sailcloth. The trunk itself supplies the best building-wood for rafters and columns, and is said to possess the property of curving upwards, instead of inwards, under a weight. Dear old Plutarch, the only gossip of antiquity who has come down to us, refers to this property of the palm-wood; and he likens to it the true athlete—the athlete in the school of virtue, as well as in that of the Pentathlia, who is borne up and supported, not cast down or bent, by the generous struggle. The whole tree, from its root to the furthest tip of its last branch, is thus serviceable to man. There remains only the sap to be accounted for. This, if the crown be laid bare, will afford daily, during three or four months, a gallon of milky juice, which forms the favourite drink of the Arabs. The first day it is sweet, and in this condition all drink it; the second day, it becomes slightly acid and sparkling, and being now also intoxicating, if drunk in large quantities, the graver sort do not touch it. The third day it is vinegar. This *lagby* is not the only stimulant the palm-tree supplies, for the dates, steeped in water, give a wine, which can be preserved for ten or twelve months, and by distillation, affords a colourless spirit.

A good Arab housewife, besides the sirup—which Herodotus calls the honey of the date, as the Arabs themselves sometimes do at the present day, though its usual name is *dibs* (sirup)—will, for a month together, present to her lord every day a different dish, prepared from the date. This fruit admits of as many varieties in cooking as the French egg or the English potato; but it is more important as an article of domestic economy than either. In Europe, the date is still only known as an article of luxury; but if its valuable properties come to be appreciated, it may be one day as popular among our mechanics as it is with the Arab of the desert. Dates of good quality could be sold in England for about fourpence per pound; and they are more nourishing, as well as easier of digestion, than three times the same weight of bread. The want of such a stimulating food has been felt in our manufacturing districts. The date contains a still larger proportion of sugar than the currant. At the same time, the quantities which could be brought to market, without raising the prices, even if the demand increased, are enormous. The whole valley of the Nile is adapted to its culture; and the line of oases from Egypt to Fezzan is capable of yielding an almost unlimited supply. The date-palm surpasses all other trees in the value, as in the variety of its produce. We had the pleasure of making the acquaintance of an Egyptian gentleman who was formerly at the head of Mehemet Ali's agricultural school. He is the proprietor of an estate near Cairo, to the cultivation of which he applies practically all his theoretical knowledge. He told us that he has in the last few years raised large plantations of date-trees from seed, and that he has already begun to realise larger profits than he had ever expected. It is well known that the shade of date-trees planted round a field is not injurious to its produce; it is the only tree under which the Arabs sow, and the space which its

stem or roots occupy is so very small, that its produce in such a situation may be considered all clear gain. The trees begin to bear fruit in five years, and in fifteen, each will give a clear annual profit of about ten shillings, and in favoured localities, even as much as sixteen. The trees will live for 200 years, and their produce seems to suffer no diminution from age. When the trifling expense of sowing and rearing the tree, and the little trouble the subsequent cultivation of it costs, are considered, it cannot be questioned that the results, in an agricultural point of view, are excellent. Ten trees planted on an acre will not sensibly diminish its yield of sugar, cotton, or grain; but within six years they will most considerably increase the revenue derived from it. The date-tree, as we have already observed, is unisexual, and as in sowing, one must take the risk of having far too large a proportion of male trees, our friend gave himself much trouble to discover some method of distinguishing the sex of the seed before planting it, so as to avoid the loss of room, and the trouble which the unnecessary cultivation of many superfluous males causes. Up to the present time, he had been unsuccessful; but when lately with the regiment, of which he is colonel, in the Sa'id, he obtained from two old men information which he promises to experimentalise upon. They told him that by immersing the seeds for three times twenty-four hours in water, carefully covering the vase, and changing the water daily, the seeds would sprout, and that the sex is indicated by the form of the sprout. Another pretended to be able to distinguish them by the form of the indentation which marks one side of the stone. The strangest and least probable information he received, was on the possibility of changing the sex of the tree by a surgical operation. We suggested to him that a microscopic examination of the stones would probably display a difference of structure, but he said that this would not advance him, since he might throw away the females, and preserve only the males. Experiment alone would answer this difficulty, and an experiment extending over three or four years is too much for Arab patience.

There are known to be at least 150 varieties of the date-palm, each of which has its own habitat, and is found nowhere else. It bears fruit only between the 31° and 18° north latitude, and is injured by the air of the sea; its cultivation ceases at heights where snow falls. The violent rains of the tropics are equally destructive to it. It is a tree calculated for the latitudes where years may pass without a single shower falling. The region of the palm extends from the southern parts of Persia, Mooltan, and the Punjab westward through the whole of North Africa to the Canaries; but it produces its finest fruits in Arabia and parts of North Africa—countries which, without it, would afford no food to man. Hence the extreme value of the variety of its productions. The palm-tree grows in the depressions of those immense plains which form the Great Desert. Here, at a depth of three or four feet below the sand, a light loam is found, which affords it nourishment; and its roots, striking perpendicularly into the ground to a great depth, find there the necessary moisture. Sweet water and brackish are alike favourable to its culture; the salts with which the desert is impregnated do not injure its growth; and without further care than the annual pruning of the branches, it produces fruit. Such fruits, however, though eatable and wholesome, are not, of course, of the finest quality. It is a law of nature, that everything intended for the use of man should reach its perfection only through his toil; and in all the places which are celebrated for the excellence of their dates—the Beled-el-jerid, Siwah, Medina, and parts of Yemen—the proprietors are careful to dress the ground, to water and to artificially manure the trees. But in return for such care—requiring no more

than a single day in each week for a large plantation—the harvest is abundant. One year with another, the date-palm, when arrived at its full growth, produces from 800 to 400—in some few localities, as much as 600 pounds of fruit. The finest of all dates are those of Ibrim on the Nubian Nile. Some of the trees there produce fifteen bunches of fruit, each weighing about sixty pounds, the dates themselves each three inches long. It is truly, as the prophet-king sings, 'a tree planted by the rivers of water, that bringeth forth his fruit in his season; his leaf doth not wither, and whatsoever he doeth prospereth.'

A DESCENT INTO A COAL-MINE

IN accordance with a pleasant and most laudable custom of our age, Mr H. Hussey Vivian, M.P., agreed, in January last year, to give a lecture at the Truro Institution. He chose a subject with which property and its duties have made him familiar—COAL. Coal, in all its relations, geological, commercial, and social or political, he treated in one short discourse with a breadth of view and a minuteness of knowledge highly remarkable and highly creditable. The lecture has been published;* and we select from its many interesting details the following lively account of a gentleman's descent into a pit. It must be premised that it is a South Wales pit.

'Our first operation is to dress: we are furnished with a strong suit of blue pilot-cloth. We ask how it is this dress is all woollen, and we are told that it does not burn, and may be useful in case of fire. We begin to feel uncomfortable, and to call to mind the awful explosions of which we have read. We advance towards the pit, and a man meets us and presents each of us with a *Davy*. We now feel very awkward, but we have said that we know all about a mine, and we cannot shew the white feather. We say, in an off-hand manner, that we suppose there is not an explosion very often. Our conductor stops and reassures us, stating that "there's never been a one since they got the air round; that she has now 90,000 cubic feet of air a minute going through her, split into ten separate columns; that she is swept out in every *goaf* and top-hole; to exemplify which, he will take the *top* off at the furthest point we attain." We express at once implicit belief in the 90,000 cubic feet, and the perfect manner in which the mine is swept clear of gas, and we beg our *cicerone* that he will by all means not trouble himself to unscrew the top of his *Davy* for our instruction. We reach the pit-head: the flat band is travelling at an extraordinary speed; but before we have time to think, up comes the cage with awful velocity; the empty tram is in, the full one is out, and in ten seconds she is away again in the same mad career. In less than sixty seconds, the same operation is gone through; and we now decide on going underground. The cage is at rest, and we hear the words "man going down." "What! you don't mean to say that you expect me to trust my life to that rope, and to the steadiness and nerve of that engine-man? No, I will go by the footway." Our *cicerone* stares; but our coal-mining friend interposes, and says: "Fortunately, there is none. We cannot afford to waste men's lives and health in making them climb ladders; and man-engines, as you are aware, are too expensive for general use. There is no real danger: we change three hundred men a day, and have done so for years without losing a man. The load of coal is five times as great as the load of men, and you will only go down five miles an hour instead of ten." Convinced against our will, we step into the cage, and away we rush down the shaft at railway speed. Our head whirls; we feel a strong pressure on our ears; we hear the guides pass us with headlong velocity; we hardly know whether we are going up or down; and at last a gentle tap, and we are safely landed in a large vacant space, with sidings, crossings, partings, like a great railway-station on a lilliputian gauge. We are led along, and pass trains of trams, some full, some empty, from which a constant stream ascends and descends the pit, and to which trains are continually added. We are struck with

* Truro: Heard and Sons. Pp. 32.

the bustle and order, the stroke of work which is evidently being done. "How much are you raising?" "Oh, we have just got her up to 600 tons a day." Only figure to yourself this vast quantity daily out of one pit and one small space of ground—the active area, the scene of many years' working, being perhaps 200 acres! How splendidly has Providence provided for our wants, by so disposing bed beneath bed, that we are able, with the least possible trouble and expense, to supply ourselves with this inestimable blessing so conveniently and cheaply! We are conducted to a comfortable cabin with seats around it, and we are told to sit down and get our eyesight. Our cicerone proceeds to amuse himself by adjusting the wick of his lamp to the last degree of perfection; and while he does so, we question him a little, and we soon perceive that he is a north-countryman. "How can you extract 150,000 or 180,000 tons of coal a year from the small area of ground you have described?" is our first inquiry. He points to the angle at which the rock is dipping, and says: "We drift across the strata, and thus intersect all the coal-beds. At this level, we have intersected twenty-one beds of coal in a distance of about 600 yards. These are the far-famed lower measures of South Wales; on these, all the great collieries and iron-mines are situated. In this colliery, we have, by drifting, won seventy-two feet of coal, of which sixty-one feet is in beds of three feet and upwards. Every foot of coal extending over one acre, is calculated to be equal to 1500 tons; and, consequently, every acre in this colliery represents 91,000 tons. This is the dim-stock company view of the case, and cannot be realised in practice. Many of these beds are not at present marketable; but they are, nevertheless, coal, and may at some future day be of value. They may work too small; and I know too well," our cicerone says, "how you gentlemen in the west look for *raids*, and how I am blamed if a cargo turns out small. My calculation will shew you how it is that we can turn out so vast a quantity from so small a space. The case of flat measures is different. In my county, Durham, we have to look to the produce of one, or, at most, two seams at a time; and when they are worked out, we must sink deeper; but we often raise 1000 tons per acre from one colliery; and we are enabled to do it solely by the flatness of the strata, which permits us to drive out in all directions, and thus keep as many different districts going as we do different beds in South Wales." "But you say that these beds are not all of equal value: how is that?" "Oh, our friend steps in, and says: 'To a collier, they are all alike, or nearly so. The roof of one or bottom of another may not be quite so good; but, on the whole, anything three feet, or even two feet, and upwards, is workable. But this is a surface-question: one bed may have a roof which adheres to it so closely, that it cannot be detached, and I allow it to be worked and shipped, I shortly hear: 'Why, we have sent me nothing but stones!' Some beds may contain sulphur, and if left in heaps, may ignite spontaneously: we must leave them behind; if not, our friend writes to say: 'Your coal has got rusty as an old horse-shoe, and I have had to keep a man to throw water on it to keep it black.' I say: 'Preserve me from my friend; that bed cannot be worked.' Another is tender, and our friend writes us: 'You have sent me all *slack*.' Another produces too much ash; another is too free, and won't bind; another has a parting in it; in fact, the right thing in the right place in collieries, as in all other matters, is not easy to obtain. You say: 'One has a parting in it: what does that mean?' I thought a bed of coal was solid & homogeneous." "Far from it, my good sir; a bed of coal is rarely, if ever, formed without some separations in parallel to its plane and continuous: sometimes this is but the thickness of a knife-blade; sometimes it is an inch or foot thick; sometimes coal lies on coal; sometimes shale intervenes, and then it is most prejudicial to sale, being difficult to keep out. Instances are known in which this parting thickens to masses of rock many fathoms thick, and thus divides the bed into two." "Well, now," says our stranger friend, "let us hear how you work." "The system of working may be divided into two *uses*—namely, 'Stall and pillar,' and 'Long wall.' The *stall* consists in taking away only a portion of the coal—

say, one-fifth—leaving the remainder to support the roof until the time arrives for working back, when the pillar left is divided and taken away in sections, allowing the strata to fall: when this has occurred, the district is called the *goaf*. Long-wall work, on the other hand, consists in taking a large breast of coal clean away at once. In many beds, this is impracticable; but the opinion is gaining ground, that, when practicable, this system is preferable. In both cases, main levels or drifts are driven, along which railways are laid and maintained until the coal which they command is exhausted. These main levels form also the airways of the mine; but in all well-worked collieries the waterway is kept distinct."

"Our cicerone, who has adjusted the wick of his lamp to his perfect satisfaction, now says: 'I think, sir, we had better be going; you've got your eyesight, haven't you?' "Ay, pick up a needle if you will," and away we go. Our friend bends as if he fears he may hit his head—"Oh, keep your head up." We have seven feet by ten here; this is one of our main airways, and we have something like 70,000 cubic feet of air a minute going through it, and we must have it large. This is our main drift across the strata along it; the air is divided off, and carried into five or six different districts, each of which is thus supplied with fresh air. Each column, after airing its appointed district, is carried to the upcast; each district has at the further extremity a regulator or trap-door, by opening or closing which, more or less air is drawn off from the main or parent column; and thus the wants of the colliery are even and simply supplied. This is the *general* arrangement of ventilation. Now, let me call your attention to the strata. In passing along this drift, we shall traverse 133 noticeable changes in the strata, besides twenty-one coal-veins in 320 vertical yards of ground. The leading type of these measures is *clift*, which, when pulverised and exposed to the weather, turns into mud or clay; but we have also *rock*, which, when reduced to its elements, becomes sand. Interspersed are many beds of ironstone, and under each coal-bed there is a bed of fire-clay; that clay is invariably found beneath each bed both in England and everywhere else where true coal exists, and as invariably contains that curious fossil called *stigmæria*, of which more anon. That which you see in this drift, in relation to the succession of various strata, applies to the whole section of the coal-field, stated to be some 3000 fathoms in thickness. The lower and upper measures, however, contain more *clift* or clay, and the middle more sandstone rock. The coal-measures of all England have much the same characteristics, although known locally by different names. Well, now at length we reach the coal, and stand amazed at its thickness: twelve feet of solid coal; about the height to the gallery of this spacious apartment. The pick rings against it clear and joyful as a marriage-bell—joyful, for if it does not, we betide the shipper, for it is all *slack*, that skeleton in every collier's corner! We are shewn its full thickness, its partings, its cleavage, its holing, its roof, its underclay; its merits are descanted on as those of a familiar friend, and our cicerone with pride assures us that his "elder brother," though only eight feet big, is just beyond, and quite as good or better. Well, we now turn to the right or left along the course of the bed, and we soon enter a *stall* or *bord*. We are shewn how the air is caused to pass up it by means of light wooden planking, called a *brattice*, and then down the other side, sweeping the face of the working as it goes. We find at the end of the stall, which is perhaps five yards wide, a man at work, perhaps lying down, holing for yards under the coal; perhaps kneeling or standing up to cut deep into one side; perhaps boring for his shot. He ceases. Our cicerone takes the pick, raps it, broad side, against where he knows the coal is most solid, and extracts a sonorous ring, with a "Well, Davy, it's all right; coal strong." "Is indeed, master; I never did know it so strong in my life: the price is too little." "Oh, nonsense, man; why, you made your thirty shillings last week." "This is the best man we have got in the pit, sir." Davy grins, and away we go to the furnace. "What! are you not afraid with this enormous fire, that the coal will catch?" "O no; we have airways and counter-arches

to protect it." We cannot stand before it; it reminds us of Dante's description of the infernal regions—a perfect sea of flame and smoke rolling in lurid clouds, we know not whither, and lighting up the darkness; and yet the coal thus consumed does more "duty" than any theorist attributes to it, and the furnace, with its brick-shaft 600 feet deep, amply fulfils its mission. Now, one step into the *returns*, and then to the glorious light of day. We must explain. The returns of a colliery are not its profits. I fear, in many cases, if we attempted to find *them*, we might search in vain, and our search might end, as a colliery without return would surely end, in an "explosion." Well, a colliery's return is its air after it has done its allotted duty; and the pride of a collier is to shew that his returns are not *loaded*—that is, charged with inflammable gas. We go through a door which slams behind us as if it would smash its every fibre. Off goes the top of our ciccone's lamp; we feel queer: his hand shades the flame, and he begs us remark that little or no elongation or halo plays around it. He takes us to a more secluded spot, and with his top on, he shews us a fine thin halo playing round the flame: he raises his lamp—it fills with flame: he slowly lowers it, and says: "Now, sir, if it had not been for Sir Humphry Davy, you and I would now be scorched and blackened corpses." We are quite content with the success of his experiment, and are glad to find ourselves in mad career up the pit, and again on, not in, mother-earth.'

GLASS-ENGRAVING.

On being told that I had come to see glass-engraving, the young man plied his wheel briskly, and taking up a ruby tazza, in a few minutes there stood a deer with branching antlers on a rough hillock in its centre—a pure white intaglio set in the red. I had never before seen the process, and was surprised by its simplicity. All those landscapes, hunting-scenes, pastoral groups, and whatever else which appear as exquisite carvings in the glass, are produced by a few tiny copper wheels or disks. The engraver sits at a small lathe against a window, with a little rack before him, containing about a score of the copper disks, varying in size from the diameter of a half-penny down to its thickness, all mounted on spindles, and sharpened on the edge. He paints a rough outline of the design on the surface of the glass, and selecting the disk that suits best, he touches the edge with a drop of oil, inserts it in the mandril, sets it spinning, and holding the glass against it from below, the little wheel eats its way in with astonishing rapidity. The glass, held lightly in the hands, is shifted about continually, till all the greater parts of the figure are worked out; then, for the lesser parts, a smaller disk is used; and at last the finest touches, such as blades of grass, the tips of antlers, eyebrows, and so forth, are put in with the smallest. Every minute he holds the glass up between his eye and the light, watching the development of the design; now making a broad excavation, now changing the disk every ten seconds, and giving touches so slight and rapid that the unpractised eye can scarcely follow them; and in this way he produces effects of foreshortening, of roundness, and light and shade, which to an eye-witness appear little less than wonderful. The work in hand happened to be tazzi, and in less than half an hour I saw deer in various positions roughed out on six of them, and three completely finished. — *White's July Holiday in Saxony, Bohemia, and Silesia.*

PRESERVING FISH.

Fish may be preserved in a dry state, and perfectly fresh, by means of sugar alone. Fresh fish may be thus kept for some days, so as to be as good when boiled as if just caught. If dried and kept free from mouldiness, there seems no limit to their preservation; and they are much more nutritious in this way than when salted. This process is particularly valuable in making what is called kippered salmon; and the fish preserved in this manner are far superior in quality and flavour to those which are salted or smoked. A few table-spoonfuls of brown sugar are sufficient for a salmon of five or six pounds' weight; and

if salt be desired, a tea-spoonful or two may be added. Saltpetre may be used instead of salt, if it be wished to make the kipper hard.—*Cooley's Cyclopædia.*

'PER ARDUA!'

Nor on the common road
Of life, where thousands with eyes downcast go,
With th' unambitious crowd, return we, slow,
Unprofiting, to God.

But up the arduous steep
Whose summit crown the beauteous trees of truth
And hope, do we, in this our stalwart youth,
Our onward journey keep.

Not idly on the beach
We watch the turmoil of the tossing world—
See strong hearts sink, with bright hopes new-unfolded,
Unaided, in our reach.

But on the angry deep
We earnest toil, to save from its distress
Some drowning soul, if so on earth one less
Sad heart bereft may weep.

Not, cowards, from the fight
Of the torn peoples will we hang aback;
Nor in the strife our arms to strike be slack
For mankind's God-given Right.

But where the spoiler's brand
Sweeps widest, where his heart out-trampling heel
Is firmest set, where Freedom's banners reel—
There will we take our stand.

Not in the blotted book
Of man's false life, where fashion, prejudice,
And selfish greed, have writ their cursed lies,
May we unscorning look.

But by the rays that dart
From Truth's lamp, gain we from the unread scroll
Its wondrous lore, and strive to read the scroll
Of man's mysterious heart.

We would not write on sand
Our names, that when we tread the quays of Time
No more, no manly deed, or thankful rhyme
Shall mark where now we stand.

But we will labour now,
That when we pass to the far Resting-haven,
Our not unuseful lives may be engraven
On a world's grateful brow.

D. L. E.

JEWELLER'S GOLD.

This term is applied to alloys of gold, used for trinkets and inferior articles of jewellery, ranging from three or four carats fine upwards, or which are too inferior to receive the Hall mark. The lowest alloy of this class is formed of copper, 16 parts; silver, 1 to 1½ part; gold, 2 to 3 parts melted together. This is worth only from 8s. 6d. to 9s. the ounce. 'It has recently been found that gold of the quality of 12 carats or less, if alloyed with zinc instead of the proper quantity of silver, presents a colour very nearly equal to that of a metal at least 2½ or 3 carats higher, or of 8s. or 10s. an ounce more value; and the consequence has been, that a large quantity of jewellery has been made of gold alloyed in this manner; and the same has been purchased by some shopkeepers, very much to their loss, as well as that of the public, inasmuch as a galvanic action is produced, after a time, upon gold so alloyed, by means of which the metal is split into separate pieces, and the articles rendered perfectly useless. Gold chains, pencil-cases, thimbles, and lockets, are the articles of which the public and the shopkeepers will do well to take heed, as these have, among some other things, been lately so constructed.'—*Watherston's Art of Assaying.*

SATURDAY, AUGUST 22, 1857.

PRICE 1½d.

OLD STONES.

'NONSENSE! Who on earth would take such a journey—it was forty miles across country, or sixty odd if you went round by rail—'just to see a heap of old stones!'

So grumbled our host, whose 'bark was waur than his bite,' who always said the unkindest things, and did the kindest. Of course, we never fretted ourselves about the matter; we knew we should go.

It had been the dream of youth to us all, indulged hopelessly for—well, I had better not say how many years; since, though to the youngest—now our merry hostess, and mother of our host's three boys—time did not so much matter, we two elders, who had not made quite such good use of it, might possibly be sensitive on the subject. Time? Pshaw! we plucked the old fellow by the beard, and laughed at him, all three of us. He had only made us wiser, and richer, and merrier; we did not grudge him one year out of the many that have slipped away since we used to sit in short frocks, and frilled trousers, and long plaited tails of hair—*à la Chinoise*—in shady arbours, poring over Penny Magazines and juvenile Tours through England—which confirmed us, as I said, in the longing to see Stonehenge, of all places in the world—our 'world' which in wildest dreams extended not beyond the British Islands.

We never had seen it: not though, since then, some of us had gone up and down Europe, till we had come to talk of the Alps and Italy with a hand-in-glove familiarity quite appalling; though to others, the 'ends of the world' had at second-hand been brought so close, that the marvellous Peter Botte Mountain, about which we drank in so many (ahem!) localities in the said Penny Magazine, and Cape Horn, of gloomy horror, and the delicious Coral Islands, in which we so desperately longed to be cast away as wretched Robinson Crusoes, had dwindled into everyday things. Yet still, still we had never seen Stonehenge. As the idea was started, and we canvassed it over the tea-table, the dream of our girlhood came back with the delicious mystery and ingenious conjectures it attended it, and the wild hope—struck out of the faint belief of youth in everything, and, above all, of itself—that if we only once got a sight of it, who cared but that we, actually we! might be the happy individual to set for ever at rest, by some lucky suggestion, the momentous question: Who built Stonehenge?

'A heap of old stones!' We scouted the phrase with youthful indignation; we protested that it had not been the desire of our lives, that we would any of us

cheerfully travel anyhow, anywhen, anywhere to see Stonehenge. Then, like wise women, we let the matter rest; we knew we should go.

Our plan germinated a day or so, in wholesome silence, till we saw its first leaf peering above ground in the shape of a Bradshaw which, quite *par hasard*, our host was apparently studying.

'Oh!' observed he—apropos of nothing. 'It would take a long day—a very long day.'

'What would?' somebody said hypocritically.

'I thought you wanted to see Stonehenge.'

We smothered our joy; we were meek over our triumph; we even—as days were precious to the masculine portion of the household—acquiesced humbly in the proposal that we should 'make a long day of it'—that is to say, from six A.M. to about twelve P.M., including a journey by coach and rail of about 110 miles, if even by that slightly arduous means we might purchase an hour or two among our 'old stones.'

Patience prospered; resignation won. The very next day, we four—three womenkind, on whom, as we have passed the season when we care to be the three Graces, I may as well bestow, *pro tem*, the names of the three Virtues, Faith, Hope, and Charity—under escort of Hope's husband—found ourselves clattering over the stones of our little town, that within two hours fully informed itself of our excursion and plans in all particulars, many of them quite unknown to ourselves. No matter; we were very happy, even when Fate, according to her custom—a wise one, doubtless—dashed our joys, with a pelting rain, which tore us from post travelling and from the breezy heaths—redolent for miles and miles of the apricot-scented gorse—to thrust us into a railway carriage, where we had our choice of being smothered or soaked. Still no matter: not though we had to make a *circumbendibus* which would occupy the whole of the afternoon, and land us in Salisbury just time enough to go to bed: not though the delicious drive across country was put an end to, and we were jolted, and choked, hungry, and wet (likewise dry, very!), labouring under every travelling woe, *except* ill-humour. As we laughed, our troubles lightened; and when, towards dusk, we saw, westward, a red streak peering through the dun sky, and birds began to sing out cheerily in the green, dripping trees, we gloried in all our conquered disasters, for we said: 'It is sure to be a fine day to-morrow.'

And when, opening the carriage window, one of us heard, through the stillness of the rainy twilight,

The faint and frail cathedral chimes
Speak time in music,

we felt, we knew that we were near Salisbury, that to-morrow we should see Stonehenge.

No chance of the cathedral that night; but we saw above the houses its exquisitely delicate spire; and once again, as we sat over the welcome of tea-suppers in the inn-parlour, we caught the chimes, 'faint and frail;' and Hope, who used once to be the most romantic of us all, and in whom even matrimony had not quite uprooted that beautiful weed of the soul, took out boldly her pet poem, *The Angel in the House*, and declared her intention of rising at some unearthly hour next morning, to hunt out the dean's house, where it is supposed the 'Angel' abode, previous to being caught and carried away to the author's. She should find it, she knew, in 'Sarum Close.'

Red brick and ashlar, long and low,
With dormer and with oriels lit:
Geranium, lychnis, rose, arrayed
The windows, all wide open thrown,
And some one in the study played
The wedding-march of Mendelssohn.

Gathering all this admirable evidence for identifying—nothing! we laid our plans, took one peep out on the street, where the pavement glittered, shiny with rain, under the gas lamps, and above a queer black gable, out peered the brightest, softest new moon—we all went to bed as merry as children. Out upon old Time! were we not at heart just as young as ever, and going to Stonehenge to-morrow?

AND WE WENT. I beg to chronicle this in capitals, as a remarkable corroboration of the proverb, 'Wish for a gown o' gowd, and ye'll aye get a sleeve o't;' and to shew that people do sometimes get what they want, if they have patience to wait for it twenty years or so. We went.

It was an exquisite morning; fresh after the rain, breezy and bright, with clouds scudding now and then over the May sun, threatening us just enough to make us feel that we didn't care. It might rain, and welcome—in an hour or two—but we should be at Stonehenge. Even if we saw it—humiliating position!—from under umbrellas, see it we should and would.

So we dashed along the quiet morning street, where the respectable inhabitants of Sarum were just breakfasting, little recking of insane tourists, wild over their familiar 'old stones.' Even our driver, honest man, as he took us through 'the close and sultry lane'—vide *Angel in the House*, which we again referred to—turned round once or twice, with a patronising air, to answer topographical questions, and then cracked his whip solemnly, as if proud that he wasn't so foolish as some people!

Foolish indeed! but it was a holy intoxication brought on by the fresh, breezy, dewy light, bathing the whole spring-world. How beautiful was that world! with the sky full of larks, and the air of hawthorn-scent, with acres upon acres of champaign land, green with growing wheat, waving and shimmering in the sun—a sea of verdurous plenty. How strange, like a bit of ancient history made visible, looked Old Sarum—a perfect Roman camp, with its regular lines and fosses, now thick-sown with trees, amidst which, for centuries back, we learned, still lurked a house or two—no more.

'Yet that place,' remarked Hope's husband, with severe modern practicality—'that place actually, till the Reform Bill, sent two members to parliament!'

We laughed and pondered how much the world had mended since the times of the Romano-Britons, while we walked in a perpetual chorus of larks—a chorus dropping upon us from the white clouds—who sang over us just as they sang over the heads of those grim warriors when throwing up the green walls of Old Sarum.

Salisbury Plain. Familiar as a proverb the place is.

Of a bleak spot, one hears—'As bare as Salisbury Plain;' of being shelterless in the rain—'Might as well have been out on Salisbury Plain.' All images of dreary desolation and flat uniformity gather round it; and one thinks of that celebrated hero of the Religious Tract Society, the 'Shepherd of Salisbury Plain,' with a mixture of sympathy and veneration. Yes, we were now on Salisbury Plain.

A strange place surely. Not flat, as we had expected, but rising and falling in long low waves of land—enclosed wheat-land, for a considerable way; till fences and cultivation cease, and you find yourself in the midst of a vast expanse, lying bare under the sky, as far as eye can reach, in all directions—one undulating sea of intense emerald green. Nothing, except the sea, ever gave me such a sense of solitude, stillness, and desolation, quiet, not painful: nature's desolation is never painful. You hear no birds, for there are no trees to sing in; nay, the larks have ceased, or are heard indistinctly far away over the wheat-fields; an occasional bee alone comes buzzing over the short turf, the flowers of which, dainty, curious, and small, are chiefly of a scentless kind, such as saxifrage, tiny yellow lotos, and primrose-coloured hawkweed. Now or then, every mile or so, you see, lying at anchor in a hollow, or steering across the Plain like a fleet of white sails, whose course you can track for miles, what you know must be a flock of sheep. Or you come upon them close, and the little brown-faced shepherd takes off his cap with a nod and a smile—and his shaggy dog just lifts up his lazy head to look at you: then you leave them all, flock, shepherd, and dog, to a solitude which seems as complete as that of an Arab in the desert, or a ship far out at sea.

And this is Salisbury Plain; and in its centre lies that extraordinary circle of stones, about which the antiquaries prate as they will, nobody really knows anything whatever.

As we ascended and descended ridge after ridge of the waves of land, we all stretched anxious eyes east, west, north, and south. Who would be the first to catch sight of Stonehenge? We scorned to inquire the driver where to look; we felt sure we should recognise it at once; but on we went, and ever many imaginary 'old stones' did our satirical company point out to our eager notice as the veritable Stonehenge.

At last he said, with a quiet air of unquestioning superiority, 'That's it: there are your old stones.'

'Where?'—'Oh, please, where?'—'Yes, where?'—cried in different and yet concurring tones, Hope, Faith, and Charity—the latter being mild even in her enthusiasm: she had seen Mont Blanc and a host of other trifles.

'There!'

'Oh!—Ah!—Well!'

I grieve to confess that these ejaculations were not enthusiastic! Did ever the thing attained seem, in the moment of winning, half so grand as when unattainable possibly unattainable? Nay, as our poetical friend observes—not too politely—of his 'Angel' (the book's corner peered still out of Hope's pocket):

The whole world's wealthiest and its best
So fiercely followed, seemed, when found,
Poor in its need to be possessed,
Poor from its very want of bound.

Alas! whether from the vastness of the Plain, which made the gigantic stones seem small, from the vastness of something to compare them with; or whether youthful imagination had, like 'vaulting ambition, o'erleaped its selle,' and fell prone by the side of ordinary and possible fact—certain it is that nothing but the intense dread of being crowded over by the superior powers of wisdom, prevented our confessing ourselves disappointed in the first sight of Stonehenge.

But afterwards, as often happens, and, let us hope, happened with our poet and his 'Angel,' coming nearer, its grandeur and beauty grew upon us, till, by the time our horses stopped, and drew up under the large shadow of one of the 'Druid (?) rocks,' we descended, silenced by their exceeding sublimity.

It has been described scores of times, this extraordinary circle, or rather series of circles one within another, varying in size, from the outer stones, which are all of silicious sandstone, apparently about fifteen feet in height, and six or seven in diameter—to the inner ones, of granite, and not beyond the size of a man—and the two great centre trilithons, which still stand, erect and uninjured, over the large flat stone of blue lia, which is supposed to have been the sacrificial altar.

These minutiae we neither observed nor heeded then. With an involuntary quietness, unbroken even by the sunshiny wind, rough enough to make hate weigh heavy on our minds and only too light on our craniums, and sharp enough to cause a glad recollection of lunch in a basket—in spite of these human weaknesses, we all felt a certain awe on entering the 'ancient solitary reign' of these great gray stones, upright or prostrate, the mystery of which will probably never be revealed till the judgment-day. We felt rather ashamed to run in and out among them, and measure our height with them—puny mortals as we looked, the tallest of us!—and take hands to clamber over the great fallen blocks, and try to find out which was the identical spot upon which, year after year, the human victim must have lain, taking his last open-eyed fill of the wide emerald plain and blue remorseless sky.

So would romance have dreamed; but Practicality, here predominant, soon set themselves—let me say *himself*—to calculate the height and weight of the 'old stones,' and to invent a plan, by means of levers and earthworks, whereby, without any other machinery, even ancient Britons might have erected the trilithons and the outer circle, in the uprights of which he soon discovered circular tenons, fitting exactly into the mortices carved in the top stones, to prevent their sliding off.

'Clever fellows!' he observed, with the satisfied patronage of modern science. 'Yes, those Druids were very clever fellows indeed.'

I hope their ghosts were gratified, if any still lingered in the familiar temple, supposing it ever was a temple, or that the Druids ever built it at all—all which questions, and many more, we discussed over sandwiches and sherry, incensed by faint wreaths of odour from a weed which modern Britain worships as ancient Briton did the mistletoe, and, *en passant*, under colour of which, probably effects quite as many human sacrifices. Here, though, it was harmless enough; harmless, too, were the jokes and laughter that broke the utter dead solitude of the place, until we dispersed to gather, for ourselves or other folk, moss, bits of broken stone, and dainty wee flowers that perked up their innocent faces under the very shadow of the immemorial stones. Harmless and pretty too was the determined pertinacity with which Hope, bringing out her eternal book, caught Practicality's coat-sleeve, and insisted on reading aloud the idyl *Sarum Plain*, which endeth thus appropriately:

By the great stones we chose our ground
For shade; and there, in converse sweet,
Took luncheon. On a little mound
Sat the three ladies; at their feet
I sat, and smelt the heathy smell—

('There's no heath hereabouts—all turf,' observed Practicality.)

Plucked harebells—

('Nor harebells either. But then it might have been autumn-time,' mildly remarked Charity.)

Plucked harebells, turned the telescope
To the country round. My life went well,
That hour, without the wheels of Hope;
And I despised the Druid rocks
That scowled their chill gloom from above,
Like churls whose stolid wisdom mocks
The lightness of immortal love.

Immortal love! Yes, in this place, this dumb oracle of a forgotten world—this broken, dis-hallowed temple raised by unknown worshippers to a lost god—one felt the need of something immortal, something immutable, something which in one little word expresses the best thing of all good things, human and divine, and which in itself belongs to both; and I think in heart or eyes, visible or invisible, we all had it, and rejoiced in it there.

And now we were going, leaving a small token of affection in the shape of a paper of biscuits, and a neckless, though not quite wineless bottle, to two of the aborigines, who had appeared from nowhere in particular, to meekly maunder about the stones, and offer us specimens, but who retired abashed before we could get out of them a syllable of conversation. But just ere departing, we saw, half a mile off, winding slowly across the Plain towards us, a mysterious machine, half-wheelbarrow half-peepshow, with a man behind it—at least a big hat, which indicated a man underneath.

My good man—when you stopped, and in that business-like way, took out your sketch-book, plans, curiosities, and laid them out in a sheltered nook, and began to lecture, in the most intelligent fashion I ever heard from any cicerone, on the antiquities of Stonehenge—you little suspected that one of those three innocent-looking ladies would ever put you down in print! Not that I think you'll have the slightest objection to it, Mr Joseph Browne of Amesbury—'twenty-four years attending illustrator of Stonehenge,' as your guide-book says (price one shilling, and worth two, for its extraordinary amount of intelligent fact and even more intelligent fiction). You are a great character, and long may you live to startle tourists with your apparition, and enlighten them with your discourse—a condensed edition of your guide-book, or rather, your father's. *Literatim*—behold its title!—

THE UNPREJUDICED, AUTHENTIC, AND HIGHLY-INTERESTING
ACCOUNT

WHICH THAT
STUPENDOUS AND BEAUTIFUL EDIFICE
STONEHENG
IN WILTSHIRE,
IS FOUND TO GIVE OF ITSELF.

Therein is proved, to the author's satisfaction at least, the undoubted origin of Stonehenge. How it was the work of neither Romans, Celts, Druids, nor Phœnicians, but of antediluvians! How though, as the writer allows, 'the difficulty in determining the situation of the abodes of those antediluvians who were concerned in the erection of the Serpent and Temple at Abury, of Silbury Hill and of Stonehenge, is very considerable,' he brings a mass of evidence, wanting in nothing but a few slight premises to start from, and proves that the giants that were before the Flood could alone have erected the stones, and the Flood only could have thrown them down. Of these antediluvians, their manners and customs, and general goings on, domestic, social, and religious—'of the earnest desire that existed in Adam to perpetuate a knowledge of original sin,' which he did, in all probability, by the erection of a great serpentine temple—qy. at Abury?—'that hieroglyphic being fully adequate to so momentous an end'—likewise of the

Deluge, and the course of its waters, 'running as they are known to have done, from the south-west to the north-east'—our author speaks with a decision, confidence, and familiarity quite enviable.

Nevertheless, despite one's smile at the ease with which 'facts' can be accumulated into a great cairn of evidence over the merest dead dust of a theory, which a breath would blow away, one cannot help appreciating the exceeding intelligence and antiquarian ingenuity of both Henry Browne, senior, and Joseph Browne, junior; and all visitors to Stonehenge will miss a great treat if they do not invest a shilling in the guide-book, and one or two more in the acute explanations of the guide.

We did so; left him beaming with satisfaction, and bowing till the big hat nearly touched his knees—in manners, at least, our friend might have taken lessons from his favourite antediluvians—then we rolled slowly over the smooth soft turf, often looking behind till the great gray circle lessened and lessened, and finally dropped behind one of the green ridges.

'You can't see it any more.'

'I wonder if we ever shall see it any more.'

Charity 'was afraid not'; Hope thought 'she should like to bring her boys here, when they were old enough to understand it'; Faith—did what Faith always does, and let the question bide. One thing, however, was certain, that we should, in all human probability, never be all here again as now. In mortal life are renewals, but no repetitions—no 'second' times. Each pleasure, as well as each pain, stands by itself; and though the new thing may be ten times better than the old, still, it cannot be the very thing—that is gone for ever, as it is right it should go.

We knew well—and in spite of our laughter, I think we felt—that though we might all live to be old men and old women, and see many grand sights up and down the world, we should never again have a day exactly like this our day at Stonehenge.

'Well, do you want to see any more "old stones"?''

Of course we did. We had not dragged our benevolent Practicality all that distance from his home and work to let him off with anything short of the utmost we could get. Besides, some of us, rising early, had already given glowing descriptions of what, not having seen, I shall not attempt to paint—Salisbury Cathedral and Close, under the aspect of seven A.M. and a sunshiny morning. And some others of us had, from the first dawning of the plan, set our heart with a silent pertinacity which is not often beaten in anything, on seeing all that could be seen and told about the said cathedral. So, after a few carnal but not unnecessary arrangements at the inn with reference to lamb and asparagus, we sallied forth again into Sarum Street—a quaint pretty old town it is!—and passed under the heavy gateway which shuts out from the world the quiet sanctities of Sarum Close. We

Breathed the sunny wind that rose
And blew the shadows o'er the spire,
And tossed the lilac's scented plumes,
And swayed the chestnut's thousand cones,
And filled our nostrils with perfumes,
And shaped the clouds in waifs and zones,
And wafted down the serious strain
Of Sarum bells—

Not exactly yet, as it was before service-time. Otherwise the picture was just as we beheld it that 26th of May 1857.

Of all English cathedrals, perhaps Salisbury most merits the term 'beautiful.' Its exquisite lightness, whiteness, and airy grace, set in the midst of a wide and open Close, sometime turf, but now one golden ocean of wavy buttercups, and belted in by a square walk, where chestnut and lime trees of thickest, vividest foliage overhung the path, and half-shadowed

the old houses and small bright gardens—its glittering windows and flying buttresses, up from which one's gaze wandered to the most delicate of spires, that tapered up till it vanished into nothing in the brown blue—I feel it is impossible to describe—I can only shut my eyes and dream of—this first vision of Salisbury Cathedral.

We sauntered slowly along the path through the buttercups; how much better than a field of tombstones, as it was for centuries, till bold Bishop Barrington on one momentous night sent an army of workmen, who before daylight had levelled the whole, laid each tombstone carefully over its proper grave; only—four feet below the surface, instead of upon it! How the good people of Salisbury must have stared, and stormed, and been scandalised; but the deed was done, and could not be undone; the turf grew green, the dead slept quietly and unharmed, and ceased to be, what providence never meant them to be, though man has tried hard to make them—a burden, a terror, or a destruction to generations of the living. Now, there are no more burials in Salisbury Close, and very few even in the cloisters.

Passing through the nave to the chapter-house, we entered these cloisters. Others, elsewhere, are grander—Gloucester, for instance—but here, again, I doubt whether any can compete with Salisbury in beauty. This covered cloister-walk encircles a space open to the sky, with, I think, only two yew-trees planted in it. The verges told us that the late bishop took great pride in it; and after his wife was buried there, would not allow even a daisy to mar the exquisite green of the turf, but paid old women to go and pick them every morning! His three family tomb-stones are the only tombs allowed: over all the other graves are tiny tablets, let into the level grass; and so narrow in the space, that each grave is dug coffin-shaped. We could trace still, in one or two places, the known outline which, however familiar, humanity never looks upon without a certain awe.

We entered the chapter-house, which—better than any monumental tomb—is being restored, by subscription, to this late bishop's memory. Here, again, the exquisite airiness of Salisbury architecture struck us. This great lofty circular chamber—chapel almost—entirely supported by one centre pillar, or rather cluster of united pillars, from which all the arches spring. You stand under it as under some slender palm-tree, and look up wondering at its aerial lightness, its ineffable grace. Nor, even when overpowered by the extreme ornamentation of the 'restored' building (one of us suggesting that the restorer had better have left it alone, was quite annihilated by the verges—'Indeed!—you think so, madam!'), does this sense of that unity and simplicity which constitute a perfect form of beauty, ever pass away.

'Rather different from Stonehenge. Quite a variety in old stones,' observed our escort, after examining and recognising the Purbeck marble and pavement of Minton's tiles—admirable modern imitations of the antique.

Yes—it could not fail to set us pondering how

The One remains—the many change and pass.

The ONE, whom Shelley knew not, or knew so dimly; whom, ignorantly and blindly, all earthly generations have, in divers manner, striven to adorn in all manner of temples—from these rude stones of Stonehenge, so placed that the sun, rising in his place upon the longest day—and only then—shall strike through the gateway, on to the sacrificial stone—on this fair cathedral, on which the devices of man's brain and hand, through six hundred years, have been lavished, to glorify in material shape the Immortal, whose glory the whole earth and heaven cannot contain.

We trod lightly, as instinctively one treads on what must ever be regarded as consecrated ground. We heard the many traditions of the place—saw the usual cross-legged, broken-nosed Crusaders; the boy-bishop who, in the midst of his murmurings, ate himself to death—poor little rogue! was buried with all canonical honours, and whose tiny effigy may be seen to this day; the skeleton-monk—who still lives in stone, to impress beholders with a wholesome terror of mortality and corruption. With these wonders, and a score more, we regaled our curiosity; till a few figures, quaint and quiet, such as one always notices in cathedral towns, entered a little door, and stole, prayer-book in hand, along the nave, towards the choir—while over our heads—far up, as it were—the service-bell began to toll dreamily and slow.

We had no time to stay longer; so, out into the open air! through the door at the great west front, which we turned back to look at; and, though quite unlearned in church architecture, stood marvelling at its rich decorative work, endlessly varied, over which a little bold happy sparrow ran up and down and in or out, as if the whole of Salisbury Cathedral were made for him to build his nest in. Thence, slowly round the Close, in one corner of which a group of boys were just quitting a game of most unsanctified cricket, and disappearing hastily either for school or prayers; out through the gateway, leaving the bell still ringing, and the clouds still floating over the airy spire—the May winds still rustling the chestnut trees, and waving the buttercups, and the sunshine glorifying into almost unimaginable whiteness and beauty Salisbury Cathedral.

Finally, home; in the cool of the day, travelling right across country, a country purely English; skirting parks, where the trees stood, one by one, majestic pyramids of green, with their branches sweeping the very ground; past rich fields, dotted with red and white cows, ruminating in the grass, or standing knee-deep in a pond, too lazy to do more than turn to us the mild, calm, sleepy gaze, whence Homer calls Juno 'the ox-eyed;' through quiet villages, where children and old women gaped at us out of open doors, where every cottage had a porch, and every porch was a mass of woodbine or China roses. A drive not easily to be forgotten, in the lovely pictures it gave of one's own country—one's modern, everyday living and breathing England, which, with all her faults, we fondly believe to be

Beloved of heaven o'er all the world beside.

Finally, as I said, home; to find the children fast asleep; and sit for an hour or so over a quiet fireside, talking over all our doings, which will serve for talk still, when we are all gray-headed, and the 'little ones'—probably six feet high—may be taken—I beg pardon, may take themselves—to see Stonehenge.

'Well, have you, on the whole, enjoyed your "Old Stones"?'"

I should rather think we had!

KIRKE WEBBE,

THE PRIVATEER CAPTAIN.

CHAPTER IV.

To speak, to think of dinner at such a moment was revolting, insufferable! The callous animalism of the privateer captain annoyed, disgusted me, and I flung out of the house in a hot rage. The wind, I found, had increased to a gale—the ships at Spithead had sent down their upper spars, in preparation for a dirty night; and so piercing was the blast, that it took the wine-fire out of my blood in a very short time, and I was enabled to take a cool dispassionate view

of Captain Webbe's assumedly frank, confidential, straightforward communication; the result being to deepen, rather than efface, the feeling of mistrust with which I had listened to it.

I do not know that I could have given any very logical or lucid reason for that mistrust; but I had, notwithstanding, a strong impression that he was seeking to hoodwink, bamboozle me, and to carry out a purpose widely different from the ostensible one. Yet, except that he imagined it possible to palm off a daughter of Madame de Bonneville for the lost Lucy Hamblin—an altogether wild, insane project, of which it was really absurd to suspect so cool-headed a man—I could not see what sinister purpose he could have in view.

Then my mother, who had known him so many years, confided in his good faith, if with some misgivings, and commanded me to do the same. It was imperative, consequently, that I should not suffer myself to be discouraged by shadowy dangers, having no existence, possibly, save in my own imagination. Concluding, therefore, to place heedful confidence, so to speak, in the privateer captain—to follow his leading boldly, and with both eyes wide open—I returned to the hotel.

Captain Webbe had finished his dinner, proclaimed by his rosy gills and generally placid aspect to have been a satisfactory one. I apologised for having so abruptly left him.

'My dear boy, the loss was yours, not mine,' replied Mr Webbe. 'Besides, it is a common failing in the morning of life, when the blandishments of passion take the reason prisoner—I forget the exact words of the quotation, but the practical moral is, that inexperienced youth is prone to attach a higher value to imaginary raptures than to the sober reality of a southdown wether-leg, done to a bubble—a weakness which the strong years never fail to cure. A glass of wine with you, Master Linwood.'

'Willingly; and now, perhaps, you will have the goodness to sketch, and with as rapid a pencil as possible, the action of the all-important, all-compensating last act you speak of?'

'Certainly. Madame de Bonneville, *ci-devant* Louise Féron, exclaimed upon catching sight of me—she has about the sharpest pair of eyes I know of: "Le Capitaine Webbe! Est-il possible!" Now, Captain Webbe, whether in French or English, is not a name to be ashamed of, but there is a time and place for all things—even for picking up stones, as I learned at school—and certainly the month of November 1813, and the street Dupetit Thouars, St Malo, were not the suitable time and place for so shrill a proclamation of that respectable name. Instantly, therefore, entreating silence and a word in private, I followed her into the *magasin*. A few minutes sufficed to establish mutually amicable relations; and circumstances detaining me in St Malo longer than I feared might prove beneficial to my health, we became mighty intimate.

'As a proof of that friendly intimacy,' continued Captain Webbe with a grimace, as if half-a-dozen invisible surgeon-dentists were operating upon him at once, 'I may mention that Madame de Bonneville, not having quite sufficient capital for her business, declared that she preferred being obliged for the trifle required—five thousand francs only—two hundred pounds sterling—to her old friend, Captain Webbe, than to her nearest and dearest relatives! It was withal a mere bagatelle, as she said; for which bagatelle, counted out in solid five-franc pieces, le Capitaine Webbe received in acknowledgment and acquittal: "O that you are good! O that you are generous, my dear captain!" and a laugh,' added Webbe with a savage snap of his teeth that would have taken a piece out of a pewter-pot—'a laugh which said as plainly as laugh could,

"You will take skinning more pleasantly, my dear friend, when you are more used to it!"

Unquestionably genuine was the wrath which flashed from under the scowling brows of the privateer captain, and bitted in a concluding execration! He could not, then, be plotting with the Frenchwoman!

'It was subsequent to the exaction of that pledge of amity that I first saw Clémence de Bonneville, and detected the imposture at a glance.'

'Or imagined you did!'

'To the devil with imagined! The pretended daughter has a clear fair skin, bright silken hair, sweet blue eyes, and a delicately moulded, sylph-like figure. De Bonneville's complexion is the colour of mahogany—her hair, raven-jet, and coarse as horse-tails; her eyes, black as a thunder-cloud; her person, large, bony, angular! The girl is an English girl—is the lost Lucy Hamblin. That conviction, fire would not burn out of me.'

'I trust there are better proofs of that than contrasts in features and complexion.'

'There are abundance of proofs, and I rely upon you to obtain them. Now, don't fly out till you have heard all. Clémence, as we may as well continue to call her, is, please to understand, one of the simplest-hearted, most guileless of maidens; and expressions which have escaped her, when I have by a rare chance found her alone, satisfy me that she has in some way discovered, if not the exact secret of her birth, that she is not the daughter of Madame de Bonneville, of whom she stands in terrible awe; and who, by the way, intends marrying her to one Jacques Sicard, a relative of madame's, and a well-enough-to-do master-bootmaker.'

'That marriage,' continued Webbe, finding I made no remark, 'still remains in madame's programme, which in other respects has been lately entirely changed. It was, and not so very long ago, her intention, after Clémence had become Madame Sicard—not before—to open negotiations with Mrs Waller, who, she is aware, cherishes the memory of her lost child as tenderly as ever.'

'Nothing more than proof of Clémence being that lost child—unchallengeable, overwhelming proof, is required for my father's effectual vindication.'

'Quite true; and the knowledge of that has, no doubt, powerfully operated in finally determining Féron—she has no legal right, I am positive, to the name of De Bonneville, and Féron she shall be to me—in finally determining Féron, I say, never to take a step that might lead to such a result. Cupidity might, however, have conquered hate; but a closer view of the possible consequences to herself that might follow the avowal that Clémence was the child alleged to have been drowned, has irrevocably decided her never to make that avowal.'

'Really, Captain Webbe, I can scarcely follow such a labyrinthine maze of strange facts and stranger inferences. What frightful hazard would the woman incur by the restoration of Mrs Waller's child?'

'The hazard of being sent to the galleys—that's all. Féron must have falsified the municipal register of baptism, to which offence the *code pénal* attaches that tremendous penalty. What surety would she have, now that peace is about to open France to the English, that Linwood, for example, might not set the law in motion against her? Then the woman has acquired a respectable position in St Malo, and has a decided objection to losing caste, and much more beside, as she would do, were she to acknowledge that her pretended daughter is a child stolen from English parents. That she will never do: the question is decided.'

'What, then, will she do—does she propose doing?'

'I will tell you in a few words. She has ascertained for herself that the Wallers are still wealthy, that Mr Waller is extremely anxious that his daughter should

return to England, and reside near him; that Mr Linwood is rich, and pines to embrace her son; that that son himself is consumed with an irrepressible longing to return to his native country—to slowly die there, as he in his morbid despondency of mind believes. Well, Louise Féron, if paid very—very handsomely for doing so, will continue to withhold the evidence that would, as she declares, convict your father; Mr Waller can have his daughter to reside near him; Mrs Linwood may again embrace her son; and that son may return to die slowly in his native country—favours to be enjoyed by Louise Féron's sufferance—and revocable, of course, at her pleasure!'

'And how is this woman-fiend to be encountered—baffled?'

'By the exercise of courage and cunning equal to her own,' replied Webbe, throwing away his cigar, and continuing to speak with an energy and earnestness very unlike his usual sneering cynicism; but whether feigned or genuine, I was too little versed in the science of dissimulation to determine.

'The great point is,' said Webbe, 'to make sure that my surmise—we will call it a surmise—relative to Clémence is well founded—to ascertain beyond dispute that she is indeed Lucy Hamblin.'

'That will determine everything.'

'Unquestionably; and fortunately the lost child has, I am pretty sure, some indehible natural mark, which will render its identity indisputable. Your grandmother will tell you what that mark is—I do not wish to know it—and when you have been furnished by me with an opportunity of applying that infallible test, and you are satisfied that Lucy Hamblin is Lucy Hamblin, we shall be free to take such steps as prudence, courageous prudence may advise. If we are foiled, it will be your fault, not mine, depend upon it.'

'How will it be my fault?'

'Madame de Bon— Louise Féron, I mean, intends leaving St Malo immediately after she can manage to get there from Guernsey; and will be absent on business affairs in Paris for at least three weeks. Clémence will be left to the guardianship of Fanchette, a sort of half-servant, half-friend, and wholly contemptible, yet kindly, gossiping old soul. Now, the *Scout* will be in the Thames at the latest, I hope I may say, on Wednesday evening next; you will embark in her for Jersey, whence you and I will easily pass over to St Malo.'

'Pass over to St Malo! Really, that is a very startling proposition. Suppose, now, my companion and guide, Captain Webbe, of the *Scout* privateer, should be recognised by some person or persons, whom two hundred pounds sterling, counted out in solid five-franc pieces would not bribe to silence—how then?'

'That danger must be risked—confronted. Your mother expressed great confidence in her own courage.'

'I hope to justify that confidence; and it is surely no proof of courage to shut one's eyes to danger! But go on with your plan.'

'Arrived at St Malo, where, for various reasons, my own stay will be brief, I shall introduce you to Clémence and Fanchette with a flourish of trumpets that will insure a gracious reception. Thereafter all will depend upon the use you make of your opportunities. To avoid the possibility of being duped, which would not suit my book any more than yours, I would simply ask Fanchette if she knows of any natural mark upon the young lady's person, and if she does, to describe it. Supposing, however, that I am mistaken, and that no such natural mark exists, there is another mode of at least achieving our purpose—the vindication of your father's character. There, then, I think, be no question that Louise Féron, with a view

to all probable and possible eventualities, took care to preserve some of the child's clothes or ornaments: a pearl necklace I remember hearing the little Lucy had on when she went out on the 18th of August with her traitorous governess; now, if you can manage by bribery, or by any other expedient, to obtain possession of any article we can prove belonged to the child, Louise Féron's hour will have struck, and I shall take care she knows that "ce cher Capitaine Webbe, who will take skinning more pleasantly when he is more used to it," set the hands, and swung the clapper! You will have means of direct communication with me," added Mr Webbe; "and when matters are ripe, I will manage to bring you both safely to England."

'How is it, Captain Webbe, I suddenly exclaimed, 'that you have not given your own son the chance of wooing and winning the guileless and susceptible Clémence? The value of the prize, in only a monetary sense, supposing her to be, provably, Lucy Hamblin, would have been great.'

The privateer captain laughed out with gleeful good-humour.

'That, my shrewd young friend, was the game I did intend to play, and bitterly vexed was I at being thwarted in it. My precious soft-headed son had, I found, fallen extemporaneously in love with the pretty face of a penniless wench, one Maria Wilson, or Blison, whom he had met with in Jersey; and it was quite useless to attempt, I found, stirring such a dish of skimmed-milk with so gallant a purpose! You will have an opportunity of making his acquaintance, as he will go with you as far as Jersey. We will now be going,' added Captain Webbe, ringing the bell; 'I shall be early to-morrow at Oak Villa: night brings counsel; and I will not doubt that I shall find you thoroughly resolved to engage in the task confided to your filial piety and courage. Good-bye.'

I found my excellent relative quite recovered from the nervous shock occasioned by the unexpected apparition of Louise Féron. She had read my mother's letter, and she listened with flashing eyes and glowing cheeks to the recapitulation of my long conferences with Captain Webbe.

Her eager, minute cross-examination, if I may call it so, having at length obtained from me every word uttered, every peculiar gesture or intonation I could recall to mind, she thus oracularly delivered herself:

'You must not hold back, William, from the venture, very hazardous and slightly promising as it may be. But I have no confidence in Webbe—and do you have none—or at least only so much as deeds, unequivocal deeds, will justify. I always suspected him of being a confederate of Louise Féron's—perhaps unjustly; or he may have quarrelled. I have seen his son—a mild, limpid lad; a masculine type, as far only as person goes, of his meek-minded mother, and the very opposite, consequently, of Kirke Webbe. Lucy Hamblin had an indelible natural mark, which will render the fraudulent substitution of another child impossible. But I don't know what it is; and Mrs Waller, whose mind has never quite recovered its once healthy tone, must not be excited by Webbe's strange story, till some proof of its authenticity has been furnished. Obtaining by hook or crook a sight, and if a sight, possession of the pearl necklace, or some recognisable article of clothing, is a good idea; keep your eye upon that. As to your engaging yourself in marriage, why, I dare say, William, the notion of marriage had never—but of course it had not at twenty—occurred to you before. The notion, I say, of such a thing, till the young woman is introduced to you by Mrs Waller herself, as her undoubted daughter, is absurd, quite preposterous; it throws an air of unreality over the whole thing. Still, I do not renounce against the truth of Webbe's story, because

it is in parts absurd, confused, improbable. All true, but incomplete narratives are necessarily so, from the absence of modifying facts and connecting-links. Fiction, on the contrary, is always coherent, plausible. Yes, my dear boy, you must act according to circumstances, with boldness and discretion; above all, with discretion. I do not mean by discretion, timidity or hesitation. You must boldly grasp the nettle danger, it has been wisely said, if you would pluck therefrom the flower safety. True; but you must also be wary and circumspect in deciding upon the fitting time and mode of making that bold grasp. It is a heavy burden, a fearful responsibility to lay upon one so young, so inexperienced in the ways of men; still, it must be. You have courage, zeal, a holy cause, and are not, I think, deficient, for your years, in common sense. I will see Webbe in the morning, and arrange that you shall have frequent communication with me. I shall also add considerably to the reward which your mother has answered for, in the event of success. Such a man can only be bound to our interest by golden fetters, of which there must be no stint.'

After the foregoing fashion did my worthy grandame untiringly discourse or soliloquise, till, becoming aware that I was nodding indiscriminate assent to her dicta, she, with some petulance, exclaimed that it was time for boys to be in bed, and sharply ringing the bell, desired Nancy to bring Master William's chamber candlestick!

I was 'Master William' with the venerable lady, I may here pause a moment to remark, when she, having passed her ninety-fourth year, fell calmly asleep in the arms of her already gray-haired grandson, on the evening of the 10th of July 1840, faintly ejaculating, whilst a seraphic smile played about her thin white lips: 'The clock must be wrong, Master William, for, see, the dawn is breaking—bright—beautiful—divine!'

But more than a quarter of a century of life lay between her and that supreme hour when, on the Wednesday following her Sunday-morning encounter with Louise Féron, I left Oak Villa for London, taking with me her blessing, a well-filled purse, and several foolscap sheets of closely written counsel, adapted to all conceivable exigencies. Webbe had gone the day before to Portsmouth upon business connected with his American prize; but I should find him either at his private lodgings, High Holborn, or on board the *Scout*, which, from the direction of the wind since Monday morning, he had no doubt would reach the Thames before either he or I did.

I arrived in London on Thursday afternoon about five o'clock, and seeing by the shipping news in the papers that the *Scout* had brought up a little below Greenwich, I lost no time in getting on board. My arrival was hailed with great satisfaction by Captain Webbe, as the tide would soon be on the turn, and he was anxious the *Scout* should sail that evening. He was in the cabin taking a parting glass with his son, and chief officer, Mr Robert Dowling.

'Pressing business matters, Mr Linwood,' said Captain Webbe, as he filled me a stiff tumbler, 'prevent me, I am sorry to say, from accompanying you to Jersey. I shall, however, manage to meet you there before many days are past.'

'That is, I suppose,' remarked Dowling with something of a glum look and tone—'that is, I suppose, if the *Scout* don't happen to bring up in a French port instead of Jersey.'

'Is there any fear of that?' I hastily exclaimed, glancing as I spoke at the pale, handsome face of young Webbe, upon which fear, if I did not misjudge him, was strongly marked.

'I don't know about "fear,"' gruffly replied Dowling; 'but the fact is—'

'Of course you don't know about "fear,"' interrupted

Captain Webbe; 'nobody supposed you did. *Le Renard*, a French war-brig,' added the captain, 'whose commander is supposed to have a spite against us for balking him some time since of a valuable booty, sighted the *Scout*, it seems, as she came up Channel, and Dowling fancies she may overhaul us on our way to Jersey. Not at all likely; and if she attempts to do so, the *Scout* can shew a fine pair of heels'—

'Heels be ——!' broke in Dowling. 'Don't fancy, captain, that because you won't be on board, we shall'—

'*Chut—chut!* Clap a stopper upon that foolish gab—do,' again interrupted Webbe. 'Let's on deck,' he added; 'it's time I were on shore, and you off.'

A shore-boat was alongside, into which Webbe presently jumped; the capstan was manned, and sent round with a stamp and go; the anchor was brought home, and in less than five minutes, I should suppose, after we left the cabin, the *Scout* was dropping down the river, helped with a light air from the northward.

By dawn the next day we were off Margate, and the wind freshening, the *Scout* made swift progress. The day was clear and bright—a wintry brightness—and it seemed that we were to have a pleasant, uneventful run. Whether from the effect of the sea-breeze, or the non-appearance of *Le Renard*, Harry Webbe's fine, if somewhat feminine features had assumed a rosier, healthier hue; and his conversation shewed him to be a well-informed young man.

As the day declined, the sky became overcast; the wind rose and blew in fitful gusts, sometimes of great violence, though of brief duration; and I heard Dowling consult Withers, the officer next in authority, as to whether it might be advisable to bear up for Guernsey. It was, however, decided that the *Scout* should hold on her direct course, passing between the French coast and the islands of Alderney and Sercq. Cherbourg was passed; the race of Alderney was speedily run through; by the time evening closed in, we were beginning to slip past Sercq; and Mr Dowling's apprehension of meeting with *Le Renard* was passing away, when the look-out on the foretop sung out: 'Sail, ho!'

'Where away?' queried Dowling, snatching up his glass, and hastening forward.

'Right ahead!' was the reply; and sure enough a large gun-brig—six fierce teeth a side—hitherto concealed from us by Sercq—was standing directly across the *Scout's* course.

'*Le Renard!* by all that's lucky!' exclaimed Dowling, as he closed his glass with a snap. 'Turn all the hands up, Withers,' he added, with stern promptness. 'There's a hot supper, quite enough for every mother's son of them, just ready, so they had better look alive, or they'll not have time to ask a blessing before falling-to.'

The tap of the drum, as in a man-of-war, beat to quarters, the men tumbled up the hatchways, and after one quite sufficient glance at the stranger, addressed themselves with a will to clear the *Scout* for action.

'Is a combat inevitable?' I asked, addressing Mr Dowling.

'Why, no, young man,' he replied; 'we are not obliged to fight, though, as it happens, we can't run. We might knock under at once—haul down the jack flying at the fore, and be carried off comfortable and quiet as Quakers to Cherbourg. But the "Scouts" not being Quakers, it's my candid opinion, since you ask me for it, that if you, in an hour or less from this, ain't gone to glory, or upon the road to it, you'll be uncommon lucky; and besides that, will have something to talk of for the rest of your natural life. Luff!' he roared through his trumpet to the men at the

wheel. 'Bring her nose dead to windward. We must lie-to, or, by jingo, the dance will begin before our music is ready.'

THE ATLANTIC TELEGRAPH-CABLE AT WORK.

WHEN the Atlantic telegraph-cable is once securely lodged on its shelf at the bottom of the sea, messages will be transmitted through it from shore to shore of the great oceanic basin, by causing a current of electricity to flow from one end to the other of the included copper strand, and then to produce certain observable electrical effects upon its arrival. A surprising amount of ingenuity and skill has been expended upon the preparation of the apparatus by which this result will be obtained.*

The primary source of the electrical power which will be employed in this service—the fount whence the stream of electrical telegraphy will issue—is a voltaic battery of singular excellence and gigantic power. There are first ten large cells of gutta-percha, strengthened outside by a wooden casing, and filled inside by a mixture of sulphuric acid and water. Into each of these cells project a number of *laminae* or leaves. The *laminae* are composed of platinum-covered silver and mercury-amalgamated zinc alternately; but all the zinc leaves are connected together beneath by a long metallic bar; and all the silver leaves are connected together in a similar way by another bar above. Thus, all the silver element acts as one continuous plate, and all the zinc element does the same. Each metal exposes in one cell of the battery 2000 square inches of surface to be operated upon by the acid. The battery is thus composed, in electrical language, of ten pairs of voltaic plates, each having 2000 square inches of silver, and 2000 square inches of zinc, exposed. The zinc and silver elements of each cell have been arranged in separate *laminae*, instead of in one extended plate, because by this management it has been made possible for any portion of the acting plate to be removed for renewal or repair without there being the need to stop the activity of the battery for even a single instant. So long as this process of renewal of the corrodible zinc plate is carried on, the giant battery will maintain itself continuously in unimpaired operation. The battery is the invention of Mr Wildman Whitehouse, and well deserves, after his name and its own unrivalled characteristics, to be called 'The Whitehouse Perpetual Maintenance Battery.'

This Atlantic battery is of exceeding power when its electricity-generating energies are allowed to come into unimpeded play. The *wires* by which the contacts are made between its poles, are broad fourfold straps of sheet-copper, and will ultimately be twisted ropes of copper. When contact is made and broken between these straps, flashes of mimic lightning play between them with brisk crackling snaps. If one is pressed upon some iron tool, while the other is drawn firmly down a sharp ridge or edge of the metal, the edge is smoothly cut away, just as if a file had been powerfully drawn three or four times over the angle. If the two straps are pressed down upon the end of a pair of pliers, or upon a thick iron screw, half an inch of either being included between the ends of the copper straps, the included iron becomes red-hot, and begins to burn with the emission of a shower of sparks in five seconds. The quantity of electricity generated by the plates of this large battery produces this powerful heating effect when it is thrown upon a small mass of such an excellent transmitter as iron is.

* *The Atlantic Telegraph. A History of Preliminary Experimental Proceedings, and a Descriptive Account of the Present State and Prospects of the Undertaking.* Published by order of the Directors. Jarrold and Sons.

Quantity and intensity, or motor energy, in electrical matters are, however, by no means identical things. though the current set going by this battery is powerful enough to produce the heating effect described in it is thrown upon a substance not offering much resistance to its passage, it is altogether unable to force its way through any body that does offer any considerable degree of resistance. If the frame of a living man being, for instance, be made to assume the place of the screw, by one of the polar copper straps being fastened in each hand, previously moistened, not enough of the current passes through the arms and chest even to produce a thrill when contact is made and broken. The electrical current that burns up the iron screw in a paper, cannot force its way through four or five inches of flesh and blood. Yet a real lightning flash which had not a hundredth part of the battery-induced current in it, so far as *quantity* is concerned, could penetrate by virtue of its superior *intensity* enough that flesh and blood in the fraction of a moment, and reduce them to lifeless ashes. The great driving power of the Atlantic battery is inconvenient on one sense, on account of the transmission of the current having necessarily to be made through a make and break key of metal. The electrical current eats its way through the portions of the metal at each passage with a sharp spark and a loud snap, although the key is composed of thick brass springs, and an iron angle, not a foot long; and so threatens to be continually deranging the mechanism of the commutator by its sparking propensities. This spark-difficulty has, however, nearly disappeared in the hands of the cunning Prospero who wields the rod of electrical magic. Mr Whitehouse now leaves a small curl of fine platinum wire constantly in circuit between the two poles of the rancorous monster—the platinum is too tough a morsel to be disposed of; it cannot be eaten up like iron. But would be kept at an intensely red or white heat, if it were not prevented by further contrivance. The curl of platinum is kept in a vessel of water, and the water goes to make the water boil, instead of to make the wire red-hot. A wreath of steam is continually rising from the hissing liquid. When this 'perpetual steaming apparatus' of Mr Whitehouse is at work, as an appendage to the 'perpetual maintenance battery,' a spark appears on making and breaking the circuit of the key. There is a perpetual slight electrical leakage on through the platinum wire, which in no way interferes practically with the full stream through the copper straps, when the complete contact is made. The leak, then, merely serves to absorb into itself the redundant and mischievous spark, and so protects the mechanism of the key from harm. The ten-celled battery employed at each terminal station of the Atlantic telegraph line, will be sustained in steady activity at a cost, for consumption of acid and zinc, of about one shilling per hour.

The electrical current of superabundant quantity which is generated in this perpetual maintenance battery of 20,000 square inches of excited surface, is, however, the agent which will actually traverse the wide ocean. It has been found upon experimental trial that voltaic electricity is at the best but a lazy and sluggish traveller. On this account, the voltaic current is simply employed to generate a fresh force at home. It is strictly but a *generating* current. It is thrown upon a new piece of ingenious apparatus, consisting of coils of silk-covered copper wire, wound round a long bar of soft iron. There is about a mile and a half of the wire, and this wire is a continuation of the metallic plates of the battery. The current induced in the battery courses round and round through the coil, and so engirdles the soft iron bar any times in succession. But the coursing current makes the iron bar a magnet for the time, and a very powerful one too, on account of the multiplying turns

of the long coil. Within the wire coil, and also surrounding the iron bar, another coil of much finer silk-covered wire is rolled. This wire is many miles long, and after being wound almost a countless number of times round the bar, it goes off into the strand of the Atlantic cable. It has no metallic communication, indeed, with anything else. Now, as the generating current, issuing from the battery, makes the soft iron bar into a magnet, so the powerful magnet, by mere sympathetic influence, or induction, as it is termed, calls up an independent stream of a new kind of electricity in the second finer coil, and this current flows forth through the cable from one coast to the other of the wide ocean. It is the real *transmission* current; that which goes forth ready girded and bound for the arduous journey. The instrument which receives the battery current is thus properly a double-induction coil. Electricity induces magnetism, and magnetism induces electricity, which differs in character from the primary generating influence in the fact that it is of inferior *quantity*, but of very much higher *capacity for speed*. This magnet-induced electricity comes forth from its coil as a thoroughly equipped fleet messenger, prepared for the effort of leaping across the Atlantic in the fraction of a second of time. In practice, there are two large coil-magnets, each five feet long, placed side by side, because under this arrangement each magnet proves to be a support and a helper to its companion and neighbour. Each, by the mere influence of propinquity, makes the other stronger in its magnetic energy, and thus enables it to induce so much the more vigorous transmission current in the investing coil.

But it is not even the transmission current which will ultimately effect the telegraphic signals. When this current has made its way across the Atlantic, it will naturally be weak, and, in a measure, exhausted by so long a journey; consequently, instead of being set to hard work in this weary state, it will be received in a nursery or infirmary, and have its worn-out vigour recruited and renewed. The transmission current will operate upon a receiving instrument of great ingenuity. The continuation of the conducting strand of the cable will, on the other side of the Atlantic, be curled into a coil, and this coil will surround a horseshoe-shaped bar of soft iron. The current, when flowing through the coil, will make the iron bar into a temporary magnet; and the poles of this temporary magnet will be reversed according as it is a current from the positive or negative pole of the transmission apparatus that flows through the coil. Between the extremities of the temporary magnet there will be a small permanent magnet traversing on a pivot, so that its north pole may be attracted to, or repelled by, a corresponding pole of the temporary magnet. In this way, the permanent traversing magnet will jerk to the right or to the left, accordingly as the giant voltaic battery on the other side of the ocean is made to send a positive or a negative transmission current through the cable. The weakened transmission current will, notwithstanding its own debility, render these magnetic movements comparatively brisk and strong, because it will course many times round the iron bar in its coil, and each time repeat the same influence and call up the same addition of magnetic energy in the iron bar. It will be the old trick of twenty men on the stage making an army a thousand strong, by marching round and round, behind and before the scene. There will be but one current, but the iron horseshoe will feel as if there were a myriad, because of the one running round and round. Now, when the permanent magnet traverses one way, it will complete a circuit, and open the electrical flood-gates of a small local voltaic battery near at hand. That fresh battery, its flood-gates being opened, will set to work, and print or

record a signal on paper prepared for the occasion. When the permanent magnet traverses the other way, the circuit will be broken, the flood-gates of the local battery will be closed, and the printing will be stopped. Thus the hand which holds the break-key on the west coast of Ireland, will, by this complication of inductive influence, make the small permanent magnet on the shores of Newfoundland open and close the outlet of the printing-battery stationed there near at hand. When the winch of the break-handle is turned to the left in Ireland, the battery in Newfoundland will print; when the winch is turned to the right, the battery in Newfoundland will be inoperative and still.

The printing-battery performs its work by the agency of a recording instrument, which consists of a ribbon of paper slowly and evenly unrolled from the inside of a hollow cylinder by means of clock-work, and of a sharp style, which indents a series of dots or lines upon the paper as it unrolls, when magnetically directed to do so. When the style is pressed down *for an instant*, as the paper is dragged along beneath, a *dot* is marked; when it is kept down for a little more than an instant, a prolonged trace or *dash* is left. The style itself is held up by a spring when not at work; but beneath the style there is a soft iron bar, which becomes a magnet whenever a current of voltaic electricity is sent from the printing-battery through a coil curled around it. The temporary magnet then draws down the style to make its dot or dash, accordingly as the case may be. When the soft iron bar is an electricity formed magnet, it is stronger than the spring, and pulls down the style upon the paper; when it ceases to be a magnet, the spring comes into play, and lifts the style up, so that the paper traverses beneath it without a mark. The style is held down an instant or longer, accordingly as an instantaneous or a longer voltaic current is passed through the coil surrounding the bar.

The dot-and-dash code of telegraphic communication is an invention of Professor Morse of the United States. It is a very important contrivance, because it enables complete words to be spelled out when there is but a single wire to transmit the signals through. Different arrangements of these two elementary signals can easily be made to symbol all the letters of the alphabet, and the several numerals to boot. Thus, a dot and a dash signify *a*; a dash and three dots, *b*; a dash and dot once repeated, *c*; and so on. The clerks who are engaged in reading these signals, become so expert in their occupation, that they can close their eyes, and tell what the message is that is being telegraphed, merely by the clicking sounds of the style. They get to understand *the speech* as well as *the writing* of their instruments.

It has been already remarked, that one of the most extraordinary circumstances connected with the working of the Atlantic telegraph apparatus, is the very trifling electrical power which proves sufficient to transmit intelligible signals through long extents of the cable. In an experiment made since the first allusion in our Journal to this subject, Mr Whitehouse was working with 1000 miles of the cable, and succeeded in spelling words through this length by a battery consisting only of two minute fragments of zinc and silver, excited by a single drop of brine suspended between them. When one drop of water and a fiftieth part of a square inch of zinc can electrically spell out a word through a distance equivalent to half the breadth of the wide Atlantic, there need not be any doubt entertained that the leviathan laminated battery, with its 20,000 square inches of zinc, and many gallons of acidulated water, will be quite equal to the task of doing the same thing through the entire breadth of the ocean-basin. In 1851, Professor Morse said the Atlantic would one day be crossed by a telegraphic cable capable of transmitting electrical

messages; in 1857, the prophetic seer, in all human probability, will enjoy the gratification of witnessing the fulfilment of his bold prophecy.

ST VITUS.

'Now, the faith of St Vitus is not the faith of the Church of England, nor, in faith, do I well know what faith it is; but the Ordinary took no objection to it.' These are the words of one of England's best and greatest humorists—of poor Tom Hood. There is not a saint in the calendar whom I like more. This very 15th of June is his especial day. I dare say that in more parts of the world than one a miracle will be performed by the Sicilian saint upon this day. Why not? Did he not, when about to perish in the persecution of Diocletian, in the year 303, just as he bent his head to the sword, pray that all afflicted with the dancing mania, that horrible madness, should be cured if they prayed to him; and did not a voice—from heaven, say pious believers—respond: 'St Vitus, thy prayer is answered.' If all this did not happen, then the Abbot Hildusoinus of St Denys, the Abbot Warinus; the authors of the *Acta Sanct. Jumi*; of the *Annales Ecclesiasticæ*, are all lying—under great mistakes. Is not St Vitus the patron saint of Bohemia? Has he not, for certain, two bodies—one in the cathedral of Prague, and the other at Parma; not to mention two second-best bodies at St Denys and Cervery, as above?

But of this humour of dancing, which St Vitus undertook to cure—what of that, my masters? Humanity, poor thing, has been visited with various mani furors—tulipomania, South-sea mania, railway mania, and hundreds more. By these it tried to make money; but the dancing mania is the strangest, simplest, most unmoney-making mania ever heard of. 'We read in Spondanus,' says Waddington, the church historian, 'that in the year 1374, there arose in Belgium a sect of dancers, who paraded the streets, entered houses and churches half naked, crowned with garlands, and dancing and singing, uttering unknown names, falling senseless on the ground, and exhibiting other marks of demoniacal agitation.'

Peter de Herentals—an old gentleman with whom I have a very passing acquaintance—tells us one of the words—a frisky word—that they shouted out; perhaps our adjective is derived from it.

'*Frisk friskes cum gaudio clamat uterque sexus, cunctus manutergio et baculo connexus.*' Shouting thus, these poor fellows and lasses danced everywhere. They first danced it at Aix-la-chapelle, then at Liège, at Utrecht, at Limoges, through Tongres, at Limburg, then on to Cologne and Metz. Jumping, stamping, pirouetting; scuffle, shuffle, in and out and down the middle; join hands, gavotte, chassez forward, and set to partners—a polka, a polonaise, a Highland fling, a gallopade and a fandango. 'Are you out of breath, my lady?—nay, I trow not.' A saraband, a minuett de la cour, a waltz, and a clog hornpipe. The peasants in their sabots danced the latter feebly enough. Their wives danced the bolero, the cacacha, the Tarantula; the spider bit them on purposes, as you shall hear. Hopping, popping, never stopping, bundling, trundling, whirling in and out; merchants, peasants, noble men, and noble ladies, a few priests, who went off in the midst of their prayers to St Vitus; students dancing the college hornpipe; house-wives and nurses, military men and grave magistrates. Chassez, croisez, pousette, and doe-à-doe, balancer, and chaîne de dames, on they went; the musicians being tired out, fresh ones were supplied; dancing, ever dancing, the mania spread like a plague. Idle lookers-on were affected, and joined; the very city-guards threw down their halberds, and jigged it with the rest; the judges and barristers bowed gravely, and

began the first germ of a minuet de la cour; the hangman cut his double shuffle; and the jailer, throwing down his keys, joined the prisoner in a hornpipe in fetters!

All this is a matter of history. Peasants left their ploughs, and every one else his or her occupation. Girls and boys ran away from home, and servants and apprentices joined in the wild scene. The spasmodic disease spread like a plague. The patients leaped like deer over stools, tables, and chairs; they danced on without stopping, till dead or cured. 'Felix Platerus tells us of a woman at Basle who danced for a whole month together,' says old Burton. Music they loved, and the magistrates in Germany used to hire musicians, and also sturdy fellows to dance with them. By the year 1418, the dancing-plague had reached Strasbourg, and for many, very many years, periodical attacks of the mania returned again and again. The priests used to pray to St Vitus, and to throw cold water over the dancers; they would also beat them with sticks, and read the Gospel of St John to them. It was not until the sixteenth century, that Paracelsus, a great man, greatly misunderstood, began to explain the causes of this mania, and to lay down certain rules for its cure. Theophrastus Bombast, or, as he called himself, Paracelsus, struck a deadly blow at the miracle-mongers—for which he now suffers in fame—by first denying that the saints had anything to do with the infliction or cure of this mania. 'We will not admit,' says he, 'that the saints have power to inflict disease. We dislike such nonsensical gossip, as is not supported by symptoms, but only by faith, which is a thing not human, whereon the gods themselves set no value;' that is to say, superstition, for it is that kind of faith which the *Sieur Theophrastus* designates. He then proceeds to classify the St Vitus's dance: First, From imagination (*chorea castiativa*); second, from sensual desires (*chorea lasciva*); third, from corporeal causes (*chorea naturalis*). His method of cure was, with one exception, eminently sensible and modern: low diet, fasting, solitary confinement, being made to sit in uncomfortable places, till misery and pain cured the laughter and jiggling desires, immersion in cold water, and even severe corporeal chastisement.

Paracelsus—and our admiration of him does not blind us to the fact of his being slightly a quack—then enumerates many quintessences and nostrums which are not of the slightest use. Probably these were intended to work on the faith of the patients. Certainly when once the doctor stepped in, and the priest stepped out, St Vitus lost his power; his shrine shewed a decrease of visitors. Howling, hopping women and girls, and whirling artisans, no longer flocked to him upon St John's day, nor did the priest bring forth the holy-water and St John's gospel to banish the plague. The fifteenth and sixteenth century saw the gradual decline of St John's dancers; and in the commencement of the seventeenth, the thirty years' stand-up fight between the Protestantism of the north and the superstition of the ultramontanists swept over Europe like a purifying fire, and the belief in domestic house-plague devils, and especially the devils whom St Vitus banished, died out and lost its power.

Protestant Germany being saved, there yet remained Italy and Spain for M. le Diable to dance about in. He had already placed himself in communication with the good people thereof; but, determined to go to work in an original way this time, he dismissed St Vitus and his agency, and took up with a little spider called the Tarantula.

Have you ever seen Señora Perea Nena dance the Tarantella? Have you ever been in sunny Spain?—I use the adjective out of deference to everybody else who has used it. Have you ever seen the peasants there, or the Rouman, the gipsies, twirl themselves in a fantastic way, shaking their legs as if bitten,

beginning slowly, but increasing wonderfully, till, after a maddening saltation, they fall exhausted? If so, you have seen the last successor of St Vitus, the illegitimate imitator of the devil-spider, the suggester of that Rabelesian Rhapsody of Hood which I quoted in the commencement of this paper.

But lo! shall I write upon an insect and not quote Linnæus? Has that famous naturalist nothing to say about the spider? Does he not give us the habitat of the *Aranea Tarantula*? Yes doth he; he tells us that it is found in Austral Europe, in Apulia, Barbaria, Tauria, the deserts of Southern Russia, in Astracan, and in Persia. It was formerly believed, says he, to excite a desire of dancing which could only be cured by music; but that its bite was seldom dangerous; that its eyes are red, its body covered with black concentric rings; and that, excepting in these particulars, it is very much like other spiders.

I do not find that the Tarantula dancers differed much from the St Vitus disciples. When first bitten, if everything related be true, they would appear to have fallen into a state of melancholy, and to have lost possession of their senses. This continued till they heard the Tarantula music; upon which, they sprang up shouting for joy, and danced on without intermission until they sank to the ground exhausted and nearly lifeless. Some men were afflicted in another way. A few glasses of wine will make one man merry and another sad. So with the Tarantula. Some were melancholy mad, and wept and pined away with an unsatisfied longing, an anxious misery, a worn-out morbid craving desire, in which they died. Dancing was, however, the rule—continual dancing, perpetual toe-shaking, limb-quivering, back-breaking exercise. To read the old chronicles, one would believe that throughout the fifteenth and sixteenth century, nothing but one long quadrille prevailed in Italy. Moreover, the dancers abhorred or loved certain colours—red they disliked, or liked, with a mad-bull fury—and so were gay or sombre as the case might be.

A certain Capuchin friar of Tarentum jiggied it so wonderfully, pirouetting, and setting to corners, flinging, twisting, making cheeses, and hornpiping like any dervish, that Cardinal Cajetano, who half-suspected him to be a humbug, proceeded to the monastery to witness the performance. Of course, the visit ended as all such visits do end. Going out for wool, we weak mortals usually get shorn. Enthusiasm would cease to be enthusiasm were it not catching. The dancing Capuchin danced it finely—balanced himself upon one leg like Cerito, shook the other like Elslar, and then performed certain mad pranks as gracefully as old John Reeve, dressed as Cupid, dancing upon a theatrical sunflower. When he saw his spiritual prince clothed in purple, he made a dash at him; he disregarded the music of the Tarantella, and sighed only for the cardinal's cape. He swooned upon being driven away, and the piteous cardinal gave up the cape, whereon the friar, throwing it over his shoulders, danced as if possessed of a love-frenzy, and Cajetano went away a firm believer in Tarantism.

These spider-dancing people liked water, and had an irrepressible desire for the sea. Some old songs yet remain, expressing their love for the deep, the vast, the ever blue, the deep, deep sea:

Allu mari mi portati
Le soletti che mi sanati
Allu mari, alla via:
Allu mari, allu mari:
Mentre campo, faggio amari.

But, after all, the only thing to cure them was the Tarantella music. Villages sometimes provided the musicians, and more than one benevolent lady is mentioned who spent her whole time in visiting the sick, and her whole fortune in providing music for the

dancers. Some of the favourite tunes are yet preserved, to which Tarantula patients, from the boy of eight to the old gentleman of ninety-four, performed their saltatory extravagances. It was in its greatest force in the seventeenth century; towards the end thereof, it died off.

Of course, Tarantism, as a real disease, has been denied *in toto*. Certain it is that a spider might bite you or me, good madam or sir, and we should not go off into the exercises *affore named*. We wait till bitten by an advertisement of dancing taught to adults by Madame Devy. We only exhibit our madness in a private way, or when we go out in obedience to those delightful cards of invitation which tell us that evening-dress is required. Apprentices, milliners, shopmen, and young barristers shew off this inflection in public; and a most ridiculous sight it is. I saw a whole theatre full of people so afflicted the other night, but then it was at a public ball, and I must say I enjoyed the scene. There are gentlemen who say that the spirit which called all those people together, was demoniacal.

Tarantism being dead, it became expedient for the dancing-demon to employ himself otherwise. He did so in France in 1727, when the convulsionnaires, praying at the tomb of the Deacon Paris, were seized with that disease from which they took their name. Their dancing was scarcely so much real pirouetting as that of the St Vitus disciples. Tetanic spasms and convulsions distinguished these attacks; mad wishes of standing upon their heads, the ladies used sacks sewn up at the bottom to cover their feet, and other extravagances, distinguished these fanatics. The numbers increased so much, that about the year 1735, the king ordered that no more miracles should take place at the Deacon's tomb, and the cemetery was closed, whereon the following epigram, slightly profane, you will say:

De par le Roi, défense à Dieu
De faire miracle dans ce lieu.

Pinault, the advocate, who barked like a dog, was a convulsionnaire; and Arouet, the father of that arch-sceptic Voltaire, visited a celebrated lady-patient who barked also. The insanity of these poor creatures lasted till the year 1790—not a very proud thing to say of the enlightened eighteenth century.

Eighteenth century, quotha! Have we not disciples of St Vitus now? Do not the Turkish dervishes dance in Cairo and elsewhere? Does not one sect of Jumpers, founded in 1760, exist still, and do not the members of that sect worship heaven by dancing, like David before the Ark? Has not America also its Shakers? Do they not banish marriage as a wicked, wretched institution; but do they not also dance, even dance in their devotions? Do they not also swoon and dance, and faint and throw themselves into convulsions at their camp-meetings? There is little new under the sun. What has been will be again: we may have Corybantes and Bacchantes *rediviva*; and since people now-a-days give the lie to Galileo, and believe in the wildest miracle-monger, I, for one, would not say but that the neglected shrine of St Vitus may yet have a fresh batch of votaries.

THE CHEMIST.

You have heard, have you not? of 'Philosopher's scales'—Well, somewhere—'twas neither in England nor Wales—Lived the cousin of this most remarkable man; I will tell you about him as well as I can. He by trade was a chemist; he studied at schools Where the science was taught by infallible rules; He knew the prognosis of every condition, But his forte, beyond doubt, lay in *decomposition*. Analytical tests he had ready at hand, Which no compound has ever been known to withstand;

The elements soon were of union bereft,
And nothing but 'simplex materia' was left.
I'm sure you'd have thought it exceedingly droll
To see what a change he produced in the whole;
For bodies that sparkled and glistened before,
When the process was over, were sparkling no more;
And things dark and dingy, when once they were tried,
With the beams of Apollo in brilliancy vied.
Such, indeed, was the charm of this magical fusion,
You'll be tempted to deem it an optic illusion;
But I'll leave you to judge with the facts in your view,
For I'll warrant you'll find them undoubtedly true.
When we went to him first, he was trying with care
A powder he said was exceedingly rare:
'Humility' called—as he viewed it again,
'I will test it,' said he, 'with a drop of *Disdain*.
Now, if it is pure, to the bottom 'twill fall,
And you'll see that it will not be altered at all.
But if not, 'twill so violently vapour and fume,
You'll all make a rush to get out of the room.
Stand still, if you please, sir.' No sooner 'twas spoken,
Than with hissing and fizzing the bottle was broken.
Said the chemist: 'I feared 'twould not stand the ordeal.
The counterfeit 'a commoner far than the real.'
Then, taking it up, nothing more did he say,
But he tore off the label, and threw it away.

Next a pigment was brought him of beautiful red—
Of qualities splendid and grand, it was said;
An antidote sure against tempers too pliant,
And a pigmy it soon would transform to a giant.
'High Spirit' 'twas marked; but our friend whispered:
'No—

That may be its name in the regions below;
But I strongly suspect you will find, when it's tried.
'Tis much the same thing as in heaven they call *Pride*.
Thus many are often misled by a name.
It differs in form, though in nature the same.
However, we'll test it. When genuine, we find
It combines with the essence of Greatness of Mind.
But if it is spurious, we usually trace
In the salts that it forms, that Self-love is the base.
Look! the Spirit is floating like oil on the top;
And the Essence is sinking, see, drop after drop;
And the colour is gone—the black dust that remains
Is the sublime *Pride*—you may see how it stains.
You noticed how quickly the fluid displaced it:
'Tis a virulent poison; you'd better not taste it'

Next, a substance was brought looking much like
earth,
Which we quickly pronounced of no possible worth;
But our chemist his crucible nicely prepared,
And we watched most intently to see how it fared.
With exquisite caution, he tempered the flame,
As hotter and hotter the furnace became;
Then with one gentle breath, he extinguished the fire,
And we thought that his labours in smoke would expire.
But he searched in the ashes ere yet they were cold,
And produced to our view a residuum of gold!
We looked at each other in silent surprise,
And weighed it before we could credit our eyes;
But it stood all our tests; and with blushing that
We owned we were wrong, and the chemist was right.
Yet surely we ne'er were so baffled before,
For covered with dross, who would dream of the ore!

But to tell you of all that came under review,
Your patience would tire, and my memory too;
Still, a fact here and there you shall have in possession,
For those who may study the chemist's profession:
He shewed by experiments certain and sure,
That *zeal* not combining with *love*, was impure.
'By those who are novices yet in the trade,'
He added, 'mistakes are too frequently made;
Thus, 'tis found that an ore looking like *Self-denial*,
Turns out to be only *Self-love*, upon trial;
And *Frivolity*, known as an extract of *Mirth*,
Often passes for more than its currency worth;

While a substance, less sparkling, but really more bright,
 He precipitate, Happiness, many will slight—
 Taking the first, till astonished they own
 The volatile essence in vapour has flown.
 Thus you see, my dear friends, that the labour of
 Learning
 May all be comprised in the skill of discerning.

Alas, me!' he exclaimed, as he rose to depart,
 A sorrowful feeling oppresses my heart,
 When I think how the good is in error concealed,
 When I think of the evil that lies unrevealed;
 And often I sigh for that glorious day
 Which shall purge all the reprobate silver away;
 Or though the Refiner, in time of His ire,
 He dross shall consume with unquenchable fire,
 Yet gathering His jewels with exquisite care,
 He will save the least atom of gold that is there.
 Hope on; for I see the morn break through the gray—
 The shades are departing: all hail to the day,
 Then fresh from the furnace, untarnished and pure,
 The incorruptible Truth shall for ever endure!

GEORGE STEPHENSON.

WARDS the close of the last century, there resided the colliery village of Wylam, some eight miles from Newcastle, an individual named Robert Stephenson, by vocation a fireman to one of the colliery-engines. He and his wife Mabel occupied a part of a small two-ried house—still standing—with unplastered walls, y-floor, and naked rafters; let out in portions to urers at the neighbouring pits. Here, according to the 'recheester' in the family Bible, was born, on 9th of June 1781, Robert Stephenson's second son, orge. The family afterwards grew to six in number, Robert and his wife sometimes found it difficult to ke ends meet out of an income of twelve shillings a ek, with provisions at war-prices. When all ordy expenses were paid, there was not much left to ote to clothing, and nothing to the schooling of the kren. George's mother was a woman of delicate ith and nervous temperament, subject to 'vapours;' his father was far from being robust. His er's engine-fire was a favourite resort of the s and girls of the neighbourhood, who used to wd round it on evenings and half-holidays to listen some strange adventure of Sinbad or Robinson soe, which he would relate to them; or, better l, to some story of his own invention. He was d of wandering in the fields, and went bird-nesting summer-time; and in winter, had a flock of robins ich he had tamed sufficiently to come hopping nd him, and pick up crumbs at his feet. When rge was eight years old, the family removed to ley Burn, another hamlet a few miles away. en there was so little coming in, and so many utils to fill, it was necessary that the children uld be set to work at as early an age as possible; George was set to look after a neighbour's cows, I keep them from straying, at an income of two- ee a day. The lad's mind, even at this early age, ot idle; for he made reed-whistles, and clay- nes with hemlock steam-pipes; but not to the lusion of his bird-nesting propensities. Quitting ow-minding after a while, he was set to lead es at the plough, hoe turnips, and do other farm- rk at an advanced salary of fourpence a day. But height of his ambition at that time was to get ployment at the colliery, and this he obtained after hile, still with an increase of earnings, first to pence, and then to eightpence a day. He was soon oved to another colliery two miles off, and set to ve the gin. This went on for several years, George

passing much of his leisure time in taming black-birds and attending to his rabbit-hutch—a great bare-legged laddie, full of fun and tricks. At fourteen years of age, he was appointed assistant-fireman to his father, at a shilling a day; but soon after this came another family removal to Jolly's Close, a few miles further south. The family were all at work by this time, the lads at the pits, and the girls assisting their mother at home; and the united earnings enabled them to live more comfortably than heretofore. When George was fifteen, he obtained a situation as fireman on his own account; and his wages were after a while advanced to twelve shillings a week, an event which he announced to his fellow-workmen with the exclamation: 'Now, I'm a made man for life!'

It was a proud day for father as well as son when George was appointed 'plugman,' and his father fireman to the same engine; although the former was considered the higher post of the two. George now devoted himself to the study of the engine under his care, taking it to pieces, cleaning it, and putting it together again, so that he soon acquired a thorough knowledge of its method of working and construction. He was eighteen years old by this time, earning full workman's wages, but not yet able to read. His duties occupied him twelve hours a day, so that his leisure moments were few. His mind was fully bent on learning to read, for he found that the knowledge he was in want of was unobtainable otherwise. So he began to attend a night-school three evenings a week, to take lessons in reading and spelling; and practised making pothooks, so that by the time he was nineteen he was able to write his own name. After this, he took to arithmetic, in which he soon made great progress, working out his sums while tending his engine, and having fresh ones set him each evening. In the course of time, he was appointed brakesman at the Black Callerton Colliery. His wages were now nearly a pound a week; but not satisfied with this, he turned cobbler, and mended his fellow-workmen's shoes; for he had fallen in love with pretty Fanny Henderson, a servant at a neighbouring farm, and was saving up towards housekeeping. Fanny's shoes, as it happened, wanted mending; so Geordie must try his hand at them. He could hardly bear to part with them after they were mended, but carried them about with him in his pocket for some time, pulling them out now and then, and gazing fondly at them; and doubtless, when obliged to give them up, taking his payment out in kisses. It was here that he saved his first guinea, declaring himself to be a 'rich man' when he put it away. On Saturday afternoons, instead of going off drinking with the other workmen, he always made a point of taking his engine to pieces for the purpose of cleaning it. Although he would never accompany his comrades in their drinking-bouts, he was fond of joining them in the performance of feats of agility, in which, as in most other things, he excelled. He was not without pluck either, as he proved by the thrashing he gave bully Nelson, the terror of the village. His school-education still went on in winter evenings, till he had advanced so far in arithmetic that the master could teach him no more. Still saving up, by degrees he amassed sufficient money to enable him to furnish a small cottage in a very humble manner; and this being done, Fanny and he were married in November 1802. He took his bride home from church on horseback, she being seated on a pillion behind him, with her arms round his waist.

Still theorising—attempting, among other things, to find out perpetual motion—he yet found time to get through much hard practical work. Thus, from mending shoes, he took to making them, and shoe-lasts also; and clock-cleaning was another of his occupations. Thirteen months after marriage, his son Robert was born; a short time after which event, the family

removed to Killingworth, seven miles from Newcastle. At this colliery, which is a very extensive one, George was appointed brakesman. Soon after their arrival, his wife died; a loss which affected George deeply, who cherished her memory through life with the most affectionate reverence. Shortly after, he accepted a temporary engagement in Scotland, from which he returned, after a year's absence, with twenty-eight pounds in his pocket, to find his father blind, helpless, and deeply in debt. Having paid the debts, he removed his parents to a small cottage near his place of work; where the aged couple lived for several years, supported entirely by George. Being drawn to serve in the militia, the remainder of his twenty-eight pounds had to be paid for a substitute to serve in his stead. This last blow brought him to the verge of despair. It seemed as if all his efforts to get forward were to be unsuccessful; and he had fully made up his mind to emigrate to America, but was unable to raise sufficient money to pay for his passage. He still went on experimenting, making models, and obtaining a thorough knowledge of his own engine. A new pit was sunk in the neighbourhood of the one where he worked; but the engine fixed for the purpose of pumping the water out of the shaft was unable to accomplish its duty; and neither the engineer nor any one in the neighbourhood could set it to rights. This went on for twelve months. At length, George, who had thought the matter over for several months, volunteered his services, which were accepted almost in despair; for what could be expected from a poor working-man, where so many educated brains had failed? In four days, however, a thorough cure was effected; and in two days more the pit was free from water.

In the year 1812, George Stephenson was made engine-wright at Killingworth, at a salary of £100 a year. He was now a good arithmetician, and an eager reader of any scientific works he could lay hands on. During the time he was at Killingworth, he invented several improvements in pit-machinery. Having experienced in his own case the want of a good education while young, he determined that his son should have nothing to complain of on that score. So Robert was sent to a good school at Newcastle; and, as soon as he was old enough, entered as a member of the Literary and Philosophical Institute of that town. The boy's progress justified his father's expectations. Like his father, he was fond of reducing his own theories, and those of other people of which he read, to practice. Wanting something to experiment upon, Robert one day selected his father's pony, and administered to it a severe electric shock, having prepared a kite and copper-wire conductor for the purpose. His father coming out on the instant, shook his whip at him, and called him a mischievous scoundrel, but chuckled inwardly at the lad's ingenuity.

As early as the middle of the seventeenth century, wooden rails had been laid down in various parts of the north, from the collieries to the water-side, to facilitate the transit of minerals between the two points, one horse being able to draw three or four times more over the rails than on an ordinary road. In the course of time, these wooden rails came to be plated with iron, and thus rendered more durable; and rails made entirely of cast iron were gradually introduced in various parts of the country. After a time, various scientific minds were attracted by the idea of constructing a machine to be worked by steam, which should run on these tram-roads, and supersede horses. Many engines of different kinds were built by various parties, some of them being entire failures, others having a partial success. Thus, in 1804, Captain Trevithick was considered to have achieved a great labour when he constructed a locomotive which would drag ten tons of iron after it at the rate of five miles an hour. Practically, however, this engine was a

failure, and had to be dismantled in a short time. In 1812, Mr Blenkinsop, of Leeds, constructed an engine which would drag thirty coal-wagons at a speed of about three miles and a quarter an hour. The great peculiarity of this machine was, that the driving-wheel was cogged, and worked into a toothed rail laid on the outside of the ordinary rails. All those who had hitherto turned their attention to the question, had worked on the idea that a heavy engine, constructed with a plain flanged wheel to run on smooth rails, would not be sufficiently adhesive ever to attain any considerable speed; in other words, that the wheels would slip round without biting the rails, and the locomotive come to a dead stand as soon as high-pressure steam was attempted. George Stephenson was the first to do away with this fallacy, which had been a stumbling-block in the way of all his predecessors, and to prove that 'the weight of the engine would of itself give sufficient adhesion for the purposes of traction.' At the Wylam Colliery, two or three engines of different kinds were tried with but indifferent success; and George, who had now bent the whole energy of his powerful mind to the locomotive question, went over frequently to see them work, and to study the principles on which they were built. He turned the subject over and over in his mind, and devoted month after month to patient investigation and preliminary experiments, all tending in one direction. Lord Ravensworth was called a fool by many people when, after listening to George Stephenson's statements, he advanced him sufficient money to construct a locomotive engine in accordance with his plans. There were still many difficulties to contend with; but on the 25th of July 1814, his engine was placed on the tram-road at Killingworth Colliery. It was constructed with smooth wheels to run on an edge-rail, was without springs, and had a water-barrel for a tender. It succeeded in drawing a weight of thirty tons up a considerable gradient at a rate of four miles an hour, and was 'the most successful working-engine that had yet been constructed.' Still, there was little or no saving over the cost of horse-power, neither was the speed greater than that which could be obtained on the old system, and George Stephenson's engine would have turned out little better than a failure, had he not made an opportune discovery which more than doubled the speed hitherto attained, without extra expense. His discovery consisted simply in making use of the waste steam—which had hitherto been allowed to blow itself away—to excite the combustion of the fuel, by adding velocity to the draught from the furnace, and thus create a larger volume of steam for working-purposes. He had scarcely made this discovery before he set to work to build a second locomotive; and, taught by his first experience, his second was constructed in so skilful and superior a manner, that it may in truth be termed the father of all succeeding locomotives, since its great fundamental principles remain in operation to the present day.

Soon after completing his second locomotive, George's attention was drawn to the number of fatal accidents occurring in pits from the explosion of fire-damp; and to the necessity of constructing a lamp which would afford the miners sufficient light to work by, and yet do away with the risk of explosion. He set to work, experimenting in his own way, and risked his life several times in the pit before he was satisfied that he had discovered the true principle on which such a lamp could be constructed. At length he discovered that a lantern, pierced with a number of small tubes at the top and bottom, and otherwise air-tight, might be burned in the foulest air without causing an explosion; and on this principle his lamp, which is in use in Northumberland to the present day, and is called the 'Geordy' lamp, in contradistinction to the 'Davy,' was constructed. It was first put to a practical use

towards the close of the year 1815, the same month that Sir Humphry Davy's discovery was announced to the world; and a long and bitter dispute afterwards arose between the partisans of Davy and those of Stephenson as to the priority of the invention. The grand principle of the Geordy lamp is the same as that of the Davy; the wire-gauze by which the latter is surrounded consisting, in fact, of nothing more than a number of minute tubes, through which explosion of hydrogen gas cannot force a way. A thousand pounds was collected by subscription, and presented to George Stephenson, in a silver tankard, at a public meeting of coal-owners at Newcastle, in token of their high opinion of the value of his invention.

Not satisfied with what he had already effected in the way of engines, George invented several important improvements during the next few years in the working of his locomotive, which our space forbids us to do more than mention. Although his engines were in constant use on the Killingworth Railway for a number of years, yet they excited but little attention, and were scarcely known beyond the immediate neighbourhood. In fact, the great problem at that time, with those who devoted themselves to the matter, was to construct a locomotive which would work on ordinary roads; and the idea of constructing an iron road from one town to another was regarded as something visionary. Mr Edward Pease, of Darlington, had seen for some time the need of opening up a route between the port of Darlington and the vast beds of coal in the Bishop-Auckland valley; and a tram-road between the two points, worked by horses, seemed to him the best mode of communication. Accordingly, the Stockton and Darlington Railway Company was gradually formed; the shares being chiefly taken up by Mr Pease's own relatives and friends, the public being averse to risk their money in such a harebrained project. A bill was laid before parliament, and, after considerable opposition, was passed in the session of 1821. George Stephenson, hearing of the projected railway, made application to Mr Pease with the view of being appointed to superintend the formation of it. It being found necessary to make a fresh survey of the country through which the proposed line was to run, George was intrusted with the duty. In his report thereon he recommended several alterations and deviations from the route proposed, which necessitated an application to parliament for an amended act, in which, at Mr Stephenson's urgent request, a clause was inserted empowering the company to work the line by means of locomotive engines, and to employ them for the conveyance of passengers as well as merchandise, if needful. The act having been obtained, George Stephenson was appointed engineer, at a salary of £300 a year. The line was opened on the 27th of September 1825, and was worked partly by stationary and locomotive engines, and partly by horses. The first passenger-carriage was an old coach body, mounted on railway wheels; and some years elapsed before regular passenger-trains were established. While the line was in the course of formation, George Stephenson and Mr Pease entered into partnership, and opened a locomotive manufactory at Newcastle—for several years the only factory of the kind in existence—and, though commenced on a very small scale, destined in the course of a short time to swell into gigantic proportions.

The necessity of additional means of transit for goods between Liverpool and Manchester had long been felt, and frequently discussed by those interested in the matter. The Mersey and Irwell canals were at this time the sole means of conveyance between the two towns. The rates were preposterously high; the time taken to perform the journey averaged thirty-six hours; and the means were so inadequate to the necessities of the time, that the Liverpool warehouses

were frequently blocked up with cotton, while the mills in Manchester were standing idle for want of it. In the year 1824, the question took a tangible shape: a committee was formed, a prospectus issued, a share-list opened, and George Stephenson was unanimously appointed engineer; though it was still a question whether the projected line should be worked by steam or horse power. Even those most in favour of steam ridiculed the idea of conveying goods and passengers at a greater speed than nine or ten miles an hour; all except Stephenson himself, and he was requested by his own party to keep his 'absurd' views to himself.
